PRIL 28.—**Monifieth.**—HOUSES.—Erection wo houses at Ferry-road, Monifieth, for n Council. Schedules, &c., can be obtained Mr. D. Gowans, Town Clerk, Monifieth, his office, 26, Commercial-street, Dundee; om Mr. C. A. Mackenzie, Burgh Surveyor, fieth. Plans may be seen at office of itect, Mr. C. A. Mackenzie, Monifieth.

THE SCOTTISH BUILDER

BOYS FOR BUILDING TRADE

The negotiations which the Edinburgh Education Authority has been carrying on for some time with the Edinburgh, Leith, and District Building Trades' Association and the National Union of Building Operatives were brought to a conclusion at a conference held at the W. M. Ramsay Technical School to consider a suggested scheme for (1) encouraging boys to enter the building trades and (2) providing them with preliminary training. Over 40 representatives of the employers, operatives, the Education Authority, and the Merchant Company were in attendance. Mr. W. M. Ramsay, of the Education Authority, presided.

The scheme suggested, said the Chairman, provided that boys should be selected for preliminary training at the W. M. Ramsay Technical School, 20 each in masonry and bricklaying, 10 each in joinery and plaster work, and five in slaters' work; that the boys should attend the school daily, except Saturdays, for six hours, during six months; that this preliminary training should be accepted as an equivalent part of apprenticeship; that a maintenance allowance of 5s. per week should be paid to each lad during the six months, to be repaid by the employer to whom the lad was eventually allocated; that the training should include theoretical as well as practical indoor and outdoor instruction, the proportion to be settled by a committee composed of six representatives each of the employers, of the operatives, and of the Education Authority, with a representative each of the Merchant Company and the Heriot-Watt College, and that a grant should be asked from the Government.

Lord Dean of Guild Forrest; Mr. Watson, President of the Master Builders' Association; Mr. Gove, Secretary of the National Federation of Building Operatives, and Councillor Allan expressed general approval of the proposals. Eventually the following resolution was moved by Mr. Watson, seconded by Mr. Gove, and unanimously adopted, viz.:—"That this conference approves generally of the suggested scheme for encouraging boys to enter the building trades and for their preliminary training at the W. M. Ramsay Technical School, and remits to a joint committee of representatives of the masters, operatives, and the Education Authority to work out the scheme." A vote of thanks was accorded to the Chairman on the motion of the Lord Dean of Guild.

NEW BUILDINGS IN SCOTLAND.

Dunoon.—EXTENSIONS.—It is proposed to carry out some improvements at the Cottage Hospital, which include the erection of a lodge and the extension of the operating room.

Coatbridge.—ACCOMMODATION.—The Lanarkshire E.C. propose to ask the Catholic authorities to submit a report with regard to additional accommodation required at St. Augustine's R.C. School, and also as to the advisability of erecting a new school adjoining the existing school in Kildonan-street, Coatbridge.

Glenboig.—SCHOOLS.—The Lanarkshire E.C. has instructed the Master of Works to prepare plans for a new schoolhouse in connection with the Glenboig School. The authority has also recommended the Catholic authorities to erect a new infants' school in connection with the Glenboig R.C. School, which would form the nucleus of an entirely new school.

Elgin.—HOUSE.—The T.C. has passed plans submitted by Mr. W. Morris, Aberlour, for a house at Victoria-crescent; and also for additions at the George Restaurant, Batchen-street.

Aberdeen.—HOSPITAL WORK.—At a recent meeting of the Hospital Committee of the Aberdeen District Board of Control plans and specifications for alterations and additions to Kingseat Mental Hospital were considered, and after making a few minor alterations to the plans the Committee agreed to remit them to the General Board of Control in Edinburgh for approval.

Paisley.—HOUSES, &C.—The Dean of Guild Court has passed the following plans: J. & J. Crangle, self-contained bungalow at Gartmore-road; W. Semple, self-contained house at Greenock-road; John Bryce, two tenements at Neilston-road; and R. W. Crawford, cottage in Calside-avenue.

Edinburgh.—BUNGALOWS, &C.—Plans passed by the Dean of Guild Court: Mr. A. Forbes, six bungalows at Queen's-gardens, Blackhall; A. L. Goodwin, bungalow at Corstorphine-road; G. A. Innes, bungalow at Brunton; G. S. Peat, bungalow at Midmar-drive, Morningside; W. & C. Skinner, four flatted villas at Craigleith-road; J. Sutherland, villa at Harelaw-road, Colinton; Alexander Sim, double villa at Riselaw-crescent, Comiston-road; W. A. Robertson, villa at Barnshol-road, Colinton; John M'Kay, double cottage at Queen's-road, Blackhall.

COMPETITIONS, CONTRACTS, &c.

NO DATE.—**Inverness.**—DEPARTMENT.—Various works of proposed new primary department at the Royal Academy, Inverness, for the Inverness County Education Authority. Schedules, &c., from Master of Works, 11, High-street, Inverness.

NO DATE.—**Lochee.**—ALTERATIONS, &C.—Alterations and additions to St. Margaret's School, Ancrum-road, Lochee, for the Dundee Education Authority. Schedules, &c., from Offices of the Authority, Shore-terrace, Dundee.

Fires.

Damage estimated at about £50,000 was caused recently by fire in the wool-spinning factory of Messrs. Alexander Bros., Ltd., Kilmarnock.

* These prices apply to *new buildings only*. They cover superintendence by foreman and carry a profit of 10% on the prime cost without establishment charges. A percentage of 1½ should be added for Employers' Liability and National Health and Unemployment Acts and from 1s. 6d. per £100 for Fire Insurance. The whole of the information given on this page is copyright.

RENTICESHIP ASSOCIATION

Council of the Skilled Employment and ıticeship Association recently issued its enth annual report. It states that during years there have been many signs through- e country of a revived interest in appren- p and of a desire to reintroduce the . New schemes of apprenticeship have, , recently been set on foot in different of the country in various trades, but a etermination manifested by both em- s and employed is needed to make these es a success. In many cases the period at whole time day technical schools is ed as part of the apprenticeship. A serious e of the present continued slackness of is the loss of skilled men due to their tion to the Colonies and the United and while in some trades the employers' tions are insisting that their members eep up their full quota of apprentices, ers the employers are unwilling to bind elves owing to the uncertain position ne rather antiquated state of apprentice- w, and are only willing to take learners re not indentured; in most trades, too, de unions by local agreements limit the r of apprentices in proportion to the ymen. This practice, while good in works out badly, and it is open to doubt er in a very few years even under the t slackness of trade the supply of crafts- will be found sufficient for our needs, in the event of a trade revival the nation rtainly find itself short of skilled artisans. n industry needs, the report continues, nen with brains and powers of invention, he future industrial well-being of the ry undoubtedly depends in a large measure dustry being able to command the services rkers endowed with a mentality and power iative of a high order; but many processes been so sub-divided and simplified by inery. even in highly-skilled trades that is great difficulty in providing an all- training in craftsmanship in the workshop he factory.

Association is awaiting with interest the ation of the details of the scheme of the ry of Labour for the after-care work of hildren leaving the elementary schools, is at present carried out by the London y Council.

GOVERNMENT HOUSING

onnection with the Government's Housing als, the Minister of Health, accompanied Under-Secretary of Health for Scotland, ly received representatives of various tions of the local authorities in England ales and Scotland, including the Associa- f Municipal Corporations, the Urban t Councils Association, the Rural District ils Association, and the Corporation of Scottish Boroughs. Representatives of ondon County Council were also present. inister made a full statement on the hous- estion and on the steps taken by the ment up to the present time in the ation of their housing policy.

sequently the representatives of the local ities in England and Wales and in Scotland ered the Minister's statement and in- d him that they had agreed on the follow- solution:—

hat, having heard the statement of the er. this Conference, representing the ation of Municipal Corporations, the District Councils Association, the Rural t Councils Association, and the London y Council, appoint a Committee to ne the points raised in the Minister's and the proposals contained in the t of the National House Building Com- and to report thereon to this Conference lso to consider and report (*inter alia*) State subsidy is necessary to enable local ities to proceed with the erection of for the working classes."

Scottish representatives concurred in solution.

TIDYING UP

the making of a fine city or town the well-considered lay-out of streets and open spaces and the design of buildings of architectural quality are not alone sufficient; important as they are. We have far to go in our practical and artistic education before we can venture to think n the lay-out or in the architecture of our cities the con- s will always be at hand for the easy attainment of either; architects and town-planners were not the optimists they arily must be their outlook would indeed be depressing. tectural design has never been more discussed than in times, and never, probably, has the general average of tectural attainment been higher, and we believe we can that we have in all parts of the country architects who dy to meet any demand which we can reasonably expect likely to get for better buildings from any improved taste in the near future; while never before, in this y at least, were there so many town-planning experts sight and imagination who are conscious of our needs ady to give us what we ought to have.

o of the greatest obstacles to progress and improvement well-being are apathy and ignorance, and it is these omings which make possible and which make us tolerate venly and untidy streets and public places. Many people ke a pride in their homes, where tidiness, cleanliness and are as necessary to their happiness as well-cooked food armth and comfortable clothing, are willing, in common hose who seem to prefer dirt to cleanliness and who make r a necessary detail in their daily life, to accept without n the avoidable dirt, untidiness and slovenliness of our ys and byways, our open spaces, our public buildings— lly our railway stations and their surroundings. People ence and of lesser eminence write eloquent and sometimes e letters to our daily papers, advocating some great improvement or reform which, at the best, will take carry out, while the little things that matter are ignored. little co-operation on the part of our leading citizens, f the small but none the less important evils every city from could be remedied, and yet which, for want of this ation, we have endured so long. With some such effort, e not prevent the practice of placing garbage receptacles eir contents along our streets to be emptied into refuse such a time as the business men and others are pro- to their work, or of lowering beer barrels into cellars ns of ropes which either arrest our progress or drive us road? With a movement similar to the "Don't spit" gn, which has had such successful results, should we find eets and public places littered with cigarette and match and our parks and public resorts made a wilderness of ss and litter on Bank Holidays and Sundays? A sus- and properly conducted campaign of enlightenment urely be successful in developing a public conscience in ter. The thoughtless destruction, in the Spring, of the n trees of Epping Forest should be just as much an as birds' nesting by boys.

re glad to think that these evils are being dealt with in by the Scenery Preservation Committee, which met at sion House last week under the chairmanship of the Lord Mayor, who remarked that he had had more messages in connection with the meeting than with any other meeting since he became Lord Mayor. We believe the best-informed public opinion is ready to support such a movement as well as the following resolution, which was unanimously carried:—"That this meeting, recognising the widespread and ever-increasing nuisance and injury to public amenities caused by the growing habit of littering public thoroughfares, parks, commons, and the countryside generally with waste-paper, cigarette-boxes, empty tins, picnic refuse, and other rubbish, and desiring to call attention to the need for the formation of a healthy public opinion opposed to such practices, undertakes to support the efforts of the Scenery Preservation Committee, and invites the co-operation of local and educational authorities, conservators of commons, and of all the societies, clubs, and other institutions interested in the preservation of scenery and the decencies of civilised life."

A number of messages in support of the object of the meeting from distinguished persons who were unable to be present were read. The Prime Minister wrote:—"You can depend upon my giving you every support of the kind you wish for your new venture. You put your finger on the right spot when you say that it is a conscience that is required and, I would add, a lively sense of the conduct which a person owes to himself as well as to other people."

The matter is of great importance, and yet of such a character as to appear to need nothing more than the support of leading citizens to ensure the success of the movement. No vested interests are involved and no heavy expenditure of money, but just that enlightened support and sympathy for a wholesome and necessary movement which has been started, but which needs to be directed to the end we have in view. The present is the time to take action, for as the Lord Mayor remarked:—"Now that the summer was approaching, it was desired to arouse public opinion to the need for putting an end to a great and growing nuisance. He was told that it cost the Office of Works £400 a month to remove the litter from the Royal Parks alone. The only remedy lay in the development of a sound public opinion in opposition to the practice, and if parents and guardians and teachers everywhere would set an example for the children to follow the object would soon be attained." Those excellent movements, the Boy Scouts and Girl Guides have already had instilled into them by practice that, when camping or bivouacking, their ground should be left as clean as they find it, or a little cleaner, and the matter might very well be taken up in our elementary and other schools.

What we want is a civic society in every town, for the question is one which cannot be dealt with successfully without the development of a civic sense. Advertisers have shown their good sense by removing disfiguring boards along our railways and roads, and now the public must do their part to make our public places clean and tidy and prevent a nuisance which they are largely responsible for, and which they can, in a large measure, control. Everyone must be aware that there are many needless and annoying excrescences in our towns in the way of projecting railings, areas, &c., which would really come within the power of our municipal authorities, and it is in such matters that civic societies could exercise a powerful influence

NOTES.

The R.A. Exhibition.

The Architectural Gallery at the Academy is somewhat of a disappointment this year. There is a lack of distinction about most of the subjects, and the general effect of the gallery is spoilt by three large models which are too large for the space—the effect would have been better visualised had they been smaller. Domestic work, which has so often provided special interest, does not make much appeal, though there are some quite nice houses shown, and ecclesiastical work is a very small feature in the collection. Business and public buildings are chiefly in evidence. We must admit that the public receive every year some sort of impression about modern architecture from the Royal Academy, such as they can find nowhere else, but in a mechanical age like this it is possible they are more impressed by the photographic representations, or misrepresentations, such as are to be found at the Empire Exhibition, than in the Academy collection of variously rendered drawings. When we consider how architecture touches us at every part in our daily life and how it leaves a record of our time in a concrete form for the future, it is to be regretted that the methods of sustaining and stimulating public interest in it are not better managed. We venture to suggest that a higher standard of work might be insisted on in the architectural exhibits, for we could readily exchange several of the present exhibits for some which have been rejected. So long as the chief principle of procedure in the hanging is to make an effective balance on the walls, we shall fail to get the best results.

The Proposed Amalgamation of the R.I.B.A. and the Society.

The scheme of amalgamation of the R.I.B.A. and the Society of Architects, which has been agreed to by the Councils of the two bodies, has been very favourably received by the profession, while a good deal of satisfaction has been expressed that there is now such an excellent opportunity of securing a really representative architects' Institute. The following letter, signed by all the surviving Past-Presidents of the R.I.B.A. who have held office since the year 1902, addressed to all members of the Institute, is an indication of the support which the scheme is receiving:—"We have read with great satisfaction that the Councils of the R.I.B.A. and The Society of Architects have agreed upon a complete scheme for the amalgamation of the two bodies. In our opinion this amalgamation will immensely strengthen the influence and authority of the Royal Institute, and we hope that it will receive the undivided support of our members. For many years this question has been under discussion, and a splendid opportunity has now arisen to settle on broad lines the difficulties of organisation and administration which the existence of two societies doing similar work has caused in the past. To secure the representation of the profession by one great Institute is an ideal we have always hoped to see realised, and we desire most earnestly to appeal to members to support the Council's scheme in every way in their power.—Yours faithfully, ... Webb (President 1902-1904), T. E. ... cutt (President 1906-1908), Le... Stokes (President 1910-1912), Reg... T. Blomfield (President 1912-1914), ... W. Simpson (President 1919-1921), ... Waterhouse (President 1921-1923).

Architecture and Modern Life.

The vital significan... the architect of the c... ing times is dwelt on ... article on "Archit... and Modern Life" in the Literary S... ment of *The Times*, and the write... gests that the architect who has pro... for a long time past been living und... patronage of wealth and could ... into being palaces must now l... reconcile himself to much s... affairs. Whether those architects ... have suffered under the economic d... ties of housing schemes will see i... a change for the better, we hardly ... A few architects have done fairl... with housing schemes, but it seems ... likely they will be able to repeat ... successes. As someone remarke... other day, it might be best to stand ... the whole business of housing an... on definite types of plans and constr... and let the whole business go o... shelling peas, and so, of course, eli... the need for any architects at all. ... enterprising firms are at work n... excellent housing schemes into ... architects of ability will be enab... infuse some artistic and individual ... but we fear this method will b... exception. By way of compensati... writer suggested that architects ca... on a really vast scale. Where ?... A very pertinent criticism of n...

Thaxted From a sketch by Mr. I. W Knight, A.R.I.B.A.

is that in domestic buildings the tect is happier and more truly sents humanity in his designs than usiness or public buildings. "The ces are that the house will be a ht to the eye and the town hall an cial exercise in lifeless design." The e notes, suggested by Mr. Chas. iott's book on "Modern English itecture," raise considerations of moment to architects. And it is asy to limit the view when we come iscuss the art of architecture in its ion to the public sense. We should o know how much that same public, h perhaps takes pleasure in our ging streets, would appreciate the ism implied in the remark, "With awful example of Kingsway before eyes it is almost incredible that nt-street should have been wantonly oyed."

Fixed ntracts.

The communication from Mr. Max Clarke, which we published in our last number, is a reminder that we be again on the threshold of another ling-scale contract" period. When s began to drop rapidly in the last ears we felt, with relief, that we had the last of another unpleasant relic he war. Is it not possible for the B.A. and the Builders' Federation to and devise some method by which practice may be avoided? There is inly no system more calculated to t the recovery of the building in- y or to alarm intending building rs. The industry needs every tonic an find, and anything calculated to as a sedative must be rigorously led in the interests of all parties in- ted in building, not forgetting the actor.

The ousing estion.

Amongst the plethora of advice and dictation about housing we now and then get a glimpse of lurid light he matter. Of such is a letter by Wolmer, who most emphatically tains that the remedy lies in cheaper s. Capital and labour, he thinks, ine to keep prices up, and he avers both wages and prices of materials come down. He asks how, when ng operatives earn £4 2s. a week, overtime, and engineers and miners 50s. and agricultural labourers 25s. we look for economic rents. He that subsidies (rising to the tune early forty millions per annum) t solve the problem. "Unless every- s wages are to be forced up by tion, so that they can afford to he rent the builders exact, the only on of the housing problem is to cheaper houses"; and, further, community should arm the Govern- with power that would prevent the building materials combine, rade unions, or unreasonable land- s from impeding the building of houses." We wonder if the general public realise that the country is not able to solve its pressing problems by adding steadily to its existing burdens.

Place Poissoniere, Chartres. From a sketch by Mr. F. W. Knight, A.R.I.B.A.

Indian Art.

There is no one who speaks with more appreciation of the native aspirations of our great dependency than Lord Ronaldshay, and his speech at the annual meeting of the India Society showed the same understanding. There were those who feared that with the establishment in India of Government schools of art under art masters recruited from England there would be a lack of apprehension of the characteristics of Indian genius, and the atmosphere of Indian thought and setting would be clouded by European influence and the more material characteristic of western art. The Indian Society of Oriental Art, formed in 1907, encouraged the work of the Tagore school, formed by the two brothers of the famous Indian poet, and Lord Ronaldshay, quoting from the statement of Mr. Gauuli that "its exponents sought to escape from the photographic vision, and the material objectives of life to secure an introspective outlook on things which takes one away from the material objectives of life," pointed out that they sought to maintain the deductive and essential characteristics of the art of India." But are such characteristics that of one nationality only, or those which underlie all that emerges as the purest in art. As art is in no particular time seen in its fulness, neither is it of a particular race or country, and the spirit which the Indian Society desires to foster for Indian art is the same as that which underlies the art of any race not held down by "material objectives." To understand and sympathise with this Indian point of view is to understand ourselves better.

Victoria and Albert Museum.

It will be a source of much gratification to students and craftsmen in the arts that the restrictions as to closing at the Museum—the result of the war—should now have been relaxed. The Museum will now remain open until 9 p.m. on Thursdays and Saturdays. To many craftsmen occupied with other business during the day this will be a great boon.

GENERAL NEWS

Professional Announcements.

Mr. W. H. Brewer has now joined Mr. Charles J. Ford, F.S.I., as partner. The business will be continued under the style of Ford & Brewer.

Mr. R. Kitching Ellison, A.R.I.B.A., has moved to 4, York Buildings, Adelphi, W.C.2.

Morley College.

Morley College is to be transferred from its present home, in Waterloo-road, S.E., to the site of the Old School of the Yorkshire Society in Westminster Bridge-road.

The lessees of the "Old Vic," which is now being enlarged and improved, have re-purchased from the Morley College the portion of the building with which they parted forty years ago. The purchase of the new building and its reconstruction to suit the needs of the College will entail an expenditure of £26,000.

Fordyce Academy.

The new secondary department, erected at a cost of approximately £7,000, was opened recently by Mr. L. F. Davidson. The new buildings form a separate school for the higher grade department, and consist of four class-rooms, science room, art room, assembly hall, and cloak rooms, with ladies' and gentlemen's staff rooms. The buildings are on modern lines, and were designed by Mr. Jas. Wood, A.R.I.B.A.

Clopton Bridge.

Representatives of the Warwickshire County Council, the Stratford-on-Avon Town Council, and of the Society for the Preservation of Ancient Monuments, waited on the Minister of Transport, Mr. Harry Gosling, recently, to discuss what measures should be taken to provide suitable facilities for traffic across the Avon, near Clopton. It was agreed that Clopton Bridge, the only crossing in that neighbourhood, was inadequate for the amount of traffic, but there existed divergence of opinion as to what steps should be taken to alleviate the congestion. The Stratford Town Council and the Warwickshire County Council wished to widen the present bridge, but the Society for the Protection of Ancient Buildings proposed that a new bridge should be thrown across the river higher up, thus preserving the beauty of Clopton Bridge. After hearing the views of the various parties, Mr. Gosling suggested that the Ministry of Transport, the Town Council, and the County Council should consult with the Ancient Monuments Board regarding the appointment of an architect to advise on the best course to be adopted.

Builders' Estates.

George Shears, of Bournemouth, retired builder and plumber (net personalty £12,335), £12,491.

Thomas Nash, of Heaton Chapel, builder (net personalty £1,490), £16,534.

Mr. Isaac Chambers, of 6, Willoughby-avenue, Lenton, Notts, joiner and builder, £8,490.

Mr. William Rhodes Atkinson (68), of Brookfield, Bingley, Yorks, joiner and builder, left net personalty, £23,411.

Ancient Arch in Burton Bridge.

The Burton-on-Trent Town Council decided recently to take no steps to preserve an arch of the ancient bridge across the River Trent unearthed during the operations for the widening of the present more modern structure. The arch had existed for probably 800 or 1,000 years. The Mayor, in presenting the report of the committee, said the arch had been inspected by a representative of the Society for the Preservation of Ancient Buildings, who advocated its preservation. The Committee considered three schemes prepared by the Borough Surveyor—one, to preserve the arch in its entirety at a cost of £500 or £600; another of a more modified character; and a third which would authorise removal of certain parts of the arch, so as not to interfere with the bridge widening. This last scheme, which would preserve the arch in part, so that it would be indirectly visible from the bridge, would cost £100, and the Committee recommended it for adoption. In the course of discussion it was stated that the arch was in a somewhat dilapidated condition, but there was already in existence at the other end of the bridge, situated on private property, a similar structure, in a better state of preservation and used, in fact, as a cellar. Archæologists could no doubt obtain permission to inspect the latter if desired.

MEETINGS

SATURDAY, *May* 3.

Edinburgh Architectural Association.—Visit to Trinity College Church and Cannongate Church, Edinburgh.

MONDAY, *May* 5.

Royal Institute of British Architects.—Annual General Meeting. At 9, Conduit-street, W.1. 8 p.m.

MONDAY, *May* 5—FRIDAY, *May* 9.

Town Planning Institute.—Exhibition and Conference. At Palace of Arts, Wembley.

TUESDAY, *May* 6.

Royal Institute of British Architects.—Annual Dinner. At Trocadero Restaurant, Piccadilly, W. 7 p.m.

WEDNESDAY, *May* 7.

Town Planning Institute.—Annual Dinner. At Savoy Hotel, Strand, W.C.2. 7.30 p.m.

COMPETITION NEW

Leeds Public Libraries.

The assessor, Mr. Percy S. Worth F.R.I.B.A., has made the awards in the follo competitions :—

BURLEY LIBRARY.—(1) Mr. G. B. How Oldham.

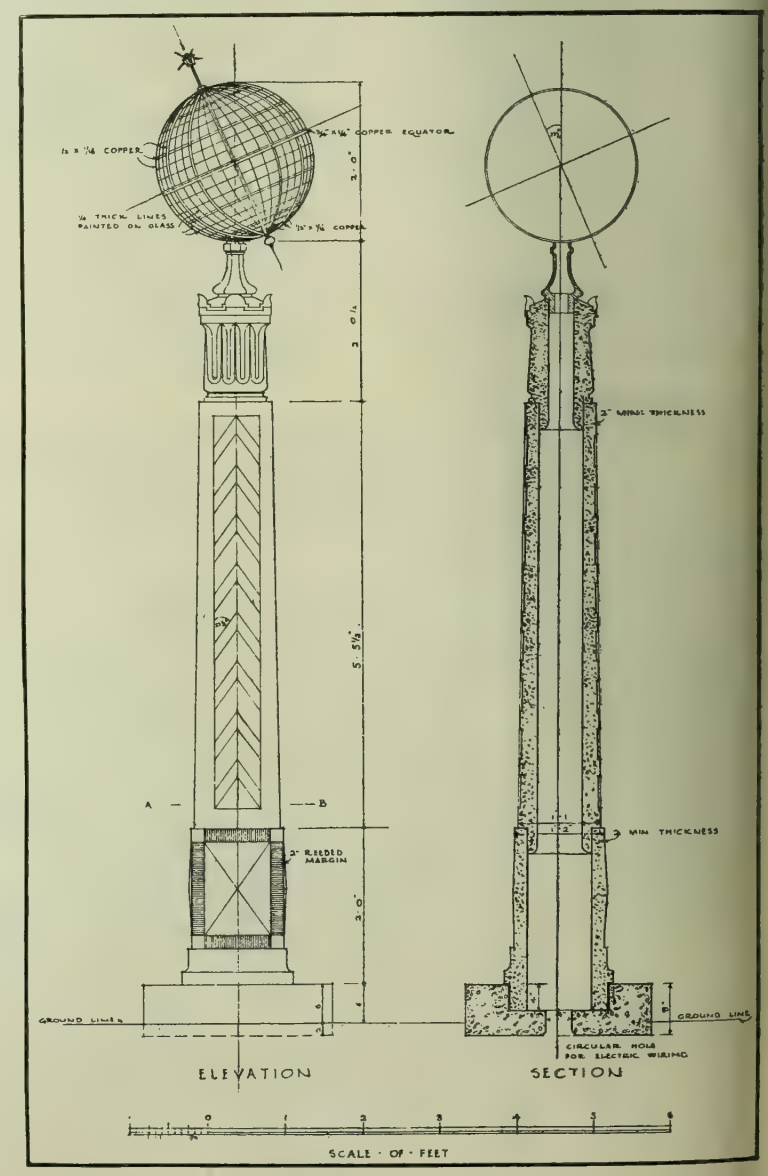
(2) Messrs. Foggitt & Addison, Leeds.

(3) Mr. A. E. Dixon, Leeds.

BRAMLEY LIBRARY.—(1) Messrs. Foggi Addison, Leeds.

(2) Messrs. Parkin & Sheffield, Leeds.

(3) Messrs. Kitson, Parish & Ledgard, L



The design placed first in each compet is given this week.

Public Hall, Glasgow.

Designs are invited for a public hall, to approximately £25,000. Premiums of £100, £75, and £50 are offered respecti A plan of the site, together with terms conditions can be obtained from the Offi Public Works, City Chambers, 64, Coch street. Sending-in day, July 4.

Other Competitions.

Other competitions still open include following (the dates given are, first the sen in date, and second the issue of *The Build* which full particulars were given) :—Indus Designs (June; Dec. 21, 1923). Ross-S Memorial (Sept. 30; Feb. 1).

Details of Concrete Posts: The British Empire Exhibition.

MESSRS. SIMPSON & AYRTON, FF.R.I.B.A., Architects. (*See p.* 721.)

LONDON TRAFFIC.—I.

By MAJOR HARRY BARNES.

London Traffic Bill is likely to mark an
n London Government. It establishes
verybody wants, the beginnings of a
sed control, though under a form not
ybody's liking. On that aspect, the
l aspect, I shall not say much here.
re, as may be expected, differing views
o which much time need not be given.
put, what is now proposed is a com-
between the English method of ruling
eas through elected representatives, and
tinental system of placing considerable
ve power in the hands of an official such
fect or a burgomaster. Each system has
ts. Our system in the long run rests
genuine standard of development of the
nity; the Continental system, by placing
rable power in the hands of a cultured
nay effect in a little while improvements
ch we have long to wait. We are very
here of powers given to official persons,
ntly so. We have always held strongly
iew that policy was to be settled by the
representatives of the community, and
e expert was to be confined to the
on of the policy.

London Traffic Bill shows a middle
The Minister of Transport, who is an
representative and is open to the control
iament, is to be the instrument of the
His powers under the Bill are limited, as
shown later, both in extent and in time.
overnment has promised to limit the
on of the Bill to three years. The
r is to be helped by an Advisory Com-
It is clearly intended that the Chairman
Committee is to be an official of the
y of Transport, and there seems little
hat Sir Henry Maybury is intended to
that position.

Committee itself will be comprised of
ordinary members and six additional
rs. Of the twelve ordinary members,
l be appointed by a Secretary of State,
the L.C.C., two by the City Corporation,
by the Ministry of Transport to repre-
e County Councils, County Boroughs
tropolitan Boroughs in the Traffic Area,
from nominees made by those bodies
o the Ministry of Transport. The six
ial members represent labour and
employed in traffic operations in the
ion of two and four, chosen after con-
n with these interests. The comment
his method of forming the committee
it is selective and not elective, and, if
put, should amount to the statement

mittee with persons likely to be amenable
ntrol.

rea over which the Minister is to exercise
ers is set out in the Act, and is roughly
with a radius of twenty-five miles from
Cross. It comprises the administrative
of London and of Middlesex and parts
ounties of Berks, Buckingham, Essex,
l, Kent, and Surrey.

s the machinery which the Bill sets up.
intended to be produced by it? Its
is connected with London traffic.
lan in the Street the question of London
mainly a question of waiting for buses
't come, or if they do come are full,
y are not full are held up at every street
y pedantic policemen who don't seem
e that the route one is on is always
portant than the route one is not on.
for 'buses. When it comes to tubes,
lan in the Tube it seems that at rush
ere are too few trains and at other times
y. He sees seats he cannot occupy, and
a straphanger by compulsion and not
e. For the trams he is thankful, his only
t being that they stop short of his
on or take him a too roundabout way.
es he finds there are neither buses,
r tubes, and learns it is because some-
her they don't pay, and in consequence
o operate them fail to receive what they consider to be their due, and so failing cease to operate at all. Then the man in the street gets out an old bicycle or begs a lift in a lorry or hoofs it, and calls a plague on everybody's house. That is the traffic problem, to take everybody where they want, when they want, how they want, and at a price within their means.

Do that and you will satisfy the folks on the street, but there are others. The labourer is worthy of his hire, and none are more conscious of that fact than those that furnish our traffic facilities. Then there must be dividends, and everything, wages, running costs and dividends must come out of fares. So this London Traffic Bill is to be passed, and I wonder what those who gather that somehow or other the promise of it helped to settle the tramway strike are expecting it to do. Let me endeavour to enlighten them. I hope their expectations are not set too high. If they are they will be disappointed. If the prominence given to the Bill has been considerable, its intentions are very modest. The positive powers it gives to the Minister are few. They are as follows :—

The first power deals with the nuisance created by the making of roads or road maintenance and improvement. These do undoubtedly create a nuisance. They place the most effective obstacles to traffic that could possibly be placed in the street. It will be recognised that adequate traffic facilities depend not only on the number of vehicles available, but the speed at which they can travel. Two vehicles travelling fast may make as many journeys as three vehicles travelling slow. Nothing makes for slowness so much as having the roads "up," and it is in the hope that he may prevent more roads being up than is absolutely necessary that the Minister is to be given certain powers over the local authorities. The powers are these: Twice a year all the local authorities in the traffic area are to give the Minister a statement showing how many roads they mean to have "up" in the next six months to the extent of one-third or more of their width.

All these statements are referred by the Minister to his advisory committee, and on their report the Minister may prohibit or restrict the execution of the works, and set out the order in which they are to be done, and so inform the authorities.

They may object within fourteen days and if they do the Minister is to consider, confirm or amend his order.

Of course, the local authorities are not the only offenders in the matter of breaking up the roads—the gas and water and electric lighting companies all do their share—so the Minister is empowered to send all such bodies a copy of the order he has made, and they must then do what work they want to do within the time in which the roads are up; if not, they must wait for another twelve months unless they satisfy the Minister they could not do the work when the roads were up, and that the work could not wait for twelve months. The local authorities are to be allowed to do emergency work as the need arises, and the statutory companies to make, alter or repair service connections. Last of all, these powers are only to be exercised in respect of certain streets which are to be prescribed by the Minister.

This is a very useful measure, if rather humdrum, and in so far as it removes some part of the delay caused by street repairs is an indirect augmentation of traffic facilities.

The second power is more modest still. It deals with a consequential effect of the breaking up of roads. After the Minister has determined what shall be done and the order in which it shall be done, there still remains the manner in which it is done. There is a tendency to "sprawl" in these matters, too much room is taken up by material, more than is necessary. Material is carelessly spread about and, generally, a greater obstruction is created than is reasonably required.

To remedy this the vigilant police officer is to be called in. He is to keep his eye not on what the road authority is doing, but on what the statutory bodies are doing in this respect, and if he thinks it necessary he is to report to the road authority, who is to inspect, and if he thinks it necessary to give the person concerned twenty-four hours' notice to mitigate the obstruction, and if the parties fail, the road authorities may step in and do the work themselves. The parties so notified have a right of appeal to the Minister, who must then consent or otherwise to the road authorities' action. This is again a useful provision, and on the principle that time saved is money saved, should be a boon to the traveller.

The next power is more important. It is a power given to the licensing authority to lay down the routes in the City of London and the metropolitan police district on which regular omnibus services may be established, with the power to fix their starting and terminating points. Having done this the licensing authority may attach to the licence of an omnibus all or any of the following conditions :—

(1) That it shall not ply for hire except as a regular service.

(2) That it shall ply on approved routes.

(3) That it shall not ply on approved routes or any part thereof.

All conditions are subject to appeal to the Minister, and the last condition may only be imposed on the ground that the 'bus is not suitably constructed or equipped for such a route.

The licensing authority is to have power, after they have fixed the routes, to call in all licences and affix the conditions stated to new licences.

The provisions in the Bill which follow are the most important of all. They are based on what may perhaps be termed the overt and the covert situations.

The overt situation is alleged to be that a large part of the congestion of traffic on the London streets in the central part of the City is due to the presence of too many 'buses. It is said that along certain routes the 'buses provided are more numerous than the traffic justifies, and that it would be in the interest of the traveller that selective action should be taken and the number of 'buses restricted to the number that the traffic demands. The covert situation is alleged to be that, having established a general system of 'bus traffic and extended it even beyond the limits of profitable return, the London General Omnibus Company now find their most lucrative routes invaded by competitive 'buses, which skim the cream of the traffic without undertaking the more onerous service that is entailed in providing for the suburban and more remote traffic. This is felt, and not unnaturally, as a grievance. No one who sees the competitive "'bus, occasionally copied from that of the L.G.O.C. down to the last detail, even to attempts to imitate the name, showing an ingenuity difficult to adequately characterise, and actually appropriating the route number which, if anything is the "goodwill" of a 'bus, but must sympathise with the feeling created. Such action has undoubtedly precipitated the situation, which came to a crisis in the recent tram strike, and hastened the introduction of a London Traffic Bill. Sympathy must not, however, obscure the importance of the action which the Traffic Bill proposes to allow, and its consequent effects upon the general community and the travelling public. With this I propose to deal in a concluding article.

Hospital Architecture.

We understand that a new method of treating in one building patients suffering from different infectious diseases without danger that infection will be transmitted from one to another has been installed at the London Fever Hospital, Islington. It consists, as it were, of a glass house in which patients with measles, scarlet fever and diphtheria are lying within a few feet of one another but they are all secured against cross-infection by thick glass partitions through which no microbes can pass. These partitions are also dust-proof.

CORRESPONDENCE

Westminster Abbey : North Transept.

Sir,—Under the Rose window is a passage which may be called the middle stage arcade. It has been rebuilt three times since about 1670. Some representations of the front made before this time agree in showing four bays of the arcade in the middle space and two in each of the side-aisle spaces.

From this and other evidence I concluded that the original arcades were divided thus | 2 | 4 | 2 |. Mr. Hurst Seager argues that the present division | 3 | 5 | 3 | suits the conditions better. Apart from record evidence I believe that the three bays in the aisle divisions of this arcade are out of scale and not in harmony with the Westminster "feeling," which is large and liberal. The sketches which I published in *The Builder* from a seal were made some fifteen years ago when it was first shown to me, and the proportions given to the arcade are no more accurate than rough notes are apt to be.

Looking at the existing arcade, it is quite difficult to think that there was originally one bay less in each space. On examining the three arches of the side-aisle spaces in detail, however, it will be seen that the openings are very narrow and narrower than those in the central space; even so the outer columns of the jambs are *left out* so as to get more width—it has obviously been very difficult indeed to squeeze in three bays. With the arrangement | 2 | 4 | 2 | the *spacing* was similar both at the sides and in the middle.

The exact *height* of the old arcade is not known, and the present one is crowned by a cornice-like moulding which reduces the height available, while all the passage floors in the church have only narrow string-mould fronts. Again, the mouldings of the arches intersect much where they meet above the springing: the main piers might well have been bigger so as better to separate the arches and clear out the spandrels more. Further, the arches of the triforium ranging with this arcade have wide arches struck from centres below the springing. Finally, there is the evidence of the remarkable distortion of the arches below this arcade done, as I pointed out, to bring these arches central with the spacing of the arcade above uniting with it in one whole, instead of having two narrow unrelated bands across the front. For myself I say again I accept the record of the old representations that the arcade was arranged thus | 2 | 4 | 2 |, and not as at present | 3 | 5 | 3 |.

In disputes it is difficult to keep any particular matter from becoming enlarged with irrelevancies and clouded by misunderstandings. In the first sentence of Mr. Hurst Seager's letter which concerns me, he says (italics mine): "In 'Westminster Abbey and Craftsmen' he condemns in good round terms the late John L. Pearson's restoration of the façade of the north transept *on the grounds that it was not in accordance with the original design.*" This is so contrary to what I regard as the right principle of guarding our precious ancient monuments, that for once I must try to correct the statement without undertaking further correspondence on these questions.

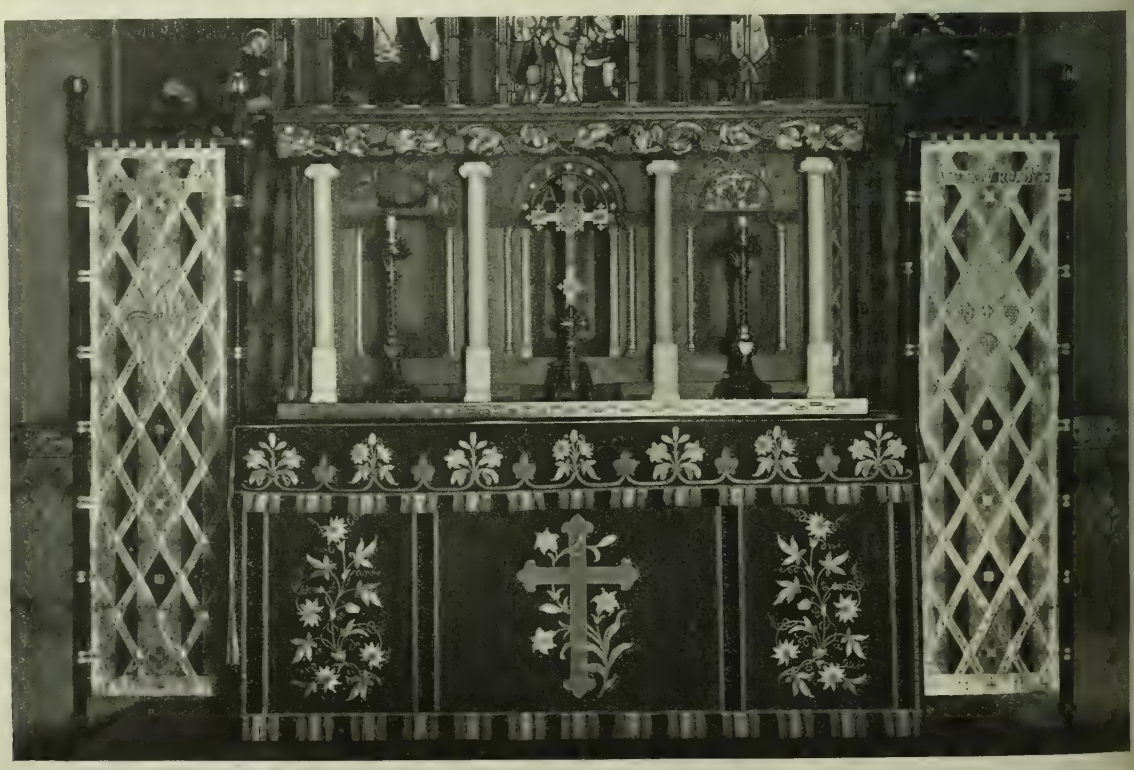
My view, as expressed in 1906, is that the front, partly mediæval and partly recased by Wren, should have been maintained as it was by careful repair. "The front still retained a good deal of original work, and the alterations often reflected in some degree what they replaced. The smile of the old work shone as it were through an ungraceful veil, and the whole front still possessed a certain lightness and spring." On the last great and thorough "restoration" I wrote: "*Continuity* is what we should advocate in opposition to all chopping and change. The gallery under the Rose has been restored in respect of the number of bays in accordance with Wren's work. I have nothing to say against this."

W. R. Lethaby.

Registration.

Sir,—During the discussion prior to the last R.I.B.A. Council Election you allowed me space for an attempt to voice the views of the smaller practitioners, and I venture to trespass again on your courtesy with a view to placing befo confrères some figures which I have c from the R.I.B.A. *Kalendars*, and wh think throw a considerable amount of li the real effect of the proposals recent forward by the Council.

All matters of governance are in these question of majorities, and it is th essential in considering the present pr to grasp the essential facts as to whe control of the Institute is *now* and/or wil the future. At the present momen majority of the corporate members Institute have entered it by examinatio figures being as follows:—



1. Fellows elected from the class of Associates	
Associates	
2. Fellows elected from the Licentiate class	180
Fellows directly elected before 1910	305
Fellows directly elected 1910–1923 inc.	11
Majority of corporate members who have entered by examination	

Even if the franchise is extended to the Licentiates corporate members the would still be in the same hands, as the would then stand—

Examined Fellows and Associates as (1) above	
Fellows as (2) above ..	496
Licentiates	1,402
Majority	

Under the present proposals, howeve control would pass to fresh hands as follo

Fellows as (2) above	496
New Fellows from "Society" ..	200
Members of "Society"	
Licentiates R.I.B.A.	
Total	

General View of Reredos and Hangings in Hillingdon Church. Executed by Mr. John D. Batten.

amined Fellows and Associates
as (1) above 2,814
jority of members who have *not* ——
passed R.I.B.A. tests .. 421

t must also be remembered that the Allied ieties are not likely to accept an inferior tus for their members (the majority of whom not members of the R.I.B.A.) than the ociety" has obtained, and if unification is to an anything it cannot stop at the present posals.

s far as I am aware no figures have been lished showing the actual composition of se Societies, and I therefore give them :—

	F.R.I.B.A. and A.R.I.B.A.	Lic. R.I.B.A.	Non-Members R.I.B.A.
ed Societies in ngland & Wales	711	225	893
itute of Ire-nd	15	3	121
ttish Incorpora-on	148	106	242
	874	334	1,256

n these figures then a further influx of 1,256 nbers may be anticipated who have hitherto n only affiliated and have had no member- in the Institute.

s the issue is presumably limited to the ted Kingdom, I have not mentioned the roximately 1,500 members of the overseas ed Societies who are not members or Licen- es of the R.I.B.A., although the circulars out by the Council are backed by repre- atives of the Cape and New Zealand.

n this connection it may be of interest to note , of the 45 additional names appended to Council's circular letter, 15 are those of lemen who are neither members nor Licen- es and, of these, two cannot be found in current *Kalendar* in any capacity.

lso the weight behind all these signatures is so great as might appear, since two names ear on behalf of a Society of only 21 members Associate R.I.B.A., 1 Fellow, 3 Licentiates, 16 non-members R.I.B.A.), and another esents 3 Associates, 2 Licentiates, and 26 members.

the aggregate they stand for societies having tal membership of 825 corporate members B.A. (who are not likely to be unanimous), Licentiates, and 1,533 non-members.

mention these facts because after all the al issue is a domestic one to the Institute its corporate members, and will be held by y to concern them and them alone.

the foregoing I have endeavoured to state without controversy, in the hope that so d they may be of use to my fellow members rally.

WILFRID TRAVERS.

Architectural Education.

t,—While appreciating the sympathy by Chitle in his letter of March 7, regarding tectural education in India, I would like rrect any false impression which he may conveyed by his criticism of the School of bay, which is recognised as the foremost tectural institution in India.

is true that the students are only called to work in the school for two hours every ing, which at first sight may not appear sufficient. It must not, however, be ten that they spend the rest of the day ce work, which affords them the opportun- f acquiring practical experience, this a part of the training. The authorities ally make arrangements for providing with this unique and valuable opportunity. ther feature of the School programme, is not mentioned by him, is the paying quent visits to the places of historical st such as Delhi, Agra, Ahmedabad and r, where the best examples of Indian ecture can be seen. The students even no expenses on these visits beyond that of

result created by this system is of so practical importance that many of the students of the School are seen doing responsible services and beneficial works throughout the length and breadth of India like any other Western qualified architect.

Referring to Mr. Chitle's plea for the teaching of the young architects in India on sound foundations, he does not mention the scheme already drawn by both Mr. G. Wittel, F.R.I.B.A., the late consulting architect to the Government of Bombay, and Prof. Robert W. Cable, A.R.I.B.A., F.S.A. It is a great pity that the scheme approved by the Government has not yet been carried into effect.

I agree with Mr. Chitle that the question ought to come before the coming International Congress, and the R.I.B.A. should use their influence on the Government of India for the advancement of architectural education in that country. If a representative is required, in my humble opinion Prof. Robert W. Cable is the most suitable personality on the subject, whose close attachment to the School and great enthusiasm for the young Indian architects is such that it cannot be spoken of without great respect and admiration. He is now in London and might consent to be a representative at the forthcoming International Congress if asked to do so.

H. H. KHAN.

London.

Ten Years of Construction.

SIR,—The paper by Mr. Ewart Andrews on "Structural Steelwork Reinforced with Concrete," reported in your issue of April 11 is extremely instructive. Some years since, in preparing the drawings for a large post-office, for which building there were certain objections to the use of reinforced concrete, as usually constructed, I went into the question of having light steelwork embedded in concrete, the steelwork being of sufficient strength to take the dead load and the combined strength of the steel and concrete taking the total load.

Making some researches as to whether anything of that nature had been done I found in the "Engineering Record" of September 7, 1907, a view and particulars of a reinforced concrete building in San Francisco in which the steelwork formed a complete unit and was erected complete before any concrete was applied. The steel frame consequently could be thoroughly examined by the architect or engineer and they could be satisfied that all was right before it was embedded in concrete. In the same paper in the issue of October 26 there was a description of the McGraw building, New York, in a paper by Mr. William H. Burr. The building was 11 stories high. The stanchions consisted of four angles connected by latticing, fitted in with concrete and with 2 in. external concrete as fireproofing material. The overall size of the stanchions to the lower story was 2 ft. 5 in. × 2 ft. 5 in., and of those to the top story 1 ft. 2 in. × 1 ft. 2 in. The concrete was 1: 2: 4 worked to 750 lbs. to the inch. The usual working stress for ordinary reinforced concrete columns in New York was then only 350 lbs. to the inch.

Stanchions of this type combine with great carrying capacity great convenience in erection. The steel may be erected ahead of the concrete and give support to the shuttering. The girders were reinforced with rods that had screwed ends passed through holes drilled in the angle steels of the stanchions and nutted. Some of the lower rods were turned up in the usual manner. The great point of the building was that all the steelwork was framed together, was complete in itself and did not depend upon the adhesion of the concrete.

I found in the transactions of the Institution of Civil Engineers a paper describing some warehouses in China that were constructed in a similar way.

Some object to reinforced concrete, as usually constructed, owing to the possibility of inferior workmanship, such, for instance, as all the rods not being in their correct positions, or the possibility of their being displaced by ramming, endangering the safety of the structure. When the steelwork is all previously framed these objections do not apply and probably, owing to the absolute certainty that everything is quite correct, it might be possible to work to a lower factor of safety.

The L.C.C. regulations require to be revised. At present concrete casing to steelwork is considered to be so much additional load instead of added strength.

W. J. H. LEVERTON.

London.

The R.I.B.A. and Amalgamation.

SIR,—I have received many communications and telephone messages from Licentiates with regard to the proposals of the Council. and shall be obliged if you will allow me to take advantage of your columns to appeal to all Licentiates to return their voting cards to the secretary without loss of time.

I have personally replied to the Council's question with an emphatic "Yes," and I find that the other members of our class, with whom I am in touch, are in entire agreement with the views of the Licentiates' Committee expressed in that reply.

There are no doubt one or two points of detail upon which we may have some suggestions to make in the future, but I think it would be a mistake to raise any questions, or discussions of any kind, at the present moment. Our policy, I think, should be to support the Council in every way possible in all the localities where we have representatives, and in the Press, wherever we can do so with any advantage. Since the Council's proposals will give us the vote and representation, any suggestions that we may have to make will come with much greater force in the future when we are equal to other Members, and should be left until we are in that position.

The proposals of the Council have generously recognised our claim to a voice in affairs without quibbling and without futile restrictions; and the Council has courteously invited us to express our opinions, and with equal generosity and courtesy I sincerely hope we shall reciprocate unanimously.

JOHN E. YERBURY.

London.

SHEFFIELD SOCIETY OF ARCHITECTS

AT the annual general meeting held on April 10 Mr. J. R. Wigfull presided. The minutes of the last meeting were read and confirmed, and Mr. H. Fieldsend and Mr. F. J. Powell were proposed and seconded as Associate Members of the Society. The annual report was read and approved on the proposition of Mr. A. F. Watson, seconded by Mr. F. E. P. Edwards. Mr. J. R. Wigfull proposed, and Mr. A. F. Watson seconded, that the annual statement of accounts be adopted. Mr. H. Webster and Mr. H. Nowill were appointed honorary auditors.

Votes of thanks to the retiring officers were then passed. The election of officers for the session 1924–25 resulted as follows :—President, Mr. H. L. Paterson, F.R.I.B.A.; Vice-President, Mr. F. E. P. Edwards, F.R.I.B.A.; Hon. Treasurer, Mr. R. Fowler, F.S.I.; Hon. Secretary, Mr. H. B. S. Gibbs, A.R.I.B.A. Council: E. M. Gibbs, F.R.I.B.A., T. Winder, Lic.R.I.B.A., W. C. Fenton, F.R.I.B.A., W. J. Hale, F.R.I.B.A., A. F. Watson, F.R.I.B.A., C. B. Flockton, F.R.I.B.A., J. R. Wigfull, F.R.I.B.A., W. G. Buck, Lic.R.I.B.A., J. Amory Teather, Lic.R.I.B.A., H. I. Potter, A.R.I.B.A., J. M. Jenkinson, A.R.I.B.A., F. H. Wrench, A.M.I.C.E., Lic.R.I.B.A., C. M. Hadfield, F.R.I.B.A., E. M. Holmes, B.Eng. F.S.I., A. Whitaker, J. C. P. Toothill, A.R.I.B.A.

The total membership now stands as follows:—One Honorary Member, 25 Fellows, 46 Associates, 2 Students, and 6 Lay Members, making a total of 80, as against 77 last year.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS

Notes from the Minutes.

We take the following notes from the Minutes of the Council meeting held on April 14 :—

Crafts Exhibition.—On the recommendation of the Art Standing Committee the Exhibition Committee was instructed to organise a crafts exhibition in the R.I.B.A. galleries in the course of the next session.

London Traffic Bill.—On the recommendation of the Town Planning Committee it was decided to transmit to the Minister of Transport an expression of opinion in favour of making the London traffic area as wide as possible.

Architectural Copyright.—On the recommendation of the Practice Standing Committee it was decided to support two members on cases of distinct infringement of architectural copyright.

Fellowship.—Under the provisions of By-law 12, Mr. H. S. Goodhart-Rendel and Mr. G. C. Lawrence were, by a unanimous vote, elected Fellows of the R.I.B.A.

Street Architecture Metal.

The jury appointed by the Council of the Royal Institute of British Architects for the award of the R.I.B.A. Street Architecture Medal has been reconstituted as follows :—

The Earl of Crawford and Balcarres (Hon. Fellow), chairman.
Mr. J. Alfred Gotch, President R.I.B.A., F.S.A.
Sir Edwin L. Lutyens, R.A., F.R.I.B.A.
Mr. E. Guy Dawber, Vice-President R.I.B.A., F.S.A.
Mr. Walter J. Tapper, F.R.I.B.A.

R.I.B.A. Lectures.

Mr. Sydney Perks, F.S.A., has altered the title of the lecture which he will deliver at the R.I.B.A. general meeting on Monday, May 19, at 8 o'clock, from "London Town Planning Schemes, 1666 and After," to "The Scheme for a Thames Embankment after the Great Fire of London."

Architectural Education.—The arrangements for the papers to be read and the discussions to be held during the International Congress on Architectural Education have been revised, and it has now been decided that papers shall be read on the past, present and future of architectural education in Italy, France, America and England. The Prince of Wales is to be patron of this Congress.

THE LONDON SOCIETY

ANNUAL DINNER.

On April 28 the London Society held its sixteenth annual dinner at the Hotel Victoria. The Rt. Hon. the Earl of Crawford and Balcarres presided. Among those present were : Sir Aston Webb, Major Chamier, Captain E. D. Chamier, Mr. Guy Cholmeley, Mr. W. R. Davidge, Mr. J. Scott Duckers, Lady Hughes, Mr. and Mrs. C. Lewis Hind, Sir Arthur and Lady Holbrook, Sir John P. Miller, Sir Henry and Lady New, Sir Alfred Rice-Oxley, Lady Riddell, Sir John Simpson, Sir James L. Walker, Sir Reginald Blomfield, Sir Harry Brittain, M.P., Sir Frederic G. Kenyon, Mr. W. Pett Ridge.

After the loyal toast had been honoured, Sir Reginald Blomfield said he would like shortly to recapitulate the position in regard to the City churches. On the one hand they found ecclesiastical authority embarking on a campaign of spoilation ; on the other hand another body opposed to this campaign. When a thing was wrong in principle details were largely immaterial, but one of the most conspicuous features of this measure was that the City churches were not "pulling their spiritual weight," because they were filled only to a small extent on Sundays. That was perfectly natural, because a great part of the City was absent on Sunday. But what the promoters of the measure did not state was that a tremendous part of the work was done on weekdays, when the churches were a haven of rest for many over-worked men and women in the City. That was a very vital and important work and should be better known than it was.

The sites of the churches were very valuable property, and the authorities seemed to think that they could deal with them as they liked—that the Church could do what it liked with its own. They conceived the Church as composed of the whole body of its members, lay and clerical, and from that point of view they objected very strongly to this property being dealt with in a manner that was incompatible with the duties of trustees. If the Church pulled down what it knew was extremely valuable property, there was nothing to prevent it doing the same thing with St. Paul's Cathedral or Westminster Abbey, or the Colleges and Foundations, and dividing the proceeds among themselves. That was a very dangerous thing, for, after all, custom was not a mere scrap of paper. When they talked about pulling down churches and re-erecting them they did not fully understand the situation.

With regard to the bridges there were three in the arena. He was of opinion that Lambeth was an absolute necessity, having regard to the work thrown on Westminster Bridge. The whole question of London bridges was a most difficult one, and could not be settled by methods years behind the time. If a building fulfilled its condition satisfactorily it was good architecture. Waterloo Bridge was the most admirable structure in the world, but was designed for totally different conditions from those that obtained to-day. He walked across it five days a week, and had regarded it from every point of view, but did not believe that its widening would have any material effect on its appearance.

Every person of intelligence was opposed to the St. Paul's Bridge because it would imperil the foundations of the Cathedral. He was opposed to it because it would endanger Wren's incomparable masterpiece. He regretted that the Charing Cross Bridge idea seemed to be vanishing, and although he hoped that they were still struggling on he confessed that he was rather pessimistic. They suffered from a lack of foresight on the part of their predecessors and themselves. They had a distinctive habit of dealing with things as they came along and in detail, instead of treating them as one big comprehensive scheme.

Sir Harry Brittain, M.P., said when coming back to London he always felt he was coming back to the most interesting city in the world. However, it was true they were the untidiest city in Europe. The only remedy was to establish a consciousness in the minds of the people. It was as important to get rid of litter as to have pure water and food. Another aspect was the smoke of London. He suggested there was nothing the Society could take up with such prospect of immediate success as the doing away of the filth in air. It was always dangerous to prophesy, but he believed with the aid of British science smokeless fuel could be manufactured on a commercial basis within a period of twelve months. If the Society could help in those matters it would indeed deserve well from the citizens of London.

Mr. Lewis Hind, Sir Frederic Kenyon, and Mr. Pett Ridge also spoke.

The Chairman, responding to the toast of his health, proposed by Sir Aston Webb, said they were all agreed the London churches must be religiously preserved. He was all for tidiness ; all for improving the exteriors and interiors of their buildings. The Society now had 1,200 members, and its work was well known. There was much to be done. They needed 5,000 members. After all, surely there were that number of lovers of London. There were critical times in front of them, but he believed great results could be achieved if they received the support of the public to which they were so richly entitled.

THE ARCHITECTURAL ASSOCIATION

A GENERAL meeting of the Architectural Association was held at 35, Bedford-square, W.C.2, on Monday evening, Mr. E. Stanley Hall, F.R.I.B.A., in the chair.

The following were unanimously elected members :—

A. D. Connell — M. J. H. Somake
B. R. Ward — D. D. Robinson

Mr. V. Newton Moss and Mr. R. S. C were reinstated as members.

The Council's nominations for the House for 1924–5 were announced as follows :—

President : Mr. H. S. Goodhart-Rendel.
Vice-Presidents : Messrs. J. Alan Slater L. S. Sullivan.
Hon. Treasurer : Mr. Gilbert H. Jenkins.
Hon. Editor : Mr. Manning Robertson.
Hon. Librarian : Mr. A. H. Moberly.
Hon. Secretary : Mr. M. T. Waterhouse.
Past President : Mr. E. Stanley Hall.

Ordinary Members of Council (10 *to be elected*) Messrs. W. H. Ansell, A. S. G. Butler, A. Edwards, J. M. Gatti, C. L. Gill, P. D. Hepwo Joseph Hill, C. H. James, A. B. Knapp Fis E. J. T. Lutyens, H. I. Merriman, O. P. Mi F. W. Newman, S. C. Ramsey, A. B. Ll. Robe W. Scotter Owen, Philip Tilden, C. Co Voysey.

Dr. H. Crichton Miller, M.A., then gave address entitled "The Rôle of Phantasy Life." He pointed out that psycholog found it convenient to classify phantasy u three headings : (1) Compensatory phant characteristic of childhood and exemplifie the case of an ill-treated child who loo forward to the time when it would be str enough to get its revenge on its torment (2) inspiratory phantasy ; and (3) crea phantasy. Creative phantasy, he said, c rather from the sub-conscious mind, and ceived things of which the conscious mind incapable. In recommending architects cultivate creative phantasy, he urged them to do so altogether at the expense of the ma of-fact and objective mind. Creative phan might produce a house which, although it m satisfy æsthetically and be quite unlike anyt else, would be deficient of such an esse feature as a scullery, while the house prod by the practical man who had no cre phantasy would probably be as perfect could be in its sanitary and domestic arra ments, but would not satisfy the eye æ tically. It was therefore necessary to fus two, and the most successful architect w be him who combined creative phantasy the practical requirements of life.

In the ensuing discussion, Mr. Stanley H said he felt very much in sympathy wit lecturer's views, but a difficulty in giving to phantasy lay in the fact that the would not always accept such a point of It was sometimes discouraging when an a tect told his client that he proposed to ex his phantasy only to be informed that the did not like it, or had a phantasy of his ow

Mr. A. H. Moberly said he would lik compare the lecturer's point of view wit views of Professor Lethaby, who felt tha one hope of present-day architecture l architects keeping their minds conscious purely practical aims.

EXHIBITION NOTE

The British Industries Fair is again op the tenth consecutive year and will ass form a most useful function for British It is only necessary to traverse the many of the Exhibition to realise what great po ties for trade lie in all these many exhibits. pottery show does not strike one as quite a as usual, but it is evident a large num manufacturers are at work. Some of the are very effectively designed, as those Moorcroft Co. and Birks, Rawlins & Co. great Exhibition at Wembley should bring increasing numbers to our Empire Window at the White City.

EVERYDAY ARCHITECTURE

'HE author* addresses this sequence of essays he public, and all architects and builders owe a debt of gratitude for this attempt stimulate public interest in the beauty or ness of their surroundings. Architecture is languishing from lack of skill or knowledge; quires opportunities, and opportunities must made. We have frequently doubted the dom of trying to educate the public by supply- drawings of houses and details which they uire for a few shillings and think they can oduce through a local builder, regardless of ition, aspect or local conditions. Mr. ertson—wisely, we think—depends upon nd common sense reasoning in his appeals to public. The vicissitudes of domestic archi- ure often seem exhausted as a subject, but n the author has courage and freshness of ression, the subject comes up again with a appeal. The author is essentially modern in outlook; he has something to say, as well he power of saying it. He is nearly always nite—an excellent quality in an architect— n it is so easy to be negative in architectural ters. The writing is forcible, with a touch umour, qualities which give the book a par- lar value to those who seek a livelier delight architecture. The author covers a wide ge of subjects in the eighteen chapters in the k, and from a literary point of view they eal to us as serious contributions upon netic and philosophic criticism advanced by eone in authority, rather than as a "sequence ssays." The book deals broadly with the le subject of our everyday environment, and attitude throughout is, in the main, consis- . The case against all forms of ugliness is ed, and remedies and improvements are gested on practical lines. "We must not t ugliness," he says, "as if it were either nomical, practical, or inevitable." He deals n the clearing of the slums, with advertise- nts in public places, and with smoke filth and recalling to our minds the words of the nortal Alice:

"If only these were cleared away
It really would be grand."

Many excellent and suggestive points are ed and discussed shrewdly, such as: the uiry whether the style of cottage design ved mainly through the Government housing mes is only a matter of passing fashion; suggestion that one practising architect can lly be expected to criticise frankly and y the work of a brother architect; the lady former" who instructs us in public con- ing the sort of house women want and h men have prevented them from having; that in the supply of houses at lowest cost overnment department nor public body can the speculative builder.

e agree with the author in his comments n the general level of public taste, although public may find a difficulty in understanding se of the words "practical," "economy," "materialism," in relation to architectural gn. Wren, he says, was practical in the true e of the word; he achieved the best results the materials and funds available, but we the fear that an ignorant public will not nguish the difference between best results apparent value for money. It is evident the author has a clearer conception of the itectural significance of "economy" and ctical utility" than the speculative builder. eel we are moving on the right lines when ear an architect telling us that the move- towards directness of expression in archi- re is partly the result of a search for strict omy, and that if practical utility had been ed to its logical conclusion we would not the modern parlour and suburb.

. Robertson makes clear the distinction een the speculative builder and the jerry er, and the majority of thinking people d agree with him that the speculative builder of the last century merely provided what the public expected and wanted. It is rather an unfortunate conclusion to come to that there is no one in particular who can be held responsible for the ugliness of our modern towns, and it seems a hopeless business waiting for public taste to improve. We like the idea of the suggested triple alliance between the public, the builder, and the architect, and we wish the author had outlined some working scheme on these lines. He would make an excellent liaison officer. No greater service could be rendered to this country than an arrangement which would save us from another avalanche of vulgar, depressing houses similar to those of pre-war days, proclaiming the hopelessness of our social conception of civilisation. Sound advice is given to the builder of small houses. The author advises him to curb the irresponsible demands of the purchaser, to set his face against shams, standardised decoration, and pretentious ornaments generally; in short, he advises him to build without affectation or "artistic fuss." No sounder advice has ever been given, and yet we would wager that nine out of every ten laymen would think these words were being addressed by the builder to the architect. In its search for a better England the public has much to learn, and this book will help to teach it many things.

The three sketches of houses on p. 29 should be an education to builders and the public. We would have preferred to head the first sketch Elemental (since Utilitarian does not connote lack of grace), and sketch 3, Proportion, Sense, and Utilitarian.

We are glad to see that the author considers the introduction of a new standard of housing to be of immensely greater significance than the economic failure of the housing schemes. We have always had the feeling that the real value of the movement was being obscured in the desire to obtain as much as possible through public funds as the main object, and afterwards—chaos. This feeling is borne out in Mr. Robertson's comment that we are subsidising houses out of public money without making any stipulation whatever as to the maximum number to the acre. He does not state that under the prevailing conditions failure was obvious from the beginning, and we are a little in doubt whether he considers the experiment can be continued and financially justified under normal conditions.

The author illustrates the difference between architectural control and the absence of it when he says that the housing schemes produced results of real permanent value, whereas the Grant to Private Persons produced miserable results. It is not easy to understand why he should assume that the economist gave his approval to this grant "without a guarantee that the taxpayers' money was being used to subsidise creditable work." From the purely economic standpoint the economist was opposed in theory to the whole principle of the subsidy in any form, but in face of the Rent Act and the state of public feeling the problem passed from the economist into the realms of the politician. The problem of how we spend our money is a social study, and it is entirely erroneous to suppose that the economist is interested either in the lowest priced house or in how the owner spends his surplus money. The author is severe upon the Victorian age for its worship of material prosperity; but making every allowance for the conflicting elements which appear when a new social order is being built up, we wonder what share of the blame falls upon the architect for these monotonous rows of pretentious villas which seem to be the fruits of snobbery and humbug. Did he not contribute by propagating his own particular form of pedantry?

A review of this book would be incomplete without a reference to the excellent introduction by Mr. Selley. He confines himself to the question of housing, and, incidentally, we think he touches the crux of the question when he asks what all the housing reformers were engaged on "during the halcyon days when materials and labour were cheap and the poor property-owner had ten per cent. of his houses empty on his hands." The replies might be that the great war taught us to think differently, or that it provided the opportunity to put the ideals into practice. Nevertheless, the sceptic is at liberty to doubt whether the means have not completely overshadowed the end. Mr. Selley tells us that builders will welcome every attempt to raise the public taste for something better in housing than that which they have been contented with in the past. This is refreshing news.

Mr. Robertson is to be congratulated on his book, which should make a general appeal to the public, and a special appeal to the builder and the architect. It comes at an opportune moment, and will be a distinct help in clearing up many points affecting the development of the housing problem, whether we continue in the future to build through the State or as individuals.

SCENERY PRESERVATION COMMITTEE

At a meeting of this Committee, over which the Lord Mayor (Sir Louis Newton) presided at the Mansion House recently, it was resolved to invite the co-operation of all bodies interested in preserving the amenities of the countryside in a campaign against various growing nuisances.

Mr. F. W. Jowett (First Commissioner of Works) apologised for his absence from the meeting owing to engagements in his constituency. "The subject you are considering," he wrote, "is one that has given much concern to my Department. That there is need for a strenuous campaign of enlightenment no one who visits our parks and open spaces, particularly after a Bank Holiday, can deny. It is sad that for want of a little thought so much of our beautiful countryside should be destroyed."

The Marquess Curzon wrote that he was heartily in sympathy with the campaign.

The Lord Mayor said that after a Bank Holiday the open spaces of London were littered with paper, tins and cigarette packets, and in the country the hedges and banks were strewn with the articles thrown away by occupants of motor-cars and chars-à-bancs.

Sir Martin Conway, M.P., then moved the resolution mentioned above, to which Mr. Hilton Young, in seconding, also protested against the "uglification" of the countryside. The char-à-banc, an excellent development in itself, was, he said, the principal cause of the growth of the nuisance, and one had to go farther and farther afield to reach undefiled country.

The resolution was carried unanimously.

[This matter is referred to in our leader of this week.]

Mr. Alfred B. Yeates, F.S.A., writing recently in the *Times* on this subject, said:

"Cannot the new Commission of Fine Arts quickly give a guiding hand to those responsible for the beauty of the London parks? In the last week, near Hyde Park Corner on the north side of the Row, a quiet open space of grass with surrounding flower beds has been sadly spoilt by a monument placed in the centre. The authorities have just started alterations to the fine circular sunk garden at the end of Mount-street. This, though not quite satisfactory, was at any rate in scale, and a pleasant feature in this rather level part of the park. Clipped hedges and a simple rearrangement of the flower beds would probably have sufficed to have made it more interesting. It seems a pity the public should have to bear needless expense on schemes open to criticism."

Hull's £300,000 Scheme.

Town-planning schemes involving the expenditure of approximately £300,000, were approved by the Hull Corporation Works Committee recently for submission to the Government Unemployment Grants Committee.

ILLUSTRATIONS

R.A. Exhibits.

We illustrate this week two exhibits at this year's Royal Academy Exhibition, namely, "Rebuilding of Nos. 36-44, Moorgate-street, E.C., for the Ocean Accident and Guarantee Corporation, Ltd." (Sir Aston Webb, P.R.A., & Son, architects); and "Project for a London Site," a study by Sir Edwin L. Lutyens, R.A.

Libraries at Leeds.

We give this week the first premiated designs in the competitions for branch public libraries at Burley and Bramley, Leeds. The design placed first for the Burley Library is by Mr. G. B. Howcroft; for the Bramley Library the design of Messrs. Foggitt & Addison has been accepted. The full result is given on p. 708. The work of erection of the libraries will be carried out under the direction of the authors of the designs placed first, subject to the approval of the Carnegie United Kingdom Trustees, who have made grants to the Leeds City Council in respect of these libraries.

Bristol Cathedral's New Vestries.

On Saturday last, April 26, the Bishop of Bristol dedicated the recently completed addition to the Cathedral buildings. The work forms the most important part of the scheme of renovation that has been in hand since the autumn of 1922.

The building, illustrated this week, has been erected and planned to provide much-needed vestries, and to occupy the site of the destroyed monastic buildings on the east side of the cloister, and brings back to something of its former appearance the range south of the Chapter-house that in pre-suppression times included the monastic dortor and its sub-vault. The chief building is about 56 ft. long and 32 ft. wide, and includes vestries for the Chapter, Honorary and Minor Canons, Lay Clerks, and Choirs.

In addition, a new library has been built over a room, formerly perhaps the "warming-house" of the monastery, and adjoining the new vestries at the south-west angle. Between the vestries and the Cathedral, the passage forming the old communication between the dortor and the church (by means of the "night stairs" in the south transept) has been opened and repaired.

The materials used throughout are Brandon Hill rubble for the walls, and dressings from the quarry on Dundry Hill. These materials were almost exclusively used in the old portions of the Cathedral buildings.

The work has been carried out by the contractors, Messrs. William Cowlin & Son, of Bristol, from the designs and under the personal superintendence of Mr. Roland Paul, F.S.A.

The heating forms part of the scheme for heating the Cathedral buildings, carried out by Messrs. G. N. Haden & Sons, of Trowbridge, and with the electric light installation by the Colston Electrical Co., has been under the superintendence of Mr. Malcolm T. Evans, consulting engineer.

The glazing, including new heraldic glass in the Chapter vestry, has been executed by Messrs. Joseph Bell & Son; the metal-work by Messrs. F. & R. Edbrooke, and the plumbing by Messrs. H. A. Pritchard & Son—all of Bristol.

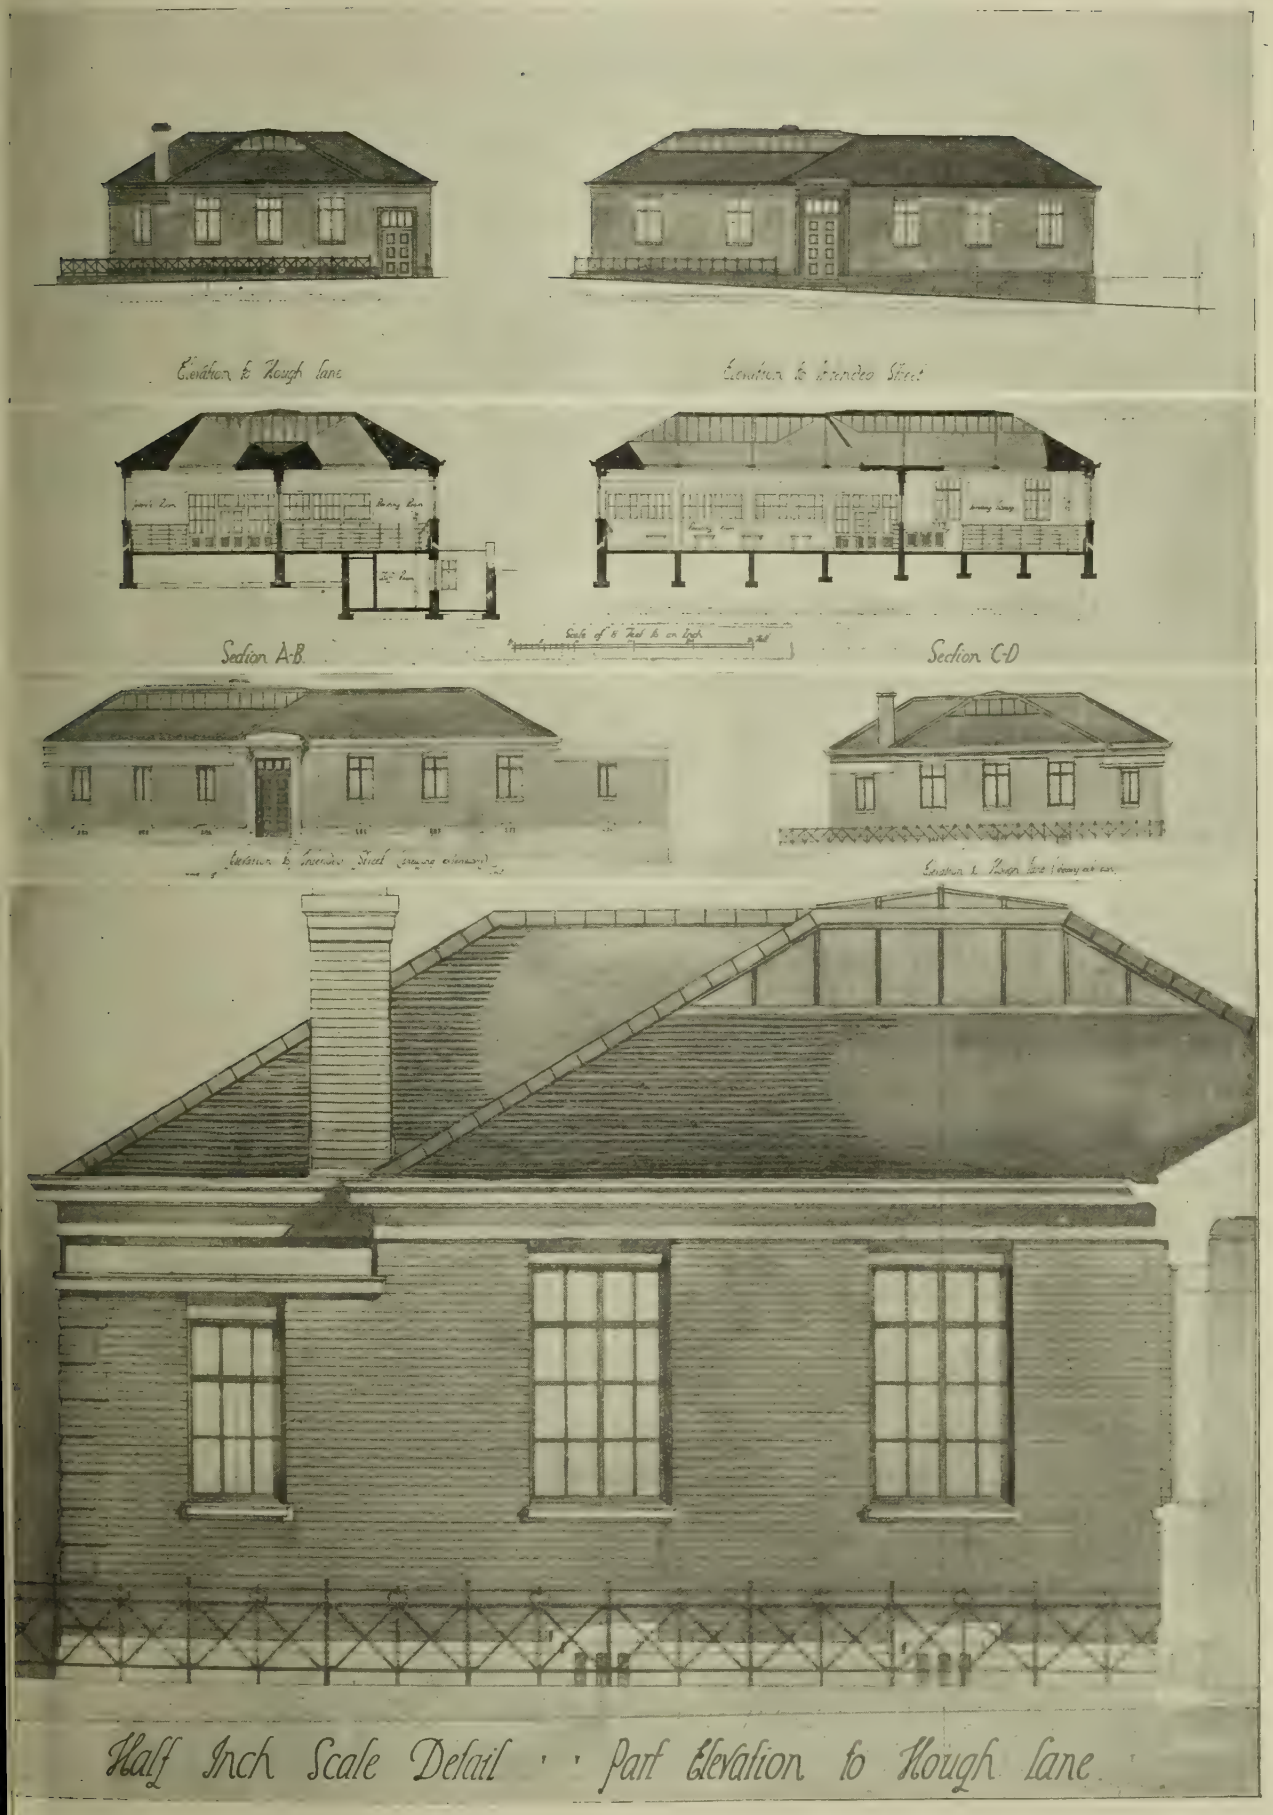
The "Fortune" Theatre.

Built on a site in Covent Garden, this is the first theatre to be built in this country since the war. It is called "The Fortune," thus reviving the name and the memories of the famous house in which Shakespeare acted. The theatre has been built for Mr. Laurance Cowan, the playwright.

The present building adjoins the Scottish National Church in Crown-court, which has a right-of-way through the whole length of the site from Russell-street to the gallery exit of the church, and has made the planning of the theatre difficult. Allowance had to be made for this passage, which measures 9 ft. in width, and the site charter permitted building under and over it. Without this passage the site measured only 3,430 sq. ft., and this is the real space available for auditorium and stage. The smallness of the site necessitated a choice of construction which would yield the greatest saving in space, and after careful consideration ferro-concrete was decided upon, without any facing of brick or stone. The consequence of this is that actually only 5 in. of ferro-concrete separates the upper circle wall from the building line. The concrete was made of Derbyshire pearl spar and "Atlas" white cement, and the whole face was finally bush-hammered with automatic tools. The London County Council Regulations demanding at least seven days before centering is struck prevented effective brushing and washing, and the automatic tool was resorted to out of sheer necessity. Otherwise, the concrete face would have presented a much more colourful and sparkling appearance, since any tool work on spar or marble has the effect of deadening the refractive value of the material. The windows are made of mild steel, and the frames are set in the face overlapping the concrete, the windows being thus more or less flush with the building line. This saves special reveal work. No attempt has been made to mould the concrete in any way, and the only ornamentation introduced has been done by ribbons of cast lead.

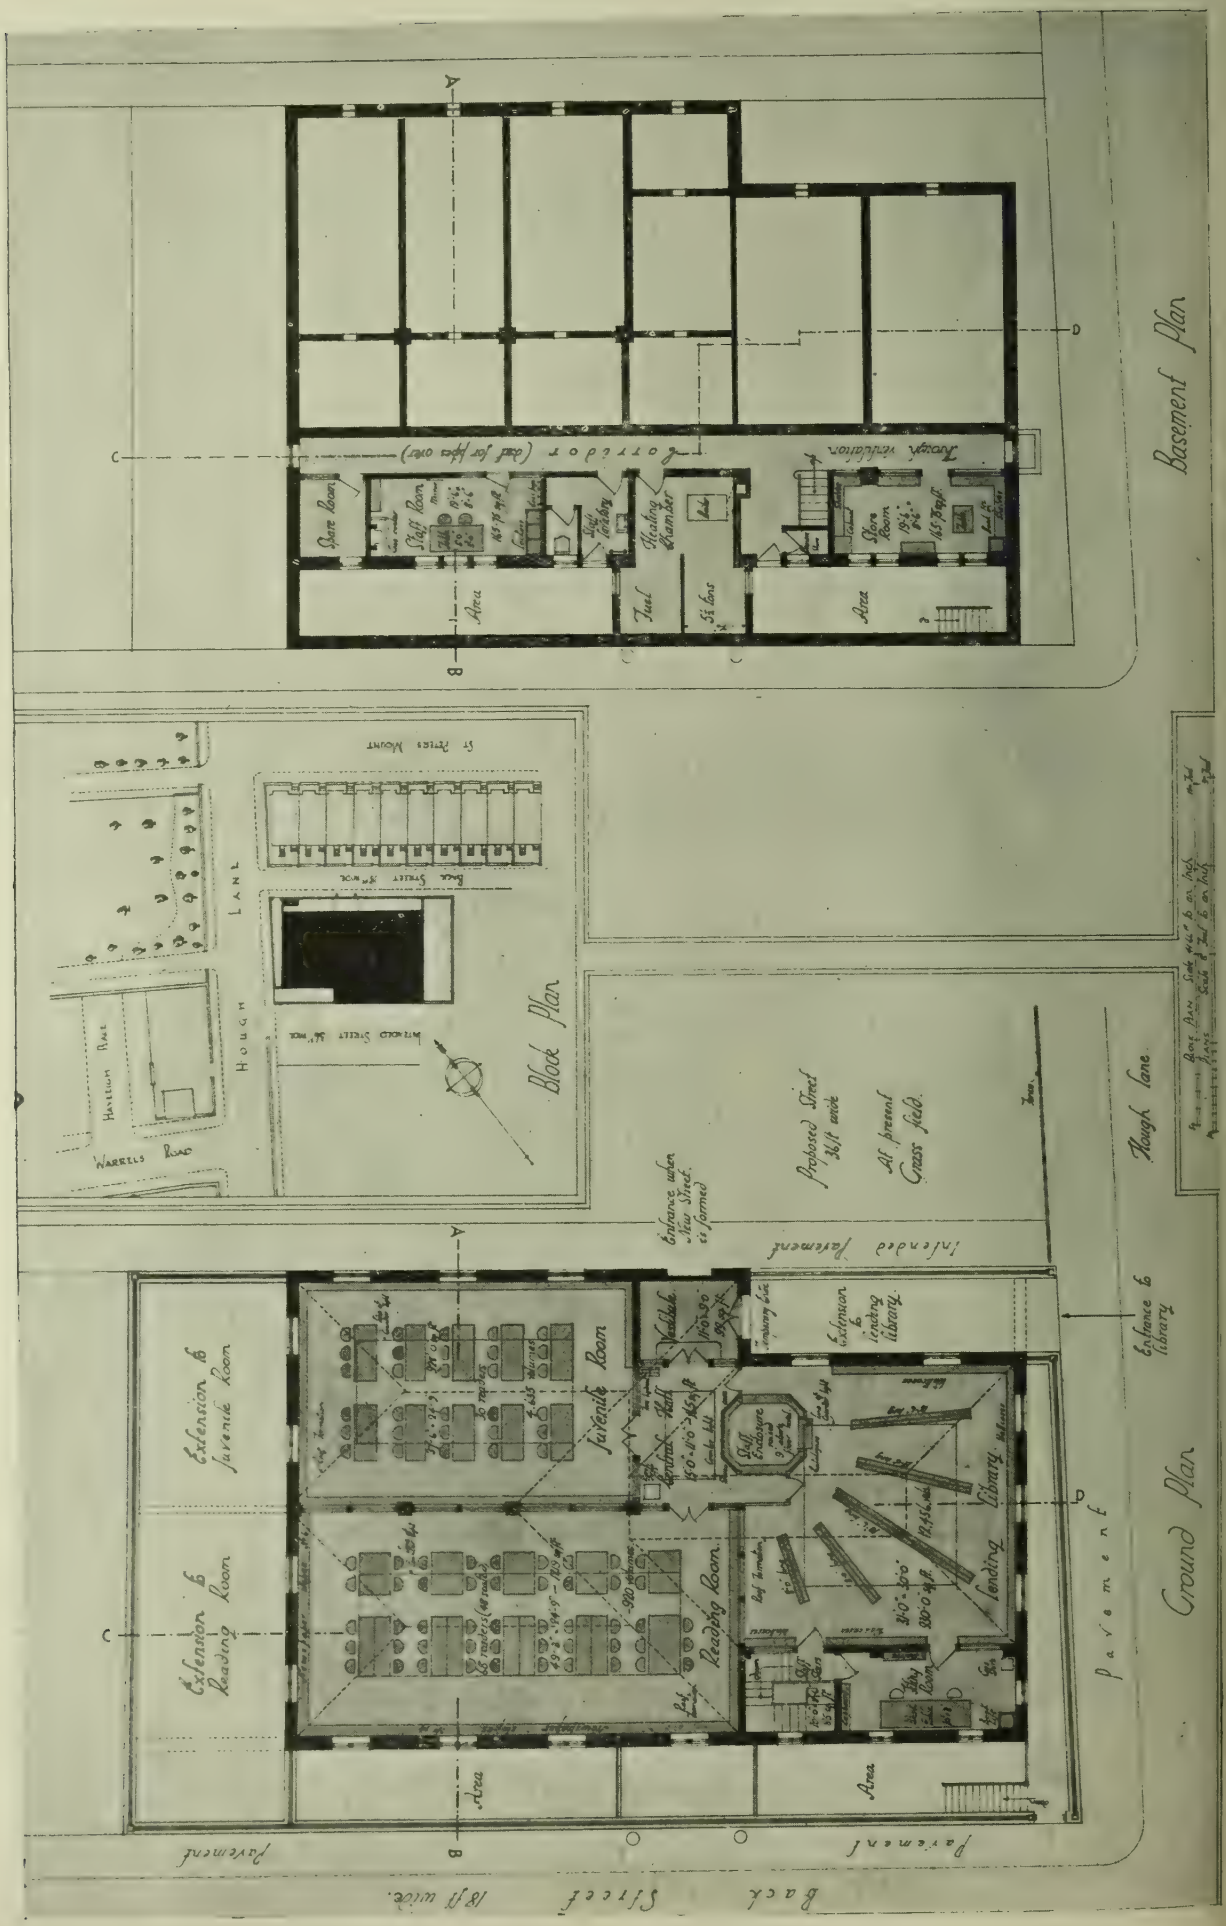
In the interior no attempt was made at a style effect, and line and colour were relied upon entirely. In spite of the smallness of the site the stage itself occupies roughly two-fifths of the space available, together with the dressing rooms more than one-half. There are fifteen dressing-rooms, including a rehearsal room, and there is a suite of offices over the top of the auditorium along Russell-street.

The electrical installation has been carried out by Messrs. Ohms, Ltd., under the direct supervision of Mr. P. Godfrey, who acted as consulting engineer. The electrical intake rooms have been equipped by Messrs. Ernest F. Moy & Co., who are also responsible for the stage switchboard. The stage electrical installation is a combination of the English batten and spotlight system with the Schwabe Hazait system of indirect lighting. The stage hoisting gear, as well as many other items connected with the stage equipment, has been supplied by Messrs. Bullivant & Gimson. Messrs. Merryweather are responsible for the safety curtain.



This theatre is the first building in London with a non-combustible stage roof, as required by the new regulations, and the skylight opens automatically in case of fire. The auditorium is heated by a plenum system, the distribution of the warm air being effected by means of a warm-air chamber extending through the whole space under the floor of the stalls, with outlets under the seats giving not more than 10 ft. per second flow in a space of 100 sq. in. each. Small plenum spaces are arranged under the dress circle and upper circle, and no gratings have been placed in the walls in any single instance. The extract chamber is on the roof, and the extraction of the air is effected in one place only, exactly over the proscenium arch. This has been done in order that, in the event of a fire occurring on the stage, no flames or smoke would invade the upper circle, but would be drawn straight up on the auditorium side of the proscenium arch during the time required for the fire curtain to descend. All other portions of the building, including the stage and the roof of the stage, are heated by means of a low-pressure hot-water system. The general contractors are Messrs. Bovis, Ltd. The principal marble work was executed by Messrs. Ansell & Odling & Sons, and the lead and iron work by Messrs. Henry Hope & Sons, Birmingham. Messrs. Galsworthy, of Newman-street, W., the sanitary installation has been carried out by Messrs. Davis, Bennett & Co. The curtain and draperies were executed by Messrs. J. A. Chapman & Co., of Great Portland-street, W. The seating work is by Messrs. Archibald D. Dawnay & Sons, Ltd.

The sighting line of the seating is the result of a test made from all quarters of the theatre, and a clear unobstructed view of the stage is obtainable, whilst tip-up comfortable seats are provided from stalls to gallery—a truly welcome improvement.



Mr. E. Schaufelberg was the architect.

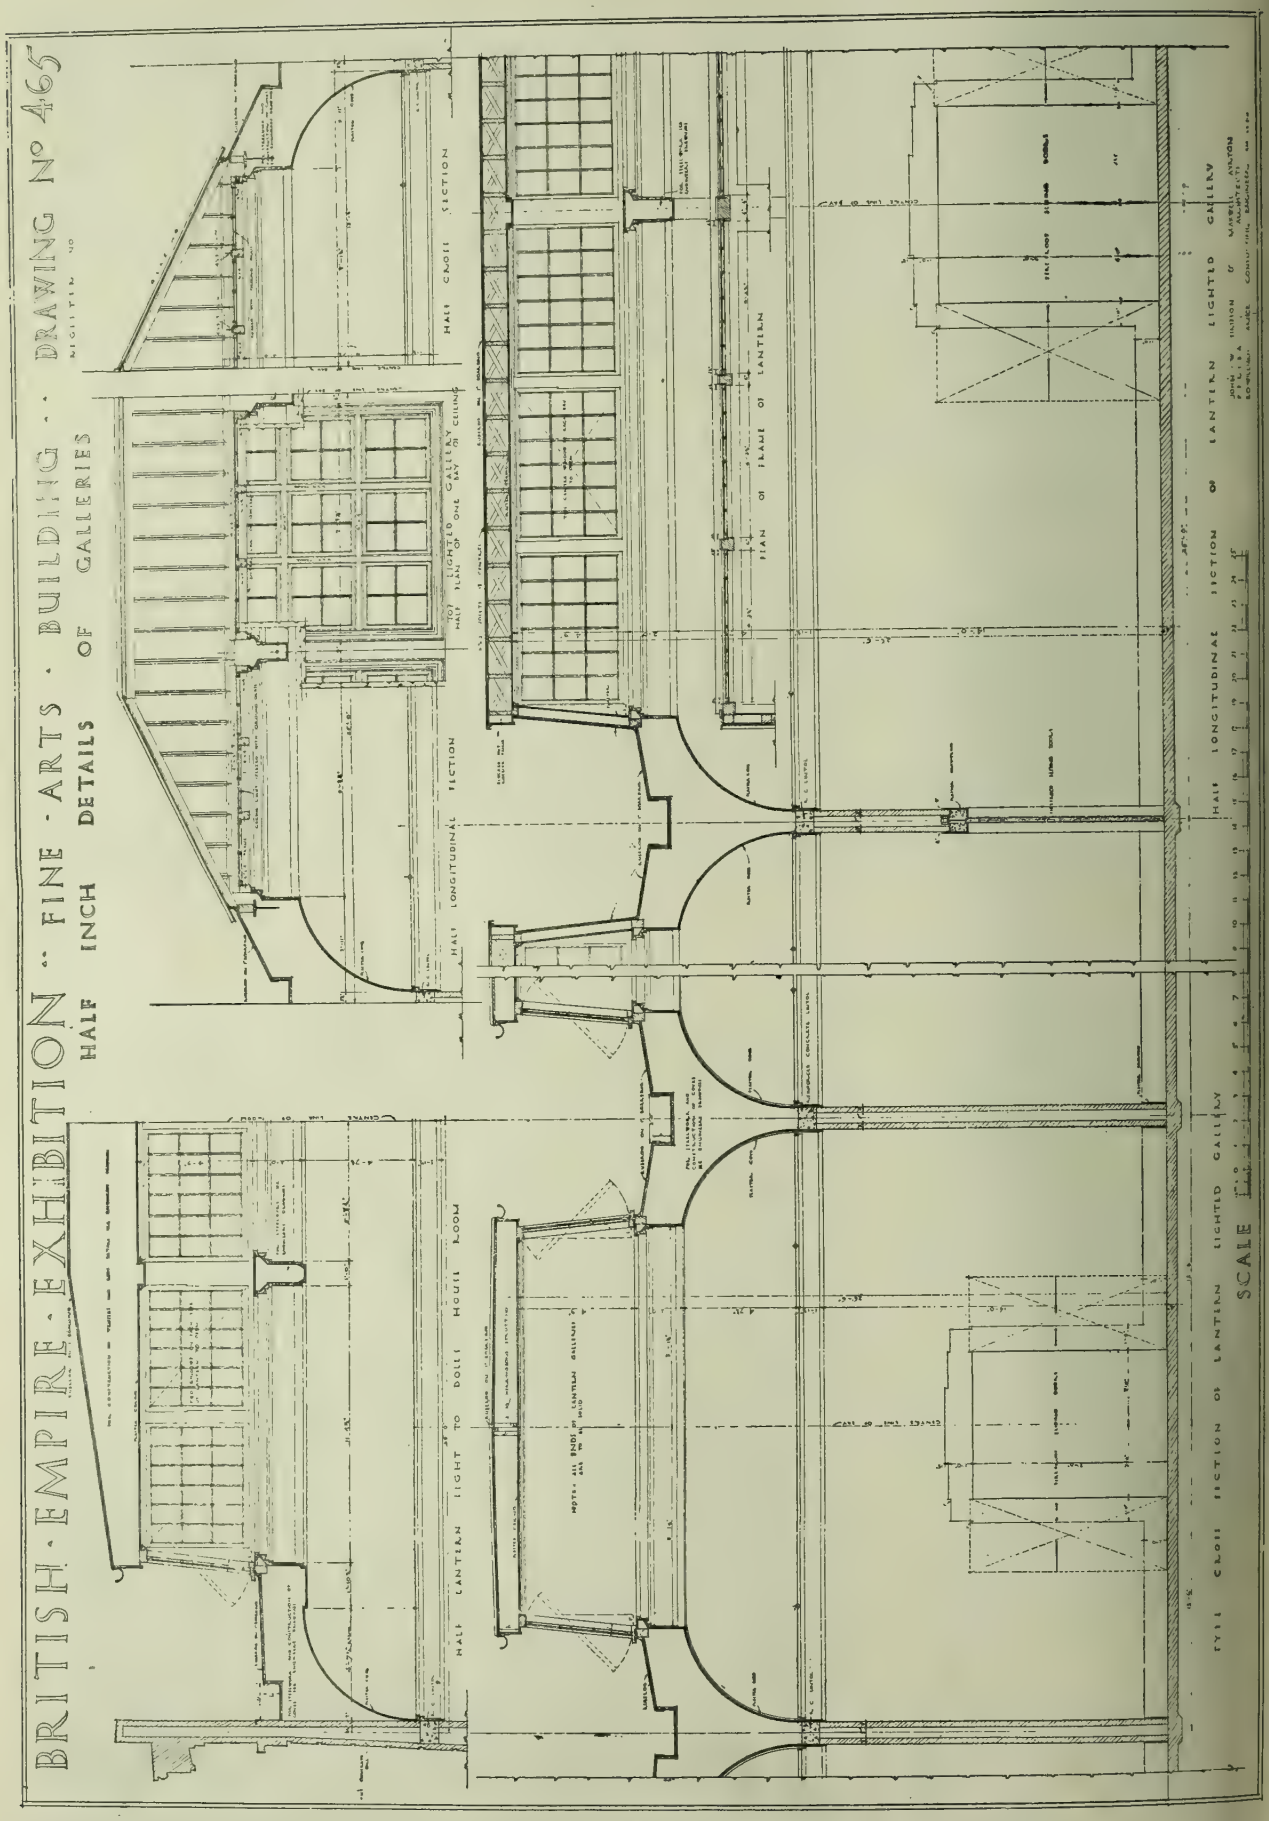
BRITISH EMPIRE EXHIBITION

n April 23, His Majesty, accompanied by Majesty the Queen, inaugurated the open- of the British Empire Exhibition. Imagina- is baffled by the vastness of this exhibition, h is an honour to the enterprising spirit ne British race, and also to the capability ritish architects.

venty millions of pounds have been spent in Wembley's walls, where all the gates he Empire are to be found, from the ntic East to the progressive West, com- ng every part of the vast Commonwealth by the perseverance of an ingenious le. There exists a promise for the future the immense power of the British Empire contribute more and more to every branch ctivity of mankind; that the Empire is lagging behind other nations, but rather aking the lead, by new inventions, by k of spirit, and vigour and energy. This bition is really the Empire in miniature, it is a world-wide event, unique in history of industry and architecture.

aced between the Swedish Exhibition ch has been a revelation in the progress rchitecture) and the forthcoming Inter- nal Exhibition of Decorative Arts in s, 1925, which France is feverishly pre- g, Wembley is bound to attract the e scientific and artistic world's attention. immense amount of work has been ac- blished within a very short space of time, ne praise of the organisers and the chief itects, Sir J. W. Simpson and Mr. well Ayrton. We must understand that xhibition provides always an opportunity display not only of industrial products also of architectural beauties. In every bition there is that provisory part which emolished after the function has ceased, the part which is to remain permanent, e used on other occasions. Thus of the ering souvenirs of the International Paris bition of 1900, two gems of French archi- re remain, *i.e.*, the Pont Alexandre III, the Petit Palais. Wembley will suffer same fate. Parts will be demolished, e portions will show to the future genera- the achievements of contemporary archi- re. The gigantic Stadium reveals the ing conception necessary to meet a sport- need, and the Palace of Industry will be erpetual reminder of our architectural cities.

me of our young architects, burning with spirit of revolution in art, would have rred to see more accent in modernism. let us say, first of all, that a style in tecture is only created after painful and nuous efforts for years and years. Here re in a British Exhibition, and every- from the smallest product to the biggest ing must be British: industry as well as tecture. The architects have judicially oyed the correct amount of modernism e expression of a new material. Rein- l concrete has but little artistic past, we are sure that the representatives r dominions will recognise the Mother- by its architecture as actually ex- ed. What would have happened had it otherwise?



art from the artistic side of an exhibi- there is that most important factor, the cial side, which commands modern life, o a large extent the returns must justify xpense. Hence some forcible restrictions e expenditure with regard to architecture. bley has been chosen as the site for the ition on account of its easy accessibility. hundred and twenty-six stations in al London will be used by the flood of rs who will reach the exhibition in an ge of eighteen minutes. Tubes, trains, and trams converge to Wembley, and l wide motor-roads have been built so traffic congestion will be avoided. Two of land have been converted into a concrete courtyard with eight plat- where, on each, four buses will be simultaneously loaded and 100,000 passengers daily can alight. An inquiry office and inter- preters assist visitors in every way, and arrangements have been made so that during the busiest moments of the day 800 buses will run—each leaving at an interval of fifteen seconds. The general lay-out of the plan, covering a total area of about 220 acres, in spite of the difficulties of the site, is ex- cellent. Its monumental lines are impressive, harmonious and comprehensive, despite its vastness. The main access is from the north, close to the station, with a monumental avenue of about 250 ft. wide, leading to the chief decorative feature, the Stadium. This avenue is the main axis of the plan, bordered by the most important buildings, the Palace of Industry and the Palace of Engineering. The second axis, crossing perpendicularly the first, leads from the Indian Pavilion to New Zealand and is bordered by the Pavilions of Canada and Australia; so the principal features of the exhibition have been grouped, very correctly, round these two main axes. Facing the north entrance and commanding the central alley of the plan, the Lloyds Bank building stands, symbol of the power of capital in every industrial enterprise. Further on and beyond the lake, on the same axis, the *Times* building is to be found, another symbol of the importance of journalism in modern life. At this point we should express our regret that the latter building, being a feature in the centre of the main axis, and the perspective view of which will be enjoyed from the Stadium, on account of the difference of level, has not had its roofing more carefully studied.

The Palaces of Industry and Engineering are a gratifying evidence of the power of the greatest manufacturing country in the world, and it is very logical that the industrial sec- tion of the United Kingdom should occupy the two largest buildings, and in these two halls lies the proof that science and invention, working together, can produce wonders in this old country. No words can express the intense emotion that the constructive audacity of the builder conveys when we see the admirable perspective view of the interior of the Palace of Engineering, with its trusses of 75 ft. methodically and scientifically spaced. Sir Evan Williams is the engineer responsible for the whole of the constructional work. The Hall, by far larger than Trafalgar Square, covers 13 acres, and con- tains the latest engineering developments dealing with raw material, sea, land and motor transport and lighting. It contains a power station built by several firms, and a new and astonishing system of using elec- tricity. The shadows of Watt, Stephenson and Faraday will gloat over the scientific treasures contained in this building.

The Palace of Industry, with its reinforced concrete trusses, shows a very beautiful symbolic frieze painted in yellow and blue. And here we find what the inventive spirit of an architect can do, and how he can treat such an old thing as a column in a new way, with an evident inspiration from the lotus- shaped Egyptian columns. Here we find, too, how colour forms an integral part of architecture, and how the lesson which has been bequeathed to us by the Byzantines in decorating large surfaces of wall-space can be applied successfully to the areas that rein- forced concrete give us. The Palace of Industry gives accommodation to everything which is not included in the Engineering Section, including chemistry, both cotton and wool textiles, food specialities, soap and cigarette manufacturing, etc. The exteriors of these two buildings are expressed in a powerful way where the vertical lines of rein- forced concrete are accentuated by square pillars, carried still higher by flagstaffs which are supported by beautiful and dignified lions' heads. Going farther, always on the main avenue, and towards the Stadium, the visitor crosses a lake, spanned by highly pitched bridges and from which one has the finest view of the whole exhibition, towards the minarets and cupolas of the Indian section, carrying the mind back to far-off Eastern civilisations, and from which the mystic vision is completed by native boat-races on the lake. It is for this reason that the arches of the bridges have been built so high, and we find, on the other hand, that the slightly encumbered main avenue, either by accident of level or of small buildings or kiosks, breaks the monotony of the perspective view, and helps to conceal agreeable surprises which the visitor is always pleased to discover. From the same bridges one enjoys the sight of a noticeable kiosk which has a peculiar covering of curved glass. The two central bridges lead to the Stadium, while the others, on the left and right respectively, lead to the Canadian and Australian Pavilions. The former abounds in rich details, while the latter (of which Mr. Oakshott is the archi- tect) is remarkable for its large bays

e time of the Curiaces. Restaurants and
a-rooms are provided, the latter with a
odern decoration of gold, red and black.
he planning and organisation of the Stadium,
hich is a very difficult architectural problem,
d which needs a special description, has been
ccessfully thought out. The two strong
wers, terrace and reinforced concrete arches
ve to the elevation its peculiar expression.
To the left of the second main axis of the
an comes India (Mr. White Allens, archi-
ct). In a series of courts India is exhibit-
g the bewildering resources of ten large and
enty smaller provinces and states, each
ving a special section. With its white
alls, its minarets and domes, and the interior
untains and pool, this pavilion is invested
th a subtle oriental mysticism and suddenly
ansfers the visitor from the activity of the
estern pavilions to the agreeable exotic rest-
lness of Eastern life.
It has often been stated that this building
modelled on the Taj Mahal, designed by
a-Mohamnad, and many newspapers have
llen into this error. A rectification is neces-
ry, as the general lines of the building belong
the sixteenth-century Mogul architecture.
he main entrance is closely related to the
osque of Futtipore-Sikri. (Mussulman
dian architecture is characterised by two
stinct periods, the one preceding the Mogul
a and where the influence of the Jaina style
edominates, and the one which follows,
hich is of Persian influence, and which
ained its most flourishing period under
mperor Akbar.)
Close to India, Burma lies. Here are the
arters where the East is in full swing.
st Africa, Nigeria, the Gold Coast, Ber-
uda, Palestine, Cyprus and Malta are
uped together, and their neighbours across
bridges over the railway track are Ceylon,
ng-Kong and the West Indies. Burma is

British Empire Exhibition: Ceylon Pavilion.

by far the most artistic section. Here we find art for art's sake, and many a lesson could be learnt by studying the Burmese artistic traditions, the origin of which is lost in the mists of antiquity. The exquisite native temples, with their graceful spires, from which little bells tinkle at every breath of wind, evoke the melancholy and serene atmosphere of a far-distant Buddhist retreat. This corner is one of the most picturesque sections of the exhibition, with its souvenirs of Mandalay and the Arakan Pagoda; and what beauty is to be found in that wonderful and gorgeous shrine of carved teak! The high golden votive pillar within the Burmese enclosure and its banner of gold and white, and the two prayer-calling bells, enhance the architectural effect and complete the vision.

Close by, West Africa, with a walled city of more than three acres, wherein are found the pavilions of Nigeria, Gold Coast and Sierra Leone, displays a mud village throbbing with native life. The plain walls, without mouldings, and of most successful colouring, are pierced here and there, showing that the interest is to be found within the walls, where covered ways and picturesque huts will carry the visitor back to life amidst primitive tribes.

The East African Pavilion offers an example of exotic architecture with white walls and green painted woodwork. The contrast of voids and solids is most pleasant and the proportions very successful. Round a square courtyard busy Oriental bazaars display their attractive wares. Nothing has been omitted. Kenya, Uganda, Zanzibar, Nyassaland, the Sudan, with the Dam of Assouan, are all present.

Across the South Bridge we reach Ceylon, with its wide open portico flanked at both extremities by circular towers, the pointed roofs of which are supported by small columns. The horizontal lines are predominant in this building and curiously worked out. A close neighbour is Hong-Kong, with its green roof and picturesque inscriptions, banners, and streets thronged with busy Chinese shops and shoppers in their native dress, contrasting vividly with the red and black painted bamboo trusses.

Facing the gardens which precede the Ceylon Pavilion, West Indies and British Guiana lie, with their Colonial architecture, and comprise Jamaica, Trinidad, Barbados, the Bahamas and Falkland Islands.

The British Government Pavilion, guarded by huge lions, is approached by an old gate and is situated on the longitudinal axis of the Canada Pavilion. It would be difficult to describe the charm of the mediæval archway with its harmoniously shaded bluish slates and pointed towers surmounted by dovecots. The shops, preceded by two long colonnades, in reinforced concrete columns, are bound to interest visitors on their way to the British Government Pavilion. Expressive, significant and impressive, representing the power and strength of the whole Empire, the architecture is in keeping with the Palaces of Engineering and Industry. It includes a court of honour surrounded by galleries and a panorama, while four staircases lead to the upper floor. Newfoundland lies close by, and with its delicate architecture evokes the charm of the seventeenth-century French style.

The Union of South Africa has its pavilion next to the Stadium and near the railway track. Everything which contributes to its wealth, the fertility of the soil, as well as its industrial capacity, is suggested in a pavilion built in the old Dutch fashion, with a huge red-tiled roof, the entrance feature reproducing, on a larger scale, Groot Constantia. A powerful effigy of Van Riebeck, the first Dutch colonist, surmounts the central motif. Here artists are enabled to see the famous blue clay of Kimberley, and a beautiful display of gold quartz from the Reef. Here, too, one may peep at the Veldt, teeming with its animal population, and a Zulu village, complete with a royal kraal in the centre. The organisation of an ostrich farm, with a paddock and pens for sheep and goats, will attract architects interested in country architecture.

The decoration of luxurious sleeping railway-cars and dining saloons is another interesting feature. Malaya lies on the longitudinal axis of Australia, showing graceful yellow-striped minarets and an elegant dome. An open courtyard leads to the entrance, and here we have

British Empire Exhibition: Bridge across the Great Lake.

a vividly coloured specimen of adapted Musulman architecture

New Zealand, facing India beyond the ornamental lake, is a British adaptation of Italian Renaissance. Remarkable carved panels crown the colonnades of the two wings, and the interior is certainly very fine. Original carved frames round the doors and friezes running along the walls contribute to the general effect. An Art Gallery where the latest theory on top-side lighting has been applied should prove of great interest to architects and others. Maori and Samoan huts accompany this building, where agriculture and marine exhibits show the activities of the overseas Dominion.

The Palace of Arts, behind the Palace of Industry, and close to the Conference Hall, shows another method of lighting art galleries. This, too, will be of interest to architects. The walls are covered with a dark, bluish-grey canvas, which absorbs all light and thus avoids reflection. The entrance hall has a fine red-and-black decolite floor. A beautiful basilica, where blue tones predominate, is a most attractive feature attached to the Palace of Arts, and lovers of artistic lettering will find therein splendid examples—executed by members of the Society of Scribes, one of whom, Miss Spooler, shows a beautifully transcribed "Ten Commandmants" on a goatskin. There is a stone inscription by Mr. Laurence Christie, and Mr. Johnston exhibits some of his work. Enthusiasts of English architecture will certainly admire a delightful nineteenth-century-period room by Professor A. E. Richardson.

The conference and concert hall has been built with all the scientific requirements that acoustics demand. Mr. Sutherland, of University College, has been the specialist consulted on the matter, and here again architects will be interested in the way sounds from the stage are reflected upon the auditorium.

The amusement park is an important section of the Exhibition, and occupies fifty acres. All modern thrills and delights are provided, including jazzing motor-cars, a giant switchback, and the biggest scenic railway ever constructed. Minute precautions have been taken for the safety of the public, and the construction of this park is a technical puzzle.

The largest bandstand ever erected, with a seating accommodation for 10,000 people, and carefully designed so as to throw the sound in every direction, has a square check-pattern modern decoration. Near the bandstand huge restaurants will cater for the public. An immense modern painted frieze, by Mr. Oliver Bernard, is the main exterior embellishment.

Every architect has not the good fortune to attach his name to such a work as Wembley, but every architect surely will find a source of profit from the profusion of subjects treated. Wembley, itself a small world, stands before the world as an example of the courage and progress of the race.

British Empire Exhibition: South Africa Pavilion.

COLOUR IN ARCHITECTURE.

In a recent lecture at the Central School of Arts and Crafts, Sir Banister Fletcher discussed the further development of architectural style which was consequent on the removal of the capital of the Roman Empire by Constantine in A.D. 324, from Rome to the old Greek colony Byzantium, which he re-named Constantinople, and to which the Turks gave the name of "New Rome." This daring change was made largely from commercial considerations, and it indicated not only the progressive commerce of those days but also the foresight and enterprise of the first Christian Emperor, which secured for him the title of "Constantine the Great."

Constantine had established Christianity as the State religion in A.D. 323, and it was only in accordance with human nature that differences and disputes should arise, and Constantinople was ready to take the lead of one division of the Church when, later, it was divided. A basilican church was there erected by Constantine, and this site was afterwards selected by the great building Emperor, Justinian, for his great church of the "Hagia Sophia," or Divine Wisdom. Roman tradition, Greek talent, and Oriental surroundings combined to develop a curiously clever compound of architectural character, which was now known as Byzantine. It was a compromise between the Roman science of construction and the accepted Eastern methods of domical building. Certain aspects of Eastern Christianity also contributed modifications to the plan, for in the East there was only one altar, in great contrast to the many altars of the Roman church. This sanctuary was jealously cut off from the rest of the church by a huge iconostasis or painted screen. Here again the East differed from the West; in the former which dreaded idolatry, no carved figure was permitted, and so it came about that coloured marbles and glowing mosaics were used to sheath the walls both within and without. This one and only altar, and a use of a central dome, together made a great central space more natural than long-drawn nave and aisles of basilican type. The great new feature was the use of a circular dome brought by means of pendentives in the angles to a square plan, and it was this dome which made the main tendency of Byzantine architecture vertical in effect.

Housing Progress in Scotland.

The following figures show the progress that has been made in State-aided housing schemes in Scotland to March 31, 1924:—

	Completed.	Under Construction
1919 Act	23,929	2,962
Private Subsidy Schemes	2,324	—
Slum Clearance Schemes	412	1,199
1923 Act.....	57	2,280
	26,722	6,441

Of the total number of houses completed and under construction under the 1923 Act, 832 are by the local authorities and 1,505 by private enterprise.

HISWICK RIVERSIDE PROMENADE

HE accompanying plan and bird's-eye view us by the Surveyor to the Council for wick, Mr. Edward Willis, were a few since issued for the information of the s and for publication. As nearly as can scertained from these draughts the work esented as being "already in hand" is laid on the lines designed by Mr. A. B. tt, who was awarded the first premium he banned competition held last year n all members of the Royal Institute ritish Architects were precluded from sub- ing designs. The result certainly justified unified action of the Institute and as this ue, seems identical with the winning which will be found illustrated in *The ler* for November 2 last, we can only to our critical objections on that occasion. impartial remarks then made are still y warranted and cannot be wisely ignored. omparing the outline plan herewith repro- l with the original drawings, and also our wer's remarks in regard thereto, on page of our last volume, the reader will be en- l to follow precisely the points still open question. The only essential difference een the present proposal and Mr. tt's design is that now a high level road, ing seemingly from nowhere in particular, tangent off Burlington Lane wide of Chis- Station, at Grove Park, here crosses the hore over the gardens and promenade ding on to a high projected bridge span- the Thames. This incongruity will com- ly cut off the view up stream westwards, lso shut out of sight the Oxford and Cam- e Boat Race from the crowds assembled e promenade situate to the east or right- of this obstruction. The Barnes railway e at the other extremity is unavoidable, hy a similar obstacle should be thus incon- ately introduced to spoil the unique ex- e of this uninterrupted river walk is inex- ble, seeing that the road and bridge might well have been located a little farther to ast on the confines of the sewage works nd the length of this promenade, which w to be made lobsided with horrid ws and interference with sunshine, so tial for both flowers and visitors, to say ng of the sightseers every Lent. Another e appears more or less apparent judging the bird's-eye sketch, which shows a wide ped foreshore pitchered with rubble and ed by a flight of steps in front of the band- , as proposed by Mr. Elliott. On the before us this battered frontage assumes more the dimensions of a somewhat ally inclined wall, but the steps are left A good solid wall we reckon essential e a durable foundation on the sand or mud fit for a solid stadium's construction led to hold vast moving crowds, and for keep of the pleasure-grounds, too, besides g to hold back the tidal waters and tides' pressure. The tennis grounds at ar are still to be provided and the band- of course, but behind that, and rather as g apart, there has been introduced a big ned structure, possibly an assembly or

Chiswick Meadow Lay-out.

club house, perhaps a sort of casino, which was cut out from the competition in the revised conditions. Whatever it may be the edifice is set down in the bird's-eye picture regardless of the main perspective set out of the whole thing, by delimitating it to a different scale and entirely different manner, making a most unworkmanlike performance. The Boat Race crowd still appears to be left free to obtain unhindered the full run of the entire premises regardless of annual damage to the parklike environments of the scheme, which will be trampled down by a stadium throng of excited outsiders, the greater part arriving by trains and cars to the discomfort of residents and ratepayers.

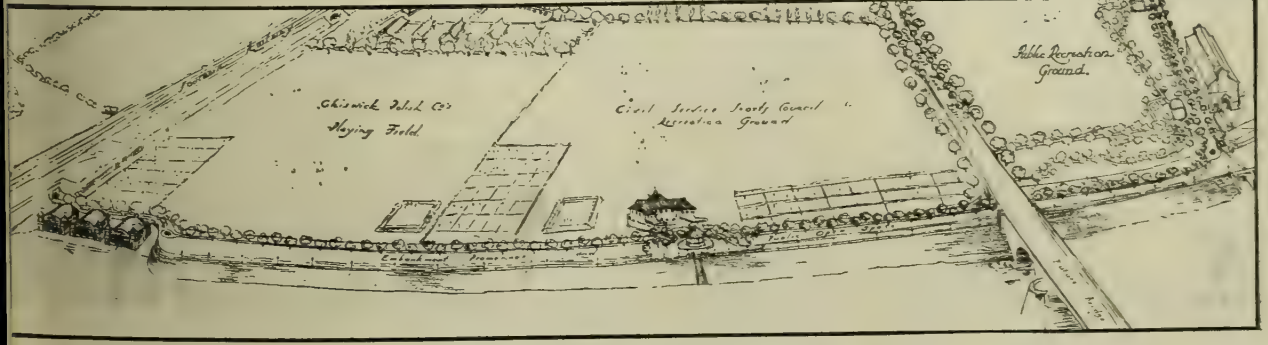
THE STRAND AND THE ADELPHI

MR. J. SLATER lectured recently before the London Society on this subject. Sir Aston Webb presided.

In the course of his remarks Mr. Slater said that the topographical history of the city of London could only be dealt with piecemeal. London was an agglomeration of many individual units, and the more they studied those units, each with its own separate idiosyncrasies, and traced their growth and development and final absorption in the huge London that they now knew, the deeper and wider became their interest.

The Strand was originally, as its name implied, simply the river bank, from which the foreshore sloped down to the lapping waters of the Thames. In those days the river was the great highway, and the road, so badly was it kept up, was nothing but a by-way. In 1353 the roadway was well nigh impassable, so deep and muddy was it, and it was not till the end of the fourteenth century that there were any dwelling-houses there. The first mention of any building of importance occurred in the reign of Henry III, when the Hospital or Chapel of St. Mary Rouncivale was founded. In the same king's reign Peter of Savoy received a grant of a considerable portion of land on the Thames in the way called the Strand, and here the first Savoy Palace was built.

The original area on the south side of the Strand was occupied by the Inns, as they were called, of the various bishops: Exeter, Chester, Llandaff, Lichfield, Durham and others had their palaces there. In Arundel House the Earl of Arundel collected a number of works of art from Greece and Rome, but those statues soon ceased to be properly cared for and became miserably neglected. Three of the lanes still leading out of the Strand were of great antiquity—Milford-lane, Strand-lane, with its old Roman Bath, and Ivy Bridge-lane.



Somerset House was one of the principal mansions built there, the original Palace dating from 1549. Durham House had many interesting associations with it. Sir Walter Raleigh occupied the mansion for about 20 years York House was built on the site of the present Charing Cross Station, and was occupied by George Villiers, Duke of Buckingham; in 1672 the Duke sold the whole site to some speculators who developed it, and commemorated in the streets they laid out the names and titles of the Duke with an amazing thoroughness. They found George-street, Villiers-street, Duke-street, Buckingham-street and Of-alley.

The house of the Society of Arts, in which they were now assembled, was built by the brothers Adam for the Society in 1772 The brothers Adam left their mark, not only in the Adelphi, with which their names will always be associated, but in many other parts of London. There still existed, spanning what is now Durham House-street, a charming little bridge connecting the two buildings on each side which used to belong to Coutts, the banker.

Mr. Slater concluded by expressing the hope that the London Society, which was doing yeoman service for them in rousing the public interest in the City, in preserving what was old, but not worn out, would succeed in ensuring the New London should be worthy the dignified traditions of the Old London, and merit the words of eulogy addressed to the London of the past by William Dunbar, the Scottish rhymer, who wrote four hundred years ago:—

"O toune of tounes, patone without compare,
London, thou art the floure of cities all."

At the conclusion a vote of thanks was passed to the lecturer.

Chiswick Riverside Promenade.

TOWN-PLANNING INSTITUTE

Mr. W. T. Lancashire (City Surveyor, Leeds) presided over the last meeting of the Town-Planning Institute, held at 92, Victoria-street, S.W., when Mr. F. M. Elgood gave the second portion of his paper on "Buildings and Building Lines, including Zoning" (as defined in the Model Town-Planning Clauses issued by the Ministry of Health), and was followed by Mr. Parker Morris (Town Clerk of Macclesfield) with a paper on the same subject.

Mr. Elgood, on the subject of height of buildings, said he was not sure that in most schemes a great deal more consideration might not usefully be given to height zoning, not alone for the purpose of ensuring sanitary convenience, and a sufficiency of light and air, but for architectural and natural effects; it should be possible to make stipulations in specific and limited instances which would not outstep the bounds of reasonableness and would not, therefore, provoke claims for compensation. The provisions of Model Clause 31, dealing with the space within the curtilage of buildings which might be covered by buildings, gave ample scope for reasonable treatment of various cases. Easier conditions were allowed in the case of buildings existing before the scheme was initiated, when alterations were made in their extent; but this might operate hardly in some cases and unequally in many. Take, for instance, an industrial building having a curtilage area of 900 sq. yds. with a building area of 700 sq. yds., and a height of over 30 ft.; although the building already exceeded the two-thirds proportion allowed for new industrial buildings, yet under the Clause it would be permitted to extend its area by 20 per cent., making it 840 sq. yds. out of a total curtilage area of 900 sq. yds., which was a proportion of more than eight-ninths. Granted that some latitude ought in fairness to be given to existing buildings, without some limit of proportion, and, if the cases were at all numerous, it might nullify the advantages of the Clause in some areas. Besides, it would form a bad precedent to a Council who might be asked to exercise their powers under the proviso (a) of the clause, in the case of an industrial building side by side with the last, having a similar curtilage area of 900 sq. yds., but a building area already covered of only 500 sq. yds. Here without the consent of the Council the building area could only be increased to 600 sq. yds. It seemed to him it would be fairer and better to omit the second paragraph of the Clause altogether, relying upon a Council's discretion under the proviso specified. Was there, possibly, some subtle distinction between the words "a building whose erection is commenced before" and "a building erected before"? Only seven lines separated these two phrases, and one was left wondering. It was significant that in the four cases in which a Council could at their discretion vary the ordinary proportion between curtilage and building area, in none was there any appeal against its decisions.

Building lines were dealt with in the Model Clauses in three divisions, viz.: (1) building lines for streets shown on the Map; (2) building lines for new streets not shown on the Map; and (3) building lines for existing streets where the line was not shown on the Map. It was assumed that normally building lines should be shown and figured on all streets shown on the Map. Whether division (3) above was to provide for accidental omission, or whether it might be thought that owing to varying conditions in the same street it was not practicable to determine the line when the scheme was made, it seemed likely that in not doing so a Council was only postponing, if not actually increasing its difficulty. The question of a possible claim for compensation, if the line were fixed and shown on the Map, might be a consideration in deciding this point, as a Council might be less willing to incur the risk to begin with than when building actually took place and the occasion arose to fix the line. If the determining of the building line was postponed until plans for a building were submitted, notices would have to be given to all owners of land concerned, and attention was drawn thereby more prominently, not only to the effect of the building line, but to the rights which were specifically given under Model Clause 57 to owners then to claim compensation. On this question of compensation for injury due to the fixing of building lines, there was no advantage in dwelling in the clouds. Although it was originally believed that the subject fell within the exceptions mentioned in Section 59 (2) of the Act of 1909, and that provided the Ministry certified the building lines as being reasonable no case for compensation could arise, this appeared now not to be so, as it was not covered by the words "which prescribe the space about buildings." Apart from the importance of securing ample space between buildings on opposite sides of streets for the purpose of admitting freely light and air, there were at least two other vital factors to be considered, viz., provision for future road-widening and æsthetic effect. In all cases, too, the subject deserved serious thought in connection with height zoning.

Mr. Morris said he was glad that great stress had been laid on the importance of density and character zoning, for what other aspect of town planning affected the individual to the same extent? The Model Clauses relating to zoning had certainly been drafted with some aim at simplicity, but he was inclined to think they would have been more intelligible had they followed the natural sequence of events and did not put the cart so frequently before the horse. Clause 20, which contained the procedure for determining the extent of land units, to his mind tended to make complicated what could be stated quite simply. The phraseology of the clause was not too fortunate and there was no necessity for using the long-winded phrase, "any road dedicated to the public." Why not use the term "highway"? Mr. Elgood had pointed out that whilst there was a definite provision prohibiting the erection of dwelling-houses and residential buildings on land not included in the land unit there was no similar provision affecting the erection of any other types of building. Unless the Clause was extended to include all buildings it was possible that a non-residential building, the plan of which had been approved under the by-laws, might be commenced without the land unit being defined and when the land unit was defined it might conceivably be found that the building might represent more building units than were allowed by the scheme to be on the land unit. Furthermore, if the building happened to be erected for the purposes of a railway, canal, &c., no building plan would be submitted and no land unit could ever be presented under Clause 20 as it was now drawn. Were such buildings intended to be above the law? The draftsmen of the Model Clause Table had failed to appreciate that a scheme must be easily intelligible to the man in the street. To say whether any particular building could be erected in an area he would have to convert the negative form of the Model Clause Table into a positive form. The table of Mr. Elgood was much bolder than that of the Model. It showed a special residential zone which could never be defiled by any industrial buildings, and again it showed a special industrial zone in which dwelling-houses and most public buildings were prohibited. There might be some danger in excessive rigidity, but there was very serious danger in leaving too much discretion with a local authority, as unless the technical official had a strong hold of his committee he foresaw many buildings being erected in a residential area which should not be there. Touching on the clauses dealing with appeals Mr. Morris favoured appeals going to the magistrates with a further appeal to Quarter Sessions. Professor Abercrombie and Professor Adshead had expressed disapproval of supplementary zoning by any easy method on the ground that important amendments might be made in a scheme without them being thoroughly considered. That amendments were very easily suggested w evidenced by the fact that in the last two months two amendments had been suggest in the Chesterfield scheme, which covered onl small area. He suggested it was better rely in the case of small amendments on power of the Ministry of Health to dispe with some of the Procedure Regulations t adopt the system of Supplementary Zon Orders. In the case of the Chesterfield Or no claims were made for injurious affect caused by the building line clauses. Accord to the decision in the case of Ellis *v.* Ruis Northwood Urban District Council a provis in a scheme which prescribed a building l by reference, for example, to a line on the m might, if it injuriously affected the value o man's property, give rise to a claim for co pensation. But, if he interpreted the decis correctly, a provision in the common form o building by-law dealing with the sufficiency the space about buildings which stated that building should be erected nearer to the cen or side of a street than a certain distance wo not give rise to a claim for compensation, pr ded the Minister considered such a provis to be reasonable.

Mr. Raymond Unwin, as connected with Ministry of Health, thanked Mr. Elgood Mr. Morris for their fair and construc criticism of the Model Clauses, and said t suggestions would receive consideration f those able to deal with them from the l point of view. With regard to the critici made at the previous meeting, it was not intention of those who framed the clause tie up the development of a city with dead land. What they were really trying t was to give the living expert a chance f time to time of putting finishing touches to work he had begun. He himself was q convinced of the necessity of completin stages. In the case of the Ruislip scheme planning was complete before town plan was carried through, and it was possibl allocate in detail with safety. That, how could not be done in the case of many of large schemes before them to-day. To pr a town the scheme had to be cast wide, they must complete the details as they along. He would press that as regarded sch they should take a middle line, and confidence in the local authorities. P should not be given to the expert at the he made the first plan to tie the thing up leave no one the power to untie it excep means of a new scheme; but they should to the local authority having regular e advice so that supplementary work would be carried out except on good and well tho out lines.

Mr. T. Alwyn Lloyd pointed out the nece for zoning in regard to the height of resid buildings. Nowadays they saw a tremen development in bungalow building, and whole character of areas was changing for reason, and in cases where there were no s regulations the most unfortunate results tecturally were being obtained. He a with Mr. Raymond Unwin as to the nec of completing sections of their developm stages.

The discussion was continued by Mr. Rimmer, Mr. L. M. Jopling, Mr. G. L. P and Mr. F. L. Thomson.

The Chairman expressed approval gen of the Clause, and said that whilst they all glad that so few alterations had been necessary in the Ruislip scheme, yet i obvious that large industrial cities like required totally different treatment. Mr cashire gave the figures of Leeds, whic tained 33,000 back-to-back houses of forbidden as far back as 1876. Industri town like Leeds changed constantly, and clothing factories used to be lofty bu the more recent buildings erected wer floor only. On the housing sites of Leed encouraged factories for light industries. were clean, and there was no object trains. The time of the people was and congestion in the centre of the relieved.

THE ARCHITECTS' AND SURVEYORS' ASSISTANTS' PROFESSIONAL UNION

HE third of a series of four lectures arranged ler the auspices of the Architects' and Sur- ors' Assistants' Professional Union was held he Building Exhibition, Olympia, on April 23. n address was given by Mr. H. V. Lanchester, .I.B.A., Past President of the Town-Plan- Institute, on "Traffic and the Roads." he course of his remarks he said considering r English roads, whether from the point of v of the motorist or others using them, it le for clearness to begin with the briefest ible summary of their history.

he earliest tracks they could trace were those he Neolithic period, when the tribes at that e occupying the land determined the best es by which to move their flocks from one ure to another. The lower grounds seemed ave been densely wooded and the habitation redatory beasts, so that they found those ls taking the shortest lines across valleys following escarpments and hill tops. Where natural formation failed to make the line ious guidance appeared to have been rded by natural or artificial landmarks. se routes were retained for trade and war, served the early agricultural developments re the advent of the Romans. They were, hey knew, distributed in accordance with the of the land at that time, leaving large dis- ts untouched as inappropriate to the activi- of that stage of civilisation. When the nans took up the great work of organising country in accordance with their political em, they planned an entirely new system of ed roads, primarily for the movement of ps, but at the same time so complete as to be e than adequate to other requirements. As were aware, those roads were fairly direct their general alignment, and with a few ptions absolutely straight from camp to p, and placed a day's march (about 20 miles) rt. A map indicating all the known roads red the country well served with routes most ully planned except from one point of view, of much more importance than then, namely, of gradient, which was obviously a minor ideration with so little wheeled traffic. le many of those roads had remained anently employed, large sections of the an scheme had gone out of use, and could raced only by fragments to be found here there. This abandonment was not con- ed with any unsuitability in the roads, but as due to the dismemberment of Britain r the Saxons and its only partial re- gration under the Feudal system. Not until r times did they recover anything resem- the unity of control exercised by the Ro- s, and even then nothing equivalent to their ency in sustained organisation. Of course increasing population and production the try became covered with a network of es, but many of those were only pack horse , and the art of road-making having lapsed routes were often in a hopeless state where al conditions were unfavourable.

the early days of wheeled traffic this became finitely the case that very circuitous routes to be taken in bad weather, sometimes in- ng detours more than doubling the distance een one town and another. Stone sets were employed in the cities and no other effi- mode of road-making being known, roads d ground soon got so cut up as to become ssable. Where the ground was open les struck out new tracks until the old had ered, and they found at places very wide sometimes subsequently narrowed by es. A number of experiments in road ing carried on for about a century finally allised in the definite specification of dam, and a reliable surface capable of ing the increasing wheeled traffic came into al use. With easier and more comfortable it, travel increased rapidly, and immense er of coaches and post chaises sped along their main roads. New roads and improvements in alignment were found necessary, and towards the end of the eighteenth century an era of road building set in which lasted till the advent of the railway.

Macadam, Telford and other leading engineers were engaged on the work, and the return for the capital was provided by means of tolls. The primitive type of gate, the turnpike, gave the name to them, and the period during which those roads were built had been termed the turnpike age. In the midst of this activity the railroad and steam engine came on the scene and after a few years of incredulity everyone became convinced that the day of the road was over. Roads ceased to be a profitable investment for capital, which was promptly transferred to rail enterprises. Not only this, but on the railroads securing popular favour railway schemes were often laid out in a manner detrimental to future road development, particularly in the neighbourhood of the towns. Outside the towns things remained in this position until towards the end of the nineteenth century, when the development of the combustion engine as the driving power for road vehicles brought the road into enormously increased use, and demanded a reconsideration of the problems of road planning and construction. The first problem to arise, that of dust, was not a new one. In coaching days the Bath-road was kept watered from end to end, but a better solution was now found, and without recapitulating the recent history of road-making, it would suffice to affirm that they could now form roads physically and economically suitable for motor traffic.

In regard to town roads, the eighteenth century provided them with good schemes and spacious roads, and much of their subsequent deterioration, including encroachments, took place in early Victorian times when the railway filled the public eye. The road plan of London south of the Thames dated from that period, and Great Dover-street was a good example of a by-pass road. Edinburgh and Bath might also be quoted as notable examples, but many of their smaller towns retained their mediæval plans, and not even then at their original standard, market places having been filled in with buildings and the roads having suffered from gradual encroachments particularly near the busy centres.

Their future roads were now being dealt with by two methods. Road systems were being framed under town planning, or more comprehensively, under regional-planning schemes, while large arterial roads were being planned and constructed to connect towns at a considerable distance from each other.

In the first case a careful study had to be made of the existing roads, their use, their adequacy and their connections. The trend of development had also to receive consideration and the new road pattern built up on those factors, providing for the relief of overcharged routes, safety at junction points and a free movement of traffic between industrial and residential areas, so that the business of the district might be carried on without the handicap of inadequate communications.

In the second case the determining factor was mainly the economics of transport, whether a road service could operate advantageously as against the existing railway facilities. Per ton mile the road was at a disadvantage but this might be outbalanced by economics in transhipment and terminal collection and delivery. For the shorter distances and for some classes of goods the case for the roads might be regarded as established, but for 100 miles and over it was possible that further investigations were needed before such roads could be justified on economic grounds. Undoubtedly a good case could be made out at the moment, but the railways were short of plant, and it was also questionable if they were working at a maximum of efficiency and a maximum of profit, as they might be capable of doing in competition with an alternative means of transport.

In regard to traffic congestion in their great cities, motor transport had at least doubled the capacity of their streets, and, if all the traffic could be carried on at the uniform higher speed of the motor, there would be a still further gain. The abolition of the horse-drawn vehicle had been frequently advocated, and though this must take place sooner or later, it was still felt that too great a hardship to certain classes of business would result from it. An intermediate course was open, namely, the exclusion of the horse from the main roads, but this would involve a degree of supervision that rendered it economically doubtful. It might be assumed that for the moment neither of those alternatives was likely to meet with acceptance.

At the conclusion of the lecture a vote of thanks was proposed by Mr. G. Marlow and Mr. John Mitchell, General Secretary of the Architects and Surveyors' Assistants' Professional Union.

[A report of the concluding lectures will be given in our next issue.]

STRUCTURAL SAFETY

In view of certain structural mishaps that have taken place recently, it is interesting to note that a joint committee has been constituted in America to inquire into the matter. The following, according to the *American Architect*, is a resolution which outlines the scope of the work of the Joint Committee :—

"Resolved, That it is the intention of this Joint Committeee to conduct an inquiry into matters of public safety so far as they are concerned with the design and erection of buildings and other structures."

"Resolved further, that it is the purpose of the Committee to follow its investigation with the formulation of such recommendations as may seem wise for the societies represented in the Committee to endorse with respect to the procedure by architects, engineers and builders, and to recommend also such legislation, if any, as may seem expedient to bring about improved conditions."

"Structural safety and the responsibility therefore is not definitely established in this country (America). Buildings collapse, often attended with fatalities, and no person is adjudged to be guilty of negligence or incompetency. There are many elements which enter into structural safety, among which are the architect and engineer, and their supervision of the construction, the contractors and their supervision of the construction, their use of specified materials, and the adequacy of the construction equipment.

"One of the principal aims of the Committee will be to consider and correlate the relationship of all these elements and to formulate such legislation as will definitely fix the responsibility for structural safety. The recommendations of this Joint Committee will be submitted to the organisations which they represent. The ultimate intention is to secure legislation conforming to these recommendations. This is an important matter which affects everyone connected with the building industry, and the Committee should receive all possible assistance in its work."

THE NATIONAL HOUSING MANUAL *

Mr. Aldridge stands high among housing pioneers, and his great knowledge and experience invest "The National Housing Manual" with peculiar importance. Beginning with prehistoric cave and lake dwellings, the author, taking us through Egypt and Assyria, Greece and Rome, reaches the foundations of existing work in Chapter 7, which deals with the influence of the Renaissance on housing conditions. The bulk of the book is naturally reserved for modern times from 1760 to the present day. The book is not an impartial survey in the sense of merely giving all sides of the question and leaving the reader to form his own conclusions; its attitude is well summarised on page 196: "There are four arguments—each of them unanswerable—in favour of the deliberate adoption of a comprehensive State Housing policy in every civilised country." Mr. Aldridge is the uncompromising champion of State housing as against housing by private enterprise, although in the last paragraph on page 477 it is hinted that State financial aid should not be a permanency. The Housing and Town Planning Council hardly does justice to those who consider that any form of State housing—either by State or Municipal building or by subsidising private enterprise—is an evil only to be tolerated so long as it is really necessary, but who also insist that we should never revert to the old form of indiscriminate building.

Every thinking man knows that to go back to 1890 methods would be absurd, but he wants to know why State housing is the only alternative. It has been said that the truth lies in reconciled differences, and may it not here be found in a course midway between uncontrolled private enterprise of the 1890 type and State housing of the Addison type? We believe that if there had existed a controlling public conscience towards housing during the nineteenth century it would have been possible to build the right kind of house at the right density on economic lines, and we are also convinced that State housing cannot be carried on really efficiently, in which belief we are supported by Major Barnes, himself an advocate of State housing.

Now it is essential that housing shall be carried out by the agency that can do it most cheaply on proper lines, and it is no less vital that the agency in question shall be under more drastic and efficient control than was provided by the old by-laws. We need not marshal evidence to show that the house-builder can organise and build more cheaply than anyone else, and the ever-present need for control cannot be better shown than by the poor results achieved under Dr. Addison's grant to private persons. We are therefore in agreement with Mr. Aldridge to the extent that the State should take the reins of control and drastically exercise its power through the local authorities, but this does not in any way imply permanent State or Municipal housing. The two issues are separate and distinct. Everyone recognises that a State subsidy is necessary to tide over the present crisis, and that somehow the disused brickfields must be reopened, but in dealing with Major Barnes's book in these columns we emphasised the principle that industry must eventually pay its own employees wages sufficient to keep them in a suitable condition, and this postulates the payment of an economic rent for an adequate house. If industry as a whole cannot do this, it cannot be done at all, since even if the houses are paid for entirely by the State, the money still represents the proceeds of industry. Industry always has to bear the burden, and a direct shouldering of responsibility is surely better than an indirect and wasteful spreading of the same burden on the same shoulders. Between these two alternatives there lies the difference between a healthy self-reliance and a supine shelving of responsibility on the State and local authorities. If, therefore, "a comprehensive housing policy" were to mean a policy of permanent close control in amenities and density, coupled with a determination to abandon subsidies as soon as industry could stand on its feet, we should agree wholeheartedly. Once the housing arrears have been overtaken, State interference should be limited to maintaining the standard, but not through a policy of permanent subsidies or of doing the work itself. It would be a pity if hostility and prejudice to private enterprise in general should strangle or delay the results that it might achieve; the end is more important than the means, and the arrears with which we are faced are appalling. Supposing it were found that State housing could produce 1,000 houses at a cost of £600,000, but that private enterprise could, under control, produce the same houses for £500,000, is it not clear which method we should adopt? Comparative figures of costs, showing how municipal houses compare in cost with houses of the same type built by private enterprise at the same time would be instructive.

Any book containing such a mass of information must of necessity be bulky, but this work is at least 25 per cent. larger than it need be, and is correspondingly more expensive. Much that is formidable in this volume is due to a style which all through fogs the issue and strains the intelligence of the reader, diverting it from the point. We lay some stress upon this fault because every writer is liable to it, no one more so than the busy man who has little time to turn his phrases and whose work contains the findings and opinions of various committees. The verbose style is here definitely injurious because it does not give the excellent subject matter a fair chance. The real meaning lies hidden like silver surrounded by layers of newspaper. It is precisely because the book is so extremely valuable that we mention a fault that can be avoided in future. As a reference book for the use of local authorities this work is unrivalled. It contains the full text of the thirteen Housing Acts passed from 1890 to 1923; it describes the formation and scope of public utility societies; it enters fully into past evils; and contains excellent guidance for the future in all relevant matters, including estate development, the planning and design of houses and the clearance of slum areas. We are glad, therefore, to see that it comes within the terms of a Local Government Board memorandum enabling local authorities to purchase out of the rates books immediately connected with the duties of local government, and that at the time one writes some four hundred local authorities have ordered copies.

Whatever housing policy may be adopted by this or any future government, the responsibility of maintaining a high standard will rest upon the shoulders of our local authorities. The work of interesting and educating these public bodies has been carried out mostly by the Housing and Town-Planning Council; it is, therefore, only fitting that the secretary of this body should produce the first volume that deals with every facet of the housing question.

* "The National Housing Manual." By Henry R. Aldridge. (The National Housing and Town-Planning Council, 41, Russell-square, London, W.C.1. 1923.) Price £2 2s. net.

Town Planning.

The text of the Bill, supported by Lord Muir-Mackenzie, and entitled "An Act to consolidate enactments relating to Town Planning in England and Wales," has recently been issued. It deals with the power of local authorities to prepare or adopt town-planning schemes and provides that the council of every borough or other urban district, containing a population according to the census taken in the year 1921 of more than 20,000, shall, before January 1, 1929, prepare and submit to the Minister a town-planning scheme, in respect of all land within the borough or urban district, in respect of which a town-planning scheme may be made under the Act.

LIBRARY PLANNING

We take the following extracts from a article by Mr. W. W. Fortune in the Februa number of *The Librarian*:—

In remodelling an old library or in plannir a new library for the open-access syste conditions of space and light govern the lay-o so that no two libraries are precisely the sam One of the most important considerations that of supervision or oversight of the librar One cannot altogether stop the loss of book but with adequate supervision the loss can minimised. Ample gangway space must allowed for readers. A little expert plannir may make all the difference between succe or failure.

In planning the staff enclosure, a knowled of a few leading requirements will make for t efficiency of the service. Lack of attention detail inevitably causes trouble, confusion a waste of time. The first consideration is th the "in" counter requires to be longer than t "out" counter, because the charging syste takes space, and for quick service the corre position for the issue trays is on the "in counter—the closest point of service. Anoth reason for the extra length of counter is accommodate a queue of readers at rush hou The "out" counter only requires sufficie space for the divisional racks in which the da issue is roughly classified. A useful purpo can be served by marking off a portion of t "out" counter on which readers can lea their bags, parcels, &c., whilst in the library.

In order to protect the charging trays a other work on the counter top, it is advisal to have a raised ledge 9 or 10 in. high by 6 i wide, on which readers can place their boo This ledge can be of plate glass supported brackets. The use of the return end of t staff enclosure as a book-shelf for return books is a debatable point. Readers collect front of the staff enclosure and interrupt t oversight of the library. An alternative plan for the bookshelves to face the staff. If divid up into a series of bins, one for each class, t books can be roughly classified as they come and cleared at convenient intervals.

The entrance and exit wickets should not wider than 2 ft. Wide and heavy wickets the cause of trouble to the mechanism controlli them. The equipment of the interior of t staff enclosure requires consideration. Defin spaces for definite purposes expedite the servi Desk accommodation for the staff is necessa A swing stool is convenient as it can be put of the way when not required. Card draw are required for the register of borrowe Orderly racks and ticket racks are wanted the enquiry window.

Open-access is a live proposition, and tendency is to limit the size of the library seeing to it that only live books are shel Weeding-out is therefore a matter for conside tion. Considerations of space, position entrance, size of library, probable issue, num of staff, are factors which control the plann of a library for open-access.

Modern Swedish Architecture.

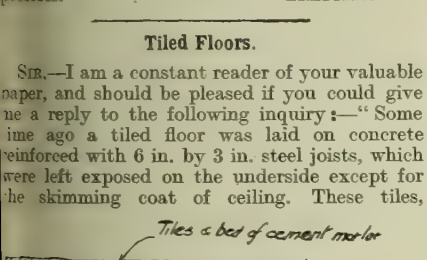
An important exhibition of "Modern Swe Architecture" has been arranged by the Ar tectural Association, which, with the permiss of the Council of the R.I.B.A., will be held the Galleries at 9, Conduit-street. The hibition will consist of drawings and ph graphs of the work of twenty of the lead architects of Sweden, together with models various buildings, including a large model the new Town Hall of Stockholm. The exh tion will be opened on Monday, May 12, 3 p.m., by His Excellency, Baron Palmstie Swedish Minister in London. All member the Architectural Association are invited attend the opening. On the evening of this at the General Meeting of the Architect Association, a paper, on "Modern Swe Architecture," illustrated by lantern slides, be read by Mr. Hakon Ahlberg, of Stockh

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

*** We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.*

Swept Tiling.

Sir,—The term "swept tiling" is probably derived from the natural arc described by the head of a broom during sweeping operations. We speak in similar fashion of the "sweep" of a drive or of a car "sweeping round a corner." As applied to tiling it indicates the curve of a roof which is circular on plan, or more particularly the curve of a valley where neither special valley tiles nor lead gutter are used, the surfaces of the two arms of the roof being "swept" round in a curve to meet in continuation the one of the other without an abrupt change of surface.



The method of procedure is to fir up the valley to an easy curve upon which the battens will curve upwards to meet at right angles. The tiles are then laid in the ordinary fashion until the adjacent two of each course meet at their bottom corners, when the remaining gap is filled up with ordinary "tile and half" tiles laid alternately right and left-handed.

The practice is of ancient precedent and appears very efficient and effective in actual practice, as do most processes evolved out of the ingenuity of the craftsman who wishes to be as independent of the help of other trades as possible.

"Tradition."

Tiled Floors.

Sir,—I am a constant reader of your valuable paper, and should be pleased if you could give me a reply to the following inquiry:—"Some time ago a tiled floor was laid on concrete reinforced with 6 in. by 3 in. steel joists, which were left exposed on the underside except for the skimming coat of ceiling. These tiles,

Section through Floor.

although laid in a good bed of cement mortar, have become loose. Do you think the exposure of the ironwork is likely to account for this, and if the reinforcement had been 5 in. by 3 in. with 1 in. of covering on underside, things would have been different?

J. W. Watson.

Asbestos Pantiles.

[Reply to "Anxious."]

Sir,—Yes, we had the first batch of these pantiles (dun colour) made and fixed by the manufacturers. They have now been on the building two years and are quite satisfactory. We don't think you need have any anxious moments as to the use of them. We had something like 20 squares laid; the colour is still good. You will not find them lift, as each tile is fixed with one long galvanised slate nail.

G. Cummins & Son.

Houses in Blocks of Four.

[Reply to "Housing."]

Sir,—I think there is little doubt but that the "interlocking" arrangement of the first floor plans of blocks of four houses is the more economical arrangement, entailing as it does only the provision of a centre arch or beam across the open passage way. The arrangement of a centre division wall on the first floor demands a series of beams across and a central beam through the building down the centre of the passage way.

Beyond the considerations of economy, the first method has the additional advantage of allowing a central window over the passage way as a desirable architectural feature.

The main disadvantage is that it is extremely difficult to arrange convenient first floor plans to both houses concerned. The central wall allows considerably more freedom in planning, and more recent practice seems to indicate that the majority of architects consider that the slight extra cost in beam work is well repaid by the added convenience in plan.

"Majority."

Cost of Shops.

Sir,—We should be very much obliged if you would state what you consider a fair price per cub. ft. for rebuilding shops after a fire, exclusive of fixtures.

Copp Bros.

Barry.

[Reply to Messrs. Copp Bros.]

Sir,—It is quite impossible to quote a figure that would prove a useful guide upon which to base an estimate for the work indicated. Such work varies enormously according to the class of building intended, and the materials proposed and the district in which the work occurs, besides the probable outcome of current trade disputes. Building work varies in cost by more than 50 per cent. in different parts of the country. Local advice will be more useful than anything I could put forward.

G. M. A.

Stains on Cement.

Sir,—I shall be much obliged if any of your readers can inform me if there is any known method, other than colouring or painting, for cleaning and removing deep stains and vegetation from cement compo external plastering of a building with heavy dressings and enrichments so as to restore it to anything like its original appearance and even tone.

Torquay. A. Watson.

THE SURVEYORS' INSTITUTION

Mr. J. Inglis Davidson (president) presided at the annual dinner of The Surveyors' Institution at the Connaught Rooms recently. About 350 members and guests were present, including Lord Parmoor (Lord President of the Council), Lord Dunedin (Lord of Appeal), Right Hon. John Wheatley, M.P. (Minister of Health), Sir Ernest Pollock (Master of the Rolls), Sir Francis Floud (Secretary, Ministry of Agriculture), Sir Edwin Savill (vice-president), Mr. J. D. Wallis (vice-president), Mr. Dendy Watney (vice-president), Mr. J. H. Hunter (chairman, London County Council), Right Hon. H. P. McMillan, K.C. (Lord Advocate), Colonel G. E. Kent (president, Auctioneers' and Estate Agents' Institute), Sir John Oakley (past president), Sir Richard Hopkins (chairman, Board of Inland Revenue), Mr. John Wilmot (past president), Mr. L. G. Dease (president, Land Agents' Society), Sir Theodore Chambers, Mr. Eustace Hills, K.C., Brigadier-General Sir Henry Maybury (Director-General of Roads), Sir Howard Frank, Mr. E. M. Konstam, K.C., Mr. C. H. Bedells (member of the council), Lieut.-Colonel George Courthope, M.P., Colonel E. M. Jack (Director-General, Ordnance Survey), Mr. Stanley Hicks (member of the council), Mr. H. M. Cobb (vice-president), Mr. W. R. Smith, M.P. (Parliamentary Secretary, Ministry of Agriculture), Mr. W. Edgar Horne (past president, Mayor of Westminster), Mr. Arthur Vernon (past president), Mr. J. A. Gotch (president, Royal Institute of British Architects), Sir W. A. Robinson (secretary, Ministry of Health), Mr. E. A. Rawlence (member of council), Mr. T. H. Ryland (president, National Farmers' Union), Sir William Haldane, Sir Henry Rew, Sir Harry Courthope-Munroe, K.C., Mr. Christopher Turnor, Mr. C. B. Fisher (member of council), Professor Dunstan (principal, Royal Agricultural College, Cirencester), Mr. J. E. Bidwell (member of council), Colonel H. Cobb, Lieut.-Colonel J. Grimwood, Sir Gordon Nairne, Mr. G. S. Rentoul, M.P., Sir Henry Tanner, Sir William Wells, Mr. A. Norman Garrard (hon. secretary), and Mr. A. Goddard (secretary).

Sir Theodore Chambers, in proposing the toast of "His Majesty's Ministers," said it was the stability and character of Englishmen that carried England through. Lord Parmoor had been one of the oldest friends of the Institution, and they also came into intimate contact with the Ministry of Health. They wished Mr. Wheatley every success in dealing with the problems of housing, town planning and slum areas, and were prepared to give him all the information and knowledge within their power.

Lord Parmoor (Lord President of the Council), responding, said they had to do what was best for social service and social claims so that every party should have an interest in the country, a fair hearing, and a fair representation. In these complex problems the Surveyors' Institution played a part of responsibility. Members of the Institution were in their way intellectual trade unionists; they protected their own members in order that they might carry out their work in a proper manner. That was the duty of all trade unionists, whether manual or intellectual, as regarded their objects and aims. It was of the utmost importance that in any attempt to solve the complexity of modern life any Government, whether Labour or not, should have all the advice and assistance it could get from an experienced body like the Surveyors' Institution.

The Right Hon. John Wheatley said he was delighted to be able to express to them, on behalf of his Ministry, their appreciation of the generous manner in which they had come to the aid of that department in carrying out the essential business of the country. During his period at the Ministry of Health, continued Mr. Wheatley, the department had had to undertake the purchasing of 48,000 acres, at a cost of £10,000,000, an average of something like £200 an acre. They had been indebted to the Surveyors' Institution for a great deal of assistance in intelligent criticism and suggestions in connection with the procedure and practice of town planning. Local authorities had been under an obligation to the Institution for similar assistance in the work which they had had to undertake. They had also been indebted to them for the assistance they had rendered in connection with the proposals for a reform of the system of rating and valuation. They had requested him specially to thank the Institution for that assistance, and to tell them that it was greatly appreciated.

Sir Ernest Pollock (Master of the Rolls) and the Right Hon. H. P. McMillan (Lord Advocate) responded to the toast of "The Bench and Bar," proposed by Mr. H. M. Cobb.

Lord Dunedin (Lord of Appeal) submitted the toast of "The Surveyors' Institution."

The President, responding, said Lord Dunedin had referred to the wonderful growth of membership and influence of the Institution since its foundation in 1868, which, starting with the figure of about 200, was now over 6,000. Since their examination system was established over forty years ago, upwards of 15,000 candidates had sat for examination, of whom 10,000 had proved successful. The foundation of the Institution scholarships, and the establishment of the College of Estate Management had both proved valuable factors in raising the standard of professional knowledge by providing facilities for sound technical training. Although the bill for the registration of the profession introduced last session did not progress further, he hoped that in the near future Parliament might recognise the necessity of protecting the public from unknowingly employing unqualified persons on the important duties which surveyors were called upon to perform. In conclusion, the President referred to their close association with the architects' profession, and said that perhaps the greatest triumph of the architect in these days would be the designing of a workman's dwelling which could be let at an economic rent, but the higher efforts of that profession lay in the designing of buildings suitable for the site.

THE BUILDING TRADE

BUILDING EXHIBITION HANDICRAFT SECTION

"THE NEW CRAFTSMANSHIP."

THIS was undoubtedly one of the most interesting and intrinsically, perhaps, the most important portion of the recent exhibition, because through it is projected the promise of the future in building and craftsmanship. The work of the different schools participating in it is seen to be putting forth the buds and blossoms of a new spring hue for craftsmanship, fuller of vitality, and freed from many old conventions. They form a retaliation on the standardisation threatening a helotry for the worker and relate us once more to tradition. Much credit is due to the direction for the insistence on the real issues in relationship to art, which founds it on the labours of the people rightly guided, through a training in craftsmanship shaped on the true principles of construction, the resources lying in materials and the human impulse which would preserve freedom for personality.

The schools contributing to this exhibition were the following:—The Northern Polytechnic Institute; the London County Council School of Building, Brixton; the Trades Training School, Great Titchfield-street; Regent-street Polytechnic; Borough Polytechnic Institute; and one or two provincial schools. Among those enumerated, the Northern Polytechnic Institute, to whose good work we have before drawn attention in these columns, takes a high place, the students' work exhibited being of the most creditable character. The average age of students is about 16. In the masons' section we have already referred to a charming headstone, the only defect in an otherwise excellent piece of work being the rather exaggerated battering of the sides. A low relief of heraldic character, by F. Richardson, carved in marble, was very successful. There was good constructive work shown in the joinery section, and a well-carved oak panel of "linen fold" design deserves mention. The craft of lead work was illustrated by good examples, the successful rain-water head and ventilating head being among the best. The painted decoration shown, though painstaking, was lacking in any particular merit, the designs for friezes being somewhat conventional in the "use and wont" sense of the word.

The Trades Training School exhibit, of which Sir Banister Fletcher is the director, showed work of quite equal merit, and there was much to interest us, some of the examples being quite amongst the best in this Craft Section. There being apparently no age limit for the student, there was work shown by adults, such as a figure panel of stained glass. Other leaded glass, fresher in character, was also shown, and one with a leaf pattern on plain glazing was quite successful. Metal work was shown of varied character; one example to be noticed being a small balcony front, or screen, apparently incomplete, as the parts were not all welded together; this was of a well-designed, flowing character, and conveyed the pleasant impression where sensibility to the beauty of form and curvature has been appreciated. A phenomenon of quite distressing character at the present time, when contrasted with these attributes, is the cast-metal work to be seen on some of the large new buildings going up in central London. We inquired recently of an architect the reason of the stark and baldly angular design, so standardised and poor, to be observed in the iron screens in front of the windows and elsewhere, which elicited the reply: "I suppose because it is cheap." But we have instances from an earlier date of cast-metal work quite successful in its freedom of design, forming a charming contrast to this rigid emasculated iron work, which serves so little purpose as ornament. We are training students in these schools towards the new craftsmanship which is directing itself in form and spirit to the recovery of the old, applied to modern conditions, and we must embrace the hope that the large employers, contractors and architects co-operating in this movement will absorb more of this better spirit. Examples of graining were on view in the Trades Training School exhibit as an attempt to revive a craft much fallen into decline, but which in the case of old examples scattered about the country has quite its own characteristics and charm. We must look to such craft training as is to be seen at these schools to recover the human impulse from the standardisation which is always in danger of overwhelming it, and in this work the co-operation of employers and architects is most important, and their responsibility towards it is great.

The exhibits of the L.C.C. School of Building at Brixton included painted friezes, drawings of period interiors, heraldic painting, joinery, masonry, lead work, colour combing, etc., from which the scope and variety of the instruction might be discerned, and much of the students' work was deserving of appreciation. We confess, however, to regarding with mixed feelings the well-executed and rather elaborate drawings of "period" interiors, which seem to us not quite in the spirit of the aim for vital craftsmanship. These are of a somewhat unreal and somnambulistic character, though very well executed. Nor do we think it desirable to encourage a side of decoration and furnishing so unrelated to the realities of present life. Would it not be better to show us how under modern conditions we may best create beautiful surroundings growing really out of our life and its needs, which is towards greater simplicity? Surely the new craftsmanship fostered in these schools—which is a return to the spirit of the old—is better occupied in shaping what fills our present life rather than in composing interiors, disembodied from the reality on which our work should rest. But though saying this, it is not in any disparagement to the standard of the work of this school, which is in no way less worthy of attention than others we have noticed.

The Regent-street Polytechnic was another school showing students' work of a very capable character; some good woodwork was to be noticed, though an exhibit of "Gothic" oak panelling was not among the best. There was a sense of youth and vitality over the students' work, an enthusiasm which it was a great credit to the direction to have created. For their work has particular significance to-day. The absence of tradition so observable may, through the work of such schools—which brings the student once more into association with traditional methods—recover for us what we have lost, and in the fulness of time re-forge the links of a broken tradition which ruthless industrialism has sundered. The best craftsmanship is forever to be associated with the best design; as we restore this human impulse, coupled with sound construction and the inspiration of materials to our labour, we may see changes fraught with blessing to the future of life.

It is better to found our craftsmanship on a good groundwork of traditional examples, leaving it to happen that our own personal feeling will impose itself later, writing over the old the spiritual experience of the new. But this groundwork should have its source in the best tradition, and for the prospects of the world we shall learn best through the

eedom and aspiration of mediæval art. nd it is in considering this point of view at we would urge upon the directors of these hools, so evidently capable and desirous of iblic service, that the standard of design t before the student is of the best, not in e worldly sense of its glittering facilities, ut of its spiritual worth, on the impulse hich, drawn from what was above it, kept it ee from worldly influences and founded it on eauty and truth.

Owing to the illness of the Earl of Birkenead, the prizes to the winners in the craftsanship competitions were presented by rincess Louise, Duchess of Argyll. Mr. J. A. Gotch presided, and said the interest of the Royal House in art and industry was too well-known to need any sort of remarks from himself. He considered all competitions in craftsmanship were a salutary and a wholesome departure. It induced those who were engaged in the crafts to do their best in the time at their disposal. It also excited the spirit of emulation, which was healthy in all sorts of craftsmanship. The work done that afternoon, in a period of six hours, was most gratifying in view of what they heard of the limitation of output. In conclusion he had great pleasure in proposing a vote of thanks to Princess Louise.

Princess Louise then presented the following prizes and diplomas:—

Section.	Name.	School Attended.	Award.
UMBING (over 20)	T. E. Freeman	Brixton School of Building	1st Prize.
	F. J. Lake	Brixton School of Building	2nd ,,
	E. C. Fromhold	Polytechnic, Regent-street	3rd ,,
	E. J. Hoyle	Brixton School of Building	Diploma.
	A. Porter	Trades Training School, Gt. Titchfield street.	,,
	H. Gennills	Trades Training School, Gt. Titchfield-street.	,,
,, (under 20)	J. H. Galliford	.. ..	1st Prize.

BUILDERS' FOREMEN AND CLERKS OF WORKS

The Institution of Builders' Foremen and Clerks of Works held their annual dinner recently at the Holborn Restaurant. Sir Frederick Rice presided.

After the loyal toasts had been honoured the President proposed the toast of the "Houses of Parliament."

Mr. Wheatley, responding, said Sir Frederick had referred to builders in the House of Commons. He (Mr. Wheatley) did not see why the House of Lords should not be recruited from the ranks of the Institution of Builders' Foremen and Clerks of Works.

As Minister of Health, continued Mr. Wheatley, he hoped to remove the dreadful sufferings that resulted from the shortage of houses. One of his first desires had been to bring the various sections of the building industry together, and tell them that they were the people to provide houses if they were to be provided at all. He wanted them to put their knowledge and experience at the disposal of the State, and help the Government out of its housing difficulties. In reference to the Housing Report, Mr. Wheatley said it represented a large amount of time, labour and service by experienced men that had been placed gratuitously at the service of the nation. He thanked the building industry for the work they had put in the Report. He hoped the same spirit would be put into the actual solving of the housing problem itself. They had to remember they were building not only for this generation but for the generation to come. He hoped they would build houses worthy of the British race.

Sir Frederick, in proposing "The Institution," said it was founded in 1842 by four people, three of whom were builders' foremen. Up to the present they had spent £26,318 in pensions, and he made an urgent appeal that the fund should be supported.

After Mr. F. J. Dexter had responded, Mr. Roland B. Chessum, proposing the "Architects and Surveyors," said, as a representative of the London Master Builders' Association, he thought they would receive the most careful consideration from the authorities with regard to the subjects that were occupying their joint consideration. They should not consider that the relations between representative parties must necessarily be antagonistic — the relationship had changed even in his lifetime.

Sir Chas. J. Ruthen responded.

Mr. E. J. Partridge then proposed the "Master Builders and Contractors," to which Mr. F. Thorne responded.

Other toasts were given by Mr. F. L. Dove, Sir Nicholas Grattan Doyle; and, in conclusion, the President proposed the "Honorary Secretary," to which Mr. E. Scarchfield responded.

THE BUILDING EXHIBITION.

On Wednesday last week, at the main stand of *The Builder*, at the Building Trades Exhibition at Olympia, a very large number of exhibitors gathered for the purpose of listening-in to the choirs, the opening ceremony, and H.M. the King's Wembley speech, which, by arrangement with Messrs. Burndept, Ltd., was broadcasted there.

Metal Work.—In our issue of April 18 our description of Messrs. Haskins' stand at the Building Exhibition was a little misleading. There were, of course, only two processes exhibited. One was solid extruded bronze and the other Haskins' "Kalamein" bronze drawn on a hardwood core. This bronze was nearly ⅛ in. thick, as fully described in their leaflet.

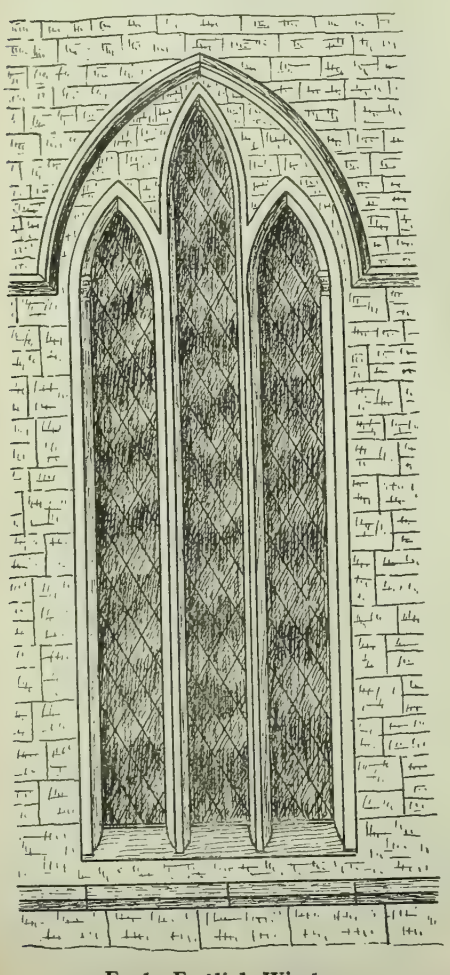
We regret that in our issue of April 18 the name of the Lewbart Manufacturing Co., Ltd., was spelt incorrectly.

BUILDING THROUGHOUT THE AGES

In his sixth lecture* on "The Romance of Building Throughout the Ages," given before the junior members of the Liverpool Branch of the Amalgamated Society of Woodworkers, Mr. George W. Thompson dealt with the English Gothic period.

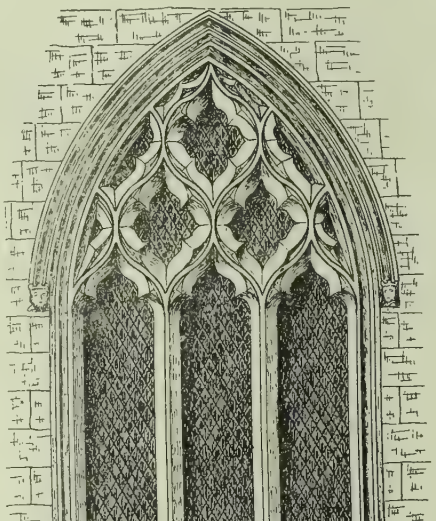
The buildings erected by the Romans in England, he said, were destroyed by the barbarians who followed them, and even after the Saxons were converted to Christianity they did not prove good builders. They dwelt in wooden houses, and their churches were usually of wood. The few stone buildings remaining were constructed of rough rubble with dressed stones at the angles. Openings were either circular or triangular headed, and were sometimes divided by a baluster. Roofs were probably of wood or loose stones arranged in horizontal layers meeting at the apex. Piers and columns were short and crowned with square blocks. Mouldings consisted of simple ovolos and hollows.

English Gothic architecture could be conveniently divided into the following periods :—



Anglo-Saxon ..	449 (date of arrival of Anglo-Saxons) to 1066 (Conquest).
Norman ..	1066 to end of twelfth century.
Early English..	To end of thirteenth century.
Decorated ..	To end of fourteenth century.
Perpendicular..	To end of fifteenth century.
Tudor	First half of sixteenth century.

Norman was bold and massive; windows usually narrow and deeply splayed with semi-circular heads; doorways deeply recessed and richly ornamented with zig-zag moulding and bead; roofs vaulted or of wooden trusses, usually of king-post form inclined at 45 degrees, and covered with lead; columns low, massive, polygonal or circular. Clustered piers were also employed. Capitals were of cushion form and sometimes carved and scolloped. Mouldings: Zig-zag, chevron, billet, double cone, and embattled.

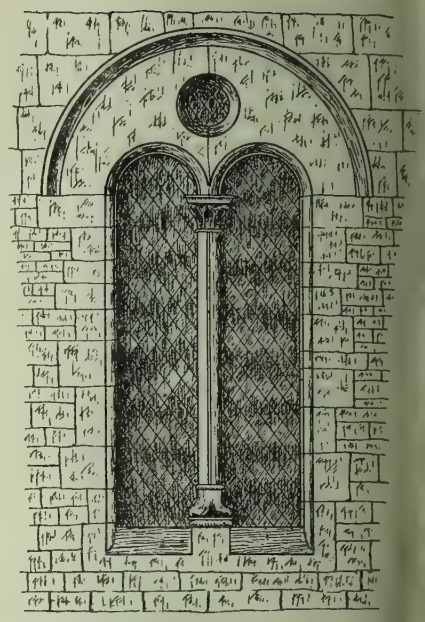


Early English, also known as Lancet and Pointed, was distinguished by tall, narrow, lancet openings, boldly projecting buttresses and pinnacles, and steeply-pitched roofs (60 deg.). Slender groups of shafts were used in place of massive pillars. Walls were thick and built of rubble; pointed arches and richly ornamented doorways with carved foliage were used; tracery was developed; capitals were frequently moulded; mouldings bold and deeply undercut.

Decorated, also known as geometrical and curvilinear, had increasing richness of ornament; bigger windows of two or more lights divided by mullions; roofs of moderate pitch and sometimes with open framing: columns composed of small shafts surrounding and attached to a central column; capitals carved with foliage resembling leaves of oak, ivy, maple, and vine; stained glass was introduced; fittings, such as screens, choir stalls, pews, and pulpits were improved; shrines and tombs became elaborate; crockets and finals to pinnacles and canopies increased in importance.

*Earlier lectures in this series were given in *The Builder* as follows :—1, Feb. 1; 2, Feb. 15; 3, Feb. 29; 4, March 14; 5, April 4.

Early English Window.



Decorated Window.

In the Perpendicular, also called rectilinear, walls were profusely decorated with sculptured panelling; parapets were embattled; flying buttresses were used; windows consisted mainly of mullions which produced a perpendicular effect; roofs were open timbered of low pitch and of hammer-beam construction richly carved. Westminster Hall roof, constructed in 1399, was considered one of the finest wooden constructions in history. The columns consisted of four circular shafts; ornament embraced sculptured foliage, the Tudor rose, the fleur-de-lis, and the portcullis.

The Tudor style was included in the last fifty years of the Perpendicular period, which it resembled.

The great difference between Classic and Gothic was that the former was always rectilinear, *i.e.*, every support or part supported was either horizontal or vertical, whereas in Gothic the horizontal, vertical and oblique lines all tended to support each other.

Classic buildings were always symmetrical, whereas in Gothic there was no symmetry whatever. Look at the regularity of the Parthenon and compare it with the irregularity of West minster Abbey. As in Classic styles, the grea principle followed was to secure ornamental con struction, not ornament for ornament's sake In both styles ornament or decoration forme part and parcel of the structure.

Norman Window.

SMOKE ABATEMENT

The Smoke Abatement Society states that deputation of the recently formed Inter-Parli mentary Committee on Smoke Abatement waite upon Mr. Wheatley, the Minister of Healt recently. Those present included Lord Newto Mr. E. D. Simon, M.P., Sir Harry Brittain, M.P Mr. Sidney Jones, M.P., and Major J. B. Birchal M.P.

It was urged by the deputation that furth steps should be taken by the Ministry of Heal to give effect to the recommendations of t Departmental Committee on Smoke Abatemer and to introduce without delay into Parliame a reasonable measure to bring into line wi modern methods of power production t present antiquated law with regard to smo nuisances.

The opinion was expressed that a Smo Abatement Bill would be regarded as a n contentious measure, and that there would a general disposition on the part of all politi parties to facilitate the passage of a Bill.

In the course of his reply, the Society sa Mr. Wheatley intimated that the Ministry Health would at once consider how far it w possible for the Department, by encouraging a facilitating educational work in the provinces, help forward the smoke abatement moveme They would further give sympathetic conside tion to the request of the deputation that effort should be made to prepare and submit Parliament a further Bill, at an early date.

In connection with the above it is interest to note that Mr. W. D. Scott Moncrieff, Brighton, claims to have invented a smoke fuel which will remove the smoke nuisance in cities. The fuel consists of ordinary coal I tially carbonised in a special retort, and it be used for household and commercial purpo It is stated that it burns brightly and gives great heat without the slightest smoke.

Mr. A. A. Lucas, the manager of the Newha Gas Company, stated that experiments he made with the new fuel extending over tw months had proved very successful. "It g out no smoke when consumed," he said, "ar of almost the same thermal value as coal. by-product of tar, which is very rich in light is doubled, and the gas extracted is of gre calorific value than that obtained by the methods."

ENT RESTRICTION

shall soon expect to receive a copy of Rent Bill delivered each morning with ily paper. Mr. Simon's Bill, as amended e Government, may be rushed through nent at short notice; but it remains seen whether any provision will be introto take the place of clause 1 in the Govern- Bill, which was recently negatived. Simon's Bill stands it practically consists clause repealing paragraphs (iv) and (v) section (1) of section 4 of the Rent tion Act, 1923, and substituting the ing clause for them: "When the landlord husband or wife of the landlord became rd before July 31, 1923, and the dwelling is reasonably required by him for occuas a residence for himself, and the is satisfied that, having regard to the tive accommodation available for landnd tenant respectively, greater hardship rds conditions of living would be caused using to grant an order or judgment for sion than by granting it."

understand the Government proposes ling this clause by striking out any nce to the date at which the landlord e landlord, and any mention of the nd or wife of the landlord, and by adding therwise" after the word "accommodaand that it is also proposed to incorporate 3 of the late Bill in this Bill.

pointed out in our issue of last week the effect clause 3 would have, and that it l be limited to the case of working-class ngs and evictions of working-class tenants. s a clause is introduced in this Bill with nce to the eviction of unemployed tenants, il to see that any case has been made for hurried legislation. Legislation on Rent istion is becoming a craze, and every e member may introduce a new nostrum lling landlords and restricting—not rents—he provision of houses.

recent case, Williams *v.* Perry (*Weekly*, April 5), raised an important point the Rent Acts. Certain premises, from t, 1914, to March, 1919, had been let as business premises and partly as a ng house, this being within the Acts n Grand Stand *v.* Clarke, *The Builder*, 27, 1919, now section 12, subsection (2). The tenant having gone out in March, the landlord, the plaintiff in this case, t them to another tenant, the defendant, distinct understanding that they should ed solely as business premises. The nt went into occupation, but shortly ards in breach of his agreement sublet f the premises as a dwelling house, or d them himself. The standard rent of remises in August, 1914, had been d. a week, but in January, 1922, the ad been raised to £4 a month.

action had been brought by the ff to recover rent, and in the action the ant alleged that the rent exceeded that d by the Rent Act, and he counterd in respect of sums which he said nted over-payments in excess of rent ted by the Act.

County Court Judge had given judgor the defendant on the claim and for a £16 on the counterclaim.

plaintiff appealed, and a Divisional has reversed the decision of the County udge.

the defendant it was contended that ance a standard rent attaches to a house inues to attach to the house (see sec-2, subsection (6)), and King *v.* Yorke ly *Notes*, 1919, p. 59; *The Builder*, ry 28, 1919) unless the identity of the es is destroyed (see Phillips *v.* Barnett, 2 K.B. 799; *The Builder*, September 9,

Divisional Court held that they not accede to that argument as the ent between the plaintiff and defendant e premises should be used solely as s premises was as effective as a phyconstruction to take the premises out protection of the Act.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

(For rates of wages in the Building Trade in Scotland, see page 741).

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. **Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.**

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

NORWICH.—Mr. Herbert Daniel's boot and shoe factory in Bull Close-road, has been burned out. Adjacent property was damaged.

MUSSELBURGH.—A fire has occurred at the Eskmills Net Factory.

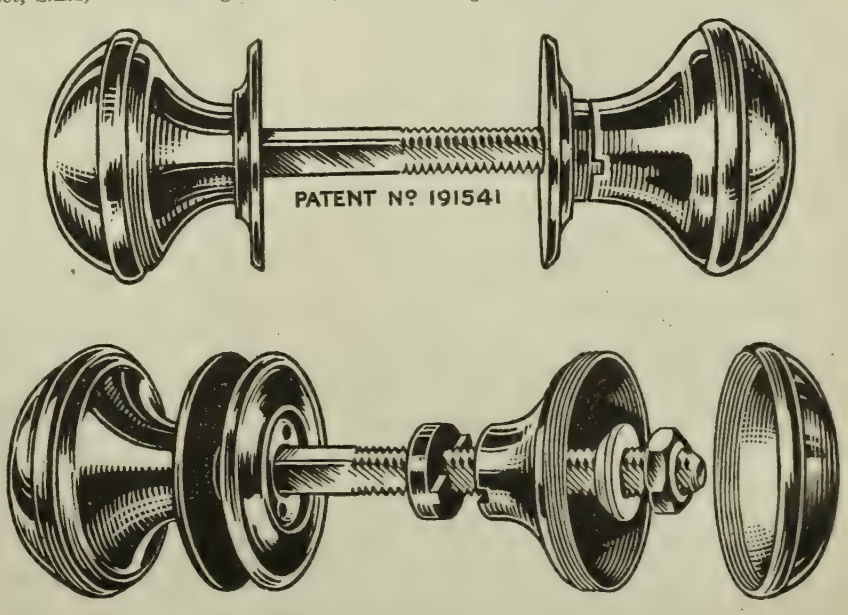
NEW INVENTION

THE "Riddick" patent door furniture was among the clever inventions exhibited recently at the Building Trades Exhibition, Olympia. The principal points of this ingenious device are:—(1) No screws, therefore it cannot work loose. (2) No parts to wear out, or get loose; and it can be adjusted to 1-100 of an inch.

The method of fixing is simple:—One knob is a fixture; the fixed knob and rose are held on one side of the door, the spindle passed through the door; the adjusting piece (which works to the thickness of the door to 1-100th of an inch) is then fitted, followed by the rose and half of the second knob; the washer is then put on the spindle, followed by the locking nut; and the other half of the knob is then screwed on tightly, resulting in a perfectly rigid fixture. It is suitable for mortise or rim locks.

Messrs Evans & Ronald, Ltd., 7, Denman-street, S.E.1, are marketing this fitting.

MUNICIPAL TRADING



A BILL has been presented by Mr. H. Morrison, supported by several Labour Members, including Mr. Barnes, Mr. Lansbury, and Mr. W. Thorne, entitled "The Local Authorities (Enabling) Bill," which would give the councils of counties, the larger boroughs and the urban districts the widest powers to purchase, undertake, and carry on any business or undertaking within their areas for the acquisition of gain or the promotion of commerce, art, science, recreation, charity, or any other object which might be lawfully carried on by a company.

The funds are to be raised by borrowing money, subject to the sanction of the Board of Trade, up to one quarter of the rateable value in the area, and even beyond that by provisional order confirmed by Parliament.

Twenty-five years ago municipal trading was advocated as salutary, and the ratepayers were promised speedy relief in the rates from the profits to be gained; but we imagine the ratepayers have suffered some disillusionment by now, and the evidence given before the Court of Inquiry into the circumstances attending the strike on the tramways is a sufficient comment on this Bill. Tramways, perhaps, might be termed the most legitimate form of municipal enterprise and the least subject to risk, yet what was the evidence given before the Court of Inquiry? It was shown that the West Ham Tramways, for the year ending March 31, would show a loss to be paid out of the rates of £45,500. The Walthamstow Tramways Committee estimated their loss for the present year at about £13,000, or 6½d. in the £ on the rates. The Bexley Heath Council put their loss for the current year at £6,500, or 7d. in the £. The Erith Council had put the loss at £8,100, for which 10.23d. had been allowed in the rates, but the actual loss was greater, and would involve 1s. in the £. The figures for the London County Council are more particularised. When the tramways, in 1920-1, first came upon the rates, according to the report of the evidence of the Comptroller to the County Council, the loss was £590,000; the following year there was a loss of £88,000, also charged to the rates. Last year there was a net surplus of £230,000, but they now looked for a deficiency of £105,000. The undertaking had drawn from the rates altogether £698,000, and payments made to the rates were £325,000.

Are the ratepayers, besides supporting the unemployed, to engage passively in gambles of such a nature?

The present Bill provides that no payment shall be made out of the common fund for the purpose of reducing rates; but from the summary which has appeared it is by no means clear how losses are to be provided for, and at any rate such undertakings would form a charge on the rateable value of the areas.

THE SCOTTISH BUILDER

CARPENTERS' AND JOINERS' ASSOCIATION OF SCOTLAND

AT the annual general meeting of the North-East of Scotland Master Carpenters' and Joiners' Association, held recently at Aberdeen, Mr. John Buchan, Aberdeen (the President), said that the depression in the building trades dated back to 1910–11, when the influences of Mr. Lloyd George's 1909 Budget, imposing taxation on land values, began to be felt. Speculators who had looked on building as a first-class investment, providing a reasonable return, looked to other channels. Building declined, and then came the war and grievous post-war restrictions. The most serious difficulty, he continued, with regard to the recommendation of the National House-Building Committee for a fifteen years' programme of 2,500,000 new houses would perhaps be the shortage of labour. The deficiency might be met by the Joint Apprenticeship Committee's stimulus and the removal, for a time at least, of all restrictions as to the number of apprentices any one employer might have. The Committee did not attempt to deal with strikes. It had been wisely suggested that strikes should be made illegal and punishable until a Government Inquiry had been made into the dispute. Let the Government come out with a bold policy, clear off all building and rent restrictions, and let there be free trade and fair dealing in property. Let them do something to lessen the cost of materials and transport, and, above all, change the burden of taxation to something other than rents. Builders and speculators would then rally to the erection of houses, and the present deficiency would soon be met by the best of all methods—private enterprise.

OBITUARY

THE death occurred recently of Mr. James Salmon, F.R.I.B.A., which took place at his residence, 48, Jane-street. A native of Glasgow, Mr. Salmon was the elder son of the late Mr. W. F. Salmon, and was sole partner of Messrs. James Salmon & Son, architects, Blythswood-square. The firm was founded about 1825 by his grandfather, a magistrate of the city of those days, Bailie James Salmon, so that Mr. Salmon carried on the traditions of a business which has existed in the city for almost a century. In the course of his career Mr. Salmon did a great deal of work for public authorities, and among other buildings in Glasgow which were erected to his designs were a number of blocks of mercantile offices in the centre of the city. They include the Mercantile Chambers, 53, Bothwell-street; the St. Vincent Chambers, 144, St. Vincent-street; and the Lion Chambers, 170, Hope-street. Mr. Salmon was also interested in the design of internal furnishing and decorations, in which he did a great deal of work. It was one of his views that the architect should not confine himself merely to securing the beauty and symmetry of the external and interior appearance of a building, but that he should be responsible for its completion down to the smallest detail for the purpose for which it was designed.

Mr. Salmon had travelled extensively in Europe, having visited nearly every country on the Continent and studied and sketched its architecture. Besides his Fellowship of the Royal Institute of British Architects he was a Fellow of the Institute of Scottish Artists, and for many years he was a member of the Chelsea Arts Club and of the Incorporations of the Hammermen and the Wrights of Glasgow.

Sir James Lawton Wingate.

Sir James Lawton Wingate, President of the Royal Scottish Academy from 1919 until the beginning of this year, when he resigned owing to failing health, died recently at Edinburgh.

Sir James was a landscape painter and exhibited regularly in the Royal Scottish Academy exhibitions from 1865. He was 78 years of age, and was knighted in 1920.

NEW BUILDINGS IN SCOTLAND

Broughty Ferry.—The B.H. has sanctioned the erection of two-roomed houses for Broughty Ferry, under Dundee's Housing Scheme. They have also approved of the erection of 60 houses on the Forthill site.

Turriff.—The T.C. has decided to erect seven additional houses at Manse-terrace.

Brechin.—The Dean of Guild Court has passed plans for an additional block of two houses on the Trinity-road site, at a cost of £1,100; also plans for a new pavilion to be built in the public park.

Aberdeen.—Plans passed by the Corporation :—For the erection of 10 houses, and for alterations to 14 existing premises, amounting in all to the value of £19,620. The Health Committee has recommended the erection of spray baths on a site adjoining Hanover-street School. The estimated cost of this is £3,500.

Perth.—The Directors of Perth Infirmary have decided to establish a maternity ward at the Infirmary.

Wallyford.—£3,000 has been granted by the Trustees of the Miners' Welfare Fund for the provision of a miners' institute at Wallyford. A site has been secured at the east end of main street.

Prestwick.—The Dean of Guild Court has passed the following plans :—Mr. John Wyllie, cottage, in Whitehall-avenue, at a cost of £2,400; Mr. R. S. Govan, three houses, in Berelands-road, £2,400; Mr. W. Kane, four houses, in Briarhill-road, cost £2,800; Mr. W. Stewart, cottage in Crofthead-road, at a cost of £1,400; W. Govan & Sons, Prestwick, cottage in Broompark-crescent, £550; and W. Baird & Co., 12 houses in Glenburn-road, at an estimated cost of £4,800.

Auchterless.—The Standing Joint Committee of Aberdeen C.C. has decided to purchase the police station at Auchterless.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXVI.—No. 4240. MAY 9, 1924.

UNITY AND REGISTRATION

THE scheme for the amalgamation of the R.I.B.A. and the Society of Architects, which has been agreed to by the Councils of the two bodies, has now been before the profession for some weeks, and sufficient time has elapsed for opinion in regard to the proposals e crystallised. If the many communications which have d us are a reliable indication of the trend of opinion, can be no doubt the proposals have been well received—ecause of any finality about them as a solution of the lt problems which confront the profession, but because appeal they make to common sense and reason, though se common sense is after all a very rare sense such an is sometimes made in vain. We cannot think it will this occasion, and we believe it would be little short of ster if the sincere and earnest efforts of those who are ng wholeheartedly to dispose of the primary obstacle to lement are frustrated. Few of those who have given l consideration to the status of the architectural profession ve failed to see that the principal obstacle to any efforts e it a position in the country comparable with that held er great professions has been the existence of two repre-ive bodies, the Institute and the Society, and the fact he Councils of these bodies have actually agreed upon a e of amalgamation is an authoritative endorsement of lief that the scheme provides the way, possibly the only y which the interests of the profession may be advanced. from the individual opinions which have reached as, we hat the Councils of the following Allied Societies give wholehearted support to the efforts which are being to obtain unity: Berks, Bucks and Oxon A.A.; stershire A.A.; Glasgow Institute; Liverpool Archi-l Society; Manchester Society of Architects; Northern Northamptonshire Association of Architects; Notting-ad Derby Architectural Society; South Wales Institute of cts; Yorks and East Yorkshire A.A.; the Ulster Society hitects, and the Wessex Society of Architects. This es some indication of the support which the movement ving, but we know the proposals contained in the amal-on scheme have not been unanimously approved—that, s, would have been too much to expect, though we hope ll finally be adopted unanimously—and there are those ject to them because they provide for amalgamation nstead of after Registration; but what has given the a special value is that here we have definite and agreed ls by the two parties without whose support nothing e done, and that an excellent opportunity is afforded of ng at last a really representative Institute which will take e with the other great professional societies of the country g with all the prestige and power of a united profession nterests of architects and architecture and with Regis-as its first obligation.

believe we are on firm ground in stating that an over-ng majority of the members of the two societies desire amalgamation if it be the only way to advance the s of the profession, and that many of them a d to give a good deal to attain this object. But there e in both societies who have doubts and misgivings, o fear they may be sacrificing the substance for some natical gain. No cause can be won and no dispute torily settled without a frank recognition of the argu-of an opponent, and believing that the principal nts of the present amalgamation proposals are members Institute, it may serve a useful purpose to remind s of that body that the proposals of the Council arose irst instance from a desire to meet the wishes of the profession in the matter of Registration. The Institute did not proceed hastily, but took note of the fact of the substantial majority in favour of that measure which was shown by our own plebiscite and that of the Society of Architects, and finally gave its support to the movement. While this was a step which gave registrationists much satisfaction, it was soon realised that the Act of Parliament which was necessary to give architects the protection they desired would be very difficult, if not impossible, of attainment unless the Bill for the purpose were promoted by a united profession. The movement for unification which followed has resulted not only in the present amalgamation proposals, but in the formation of an opposition, whose chief supporters have been lifelong registrationists, but who fear that if unification or amalgamation is agreed to and a number of unqualified men enrolled as members without examination, the prestige of the Institute and those of its members who have passed a difficult qualifying examination will suffer, while even then Registration might prove unattainable. Implied in this argument is the admission that Registration in any event will be difficult to obtain, but in our view without amalgamation it is really the abandonment of Registration by registrationists, for no one now believes that Parliament or the country would pay any attention to such a movement unless it had behind it the support of a united profession. In our judgment all interests in the profession should support this scheme of amalgamation, especially registrationists, who might just as well make up their minds at once that the Registration of architects by Act of Parliament is unattainable without the backing of a powerful and fully representative body. If Registration is a good thing the unity now possible is an essential preliminary to obtaining it.

The fears of the opponents of the amalgamation proposal that the prestige of the Institute would suffer are, in our opinion, chimerical. Registration of architects has been obtained in other countries in much the same way as it is proposed to obtain it here, with none of the evil results which, we are told, follow. The Architectural Institute of British Columbia did not like the idea of taking everybody in, but found it was the only way to get Registration and recognition by the Parliament of the Province, and they have already found, in the course of three years, "that the process of elimination of the undesirables has commenced and has shown a much more rapid clean out" than was anticipated. In the Province of Saskatchewan, Canada, where architects have been registered by Act of Parliament since 1911, "incompetent and undesirable members who, of necessity, had to be admitted at first, have to a large extent been eliminated"; all new members must have the necessary qualifications, and the standard of architecture has greatly improved. The immediate effect of the Registration law in the State of New York is that "the hordes from the cellars and by-ways pouring into our occupation is effectually stopped, the polluted stream soon began to clear by the influx of well-trained men, and places the profession on a higher plane in public estimation." There are registration laws in twenty-three States, and not one has been repealed.

If the fulfilment of long-cherished hopes that the time would come when the architectural profession would stand before the country as a united body, determined to pull its whole weight to secure the ends it has in view, is an achievement which all architects should welcome, then surely we have a right to expect all parties in the profession to take stock of the question in no party spirit and to use their influence and vote to obtain, while there is yet time, that peace within their ranks which appears to be of paramount importance if it is to take its place with others in the public service for the good of each and all.

NOTES.

The Medal for Street Architecture.

THE choice of the Shepherd's Bush Pavilion, by Mr. Frank T. Verity, for the award of the medal for street architecture, will probably be generally acceptable, and whilst we should have hardly imagined it to be well enough known to secure the largest number of votes, the award speaks well for the sagacity of the committee. Mr. Verity has been known as an architect with definite leanings towards French grace and refinement, and some of his blocks of flats have evidenced this. Theatre design has been one of his especially successful studies, and in the Academy this year his ability in this direction will be at once recognised. Curiously, whilst he has been specially happy in his appreciation of scale in his buildings, the medal award can hardly have been largely influenced by consideration of this. The award is a recognition of an architect's attainments, and we congratulate Mr. Verity on being the recipient of the award.

The R.I.B.A. Dinner.

THE R.I.B.A. Dinner on Tuesday, a report of which we give on p. 753, was a very successful function, and though the absence of some well-known members was noted, the many distinguished men present was a pleasing indication of the position the Institute occupies in our public life. The speeches were all more or less pertinent, which cannot always be said of after-dinner speaking, and the President, Mr. J. A. Gotch, made an almost ideal speech, in which he showed by quotations from poets and authors how little architecture owes to literature in allusions to the art and what an ignorance is so often displayed by poets and writers. We are glad to think more knowledge of the art is shown by popular writers to-day, but we have still a long way to go before the subject will receive the well-informed attention it should.

The Competition System.

THE confidence that public bodies now generally place in the competition system, as regulated by the Royal Institute of British Architects, is very gratifying. There was a time when some reluctance was in evidence against placing a final decision in the hands of an assessor, but the conduct of properly regulated competitions has developed such a close co-operation between promoters and assessors that the former may be said to retain a very large voice in the matter, while the power to modify a selected design completes the protection that the R.I.B.A. conditions afford to the promoters. It may be said that the competition system is now generally accepted throughout the best informed opinion in the country as providing the best means of arriving at the best solution for any important building problem.

The Rights of the Artist.

THE French Minister of Education, M. de Jouvenel, is endeavouring to amplify the rights which artists in France possess under the law of 1920. This law enables the artist, if a work of art is put up for sale, to claim a percentage of the excess over the original price paid for it. It is established under the new decree that, if several artists contributed to the work sold, they shall share proportionate rights in the increase. It is recognised in France that it is for the general interest to encourage artists to create, by securing for them a claim on the profits of the property they have created. On any profit in excess of the original price paid to the artist, 25 per cent. we believe is the amount to which he becomes entitled. The want of equity existing is shown, even in France, where two daughters of the painter J. F. Millet are in receipt of pensions from the State, because of their straitened circumstances, in spite of the fact of the immense sum realised by the resale of his pictures. There have been glaring instances in recent years of this injustice to the artist, where his poverty has compelled him to part with his work at nominal prices, afterwards realising large profits to others. The recognition which a great artist receives is seldom that of his contemporaries, and his circumstances often compel him to part with his work for a pittance. It is but equity that both himself and his family should share in the value which he has created, and that there should be some better security for the encouragement of creative work. We hope that this country will take example from France in establishing the rights of artists on a more equitable basis.

Westminster (District) Station.

WE may easily do less than justice to the many changes which—here a little and there a little—are contributing that improvement to the amenities of London which is so desirable. And to any traveller used to the dark cavernous approach to Westminster Station, which swallowed him up into its obscure vortex, the new spacious and very

Steep Valley, Brisbane. (*See p.* 762.)

View of Town Belt, Dunedin. (*See p.* 762.)

pleasant approaches full of daylight an agreeable colour are a sheer delight. I must have been a difficult business out o its former conditions to reconstruct thes new corridors and approaches, and show us how much can be done to ameliorat conditions where there is the will t do it. The little lunettes, so poor i themselves, yet do a service in makin manifest how desirable and interesting would be if the spaces occupied b them were devoted to real mural painting fitter in scale and treatment to the sur roundings. We suggest to the enter prising publicity department of th Underground Railway that the wa spaces thus filled with brightly painte and attractive themes would set a crow on an improvement so admirably planne

The Paper Nuisance.

IT will enable us to forı some idea of the magnitud of the injury to the decenci of our corporate life that costs the Office of Work £400 per month in summer to pick u scattered paper in the Royal Parks alon and this only a small item in the expen if we include commons, greens, and ope spaces which also suffer from this abus The condition after a Bank Holiday our public spaces is deplorable, an though we believe local authoriti require those who cater for public amus ments on these occasions to clear up aft them, we have observed cases in whi this is only half done. A wind springs u and blows quantities of paper and oth refuse which attaches itself to fenc and entangles itself in all sorts of oth ways, so that the way-sides for days afte wards present a most unsightly a pearance. It is satisfactory, however, know that public feeling is aroused the matter, of which the recent meeti in the Mansion House, which had t support of so many prominent nam is evidence. It is hoped that eve society and public or private body i terested in the movement will give th support to such a much-needed improv ment. We fear that the stalls a roundabouts and swings, the fairs whi appear and disappear at each pub holiday, contribute indirectly very mu to this disorder, and perhaps some way approaching the proprietors and an appe to their public spirit would be helpf The more traditional and popular amu

nts provided for the people by these rs are in themselves excellent things, d provide cheap and innocent pleasure, ich it would be a loss to discountenance, t their methods are in need of some endment in regard to litter.

Litter in Public Places.

We are glad that public attention is being brought to bear on a point we have so often drawn attention to, e untidiness of a certain section of the blic in scattering all kinds of litter in blic places and resorts. This is a wing evil which should be attacked, it negatives, the movement which has ently received such impetus, of securing uty spots for the public benefit and the provision of recreation grounds. e nuisance is, however, not confined parks and such resorts, for the whole ntryside is being defiled by the untidy bits of a large section of the population. tention is being drawn at the moment the preservation of the Malvern Hills m injury by the quarrying operations, the beauty and enjoyment of the Hills lmost as much destroyed by the litter t is scattered about them. There is, rever, a curious difference in various ilities in this respect. In no city that know of is greater latitude allowed he public in the use of the many parks ossesses than in Bath, and yet all the ks are a model of order and tidiness. s is not the result, so far as we are re, of the enforcement of any parti- r by-law, but we imagine it arises n the fact that all classes have for y years been allowed this freedom with little supervision, and the people e, therefore, learnt to appreciate the ntages they enjoy, and to take care he property they are permitted so y to use. If we are right in this ction, it appears to some extent to be atter of education, and education in mon decency should be inculcated in schools.

The ictoria emorial

The practical completion of the Victoria Memorial by the placing of the large bronze groups over the side arches shows us the full zation of the sculptor's vision. We fraid the final verdict will be that whole design is overfeatured, and together with the varied scale of the es, must always detract from its ty. The memorial contains some admirable sculpture, but is lacking straint.

ictural ilations the ndon unty uncil.

The articles by Mr. Ewart Andrews, and letter by Mr. W. J. H. Leverton that we recently published, draw attention to the strength that is unquestionably added to the structural work by the concrete in which usually embedded to make it fire- ing. It is hardly conceivable that regulation of an up-to-date body like the L.C.C. should treat the concrete as so much dead weight instead of allowing for the greatly increased strength that experiments have proved it gives to the steel framing. As everything that is possible should now be done to bring down the present high cost of building it is imperative that the regulations should be revised.

Taxation of Land.

In the general expressions of relief that the first Budget of the Government should be so sound in its main outlines, the fact must not be lost sight of that it was made the medium for the announcement that a Bill would speedily follow having for its object the taxation of land in some form or other. With the experience as to the disastrous influence on building which was exercised by the last attempt at taxation of land values, and the loss to the community which resulted therefrom, the announcement that it is to be revived in any form gives ground for anxiety, and as the municipalities are to be encouraged in housing schemes there seems every reason to fear that it is private enterprise that will suffer from any renewed experiment in this direction. The Bill, which the Chancellor of the Exchequer has announced will make an early appearance, will be awaited with anxiety, and at present there is no indication of the lines upon which it will be framed. That it will not revive the preposterous principles of the Act of 1909-10, with its chimerical "site value," can only be assumed from the statement of Mr. Snowden that "it is to be well thought out and as simple as possible." No one could thus characterise the scheme of 1909-10, which resulted in confusion and cost to the private owner and little or no profit to the Exchequer.

Sir Aston Webb's Accident.

The uncertainties of life have been brought home to us very unpleasantly by the serious accident to Sir Aston Webb and other Academicians on Saturday night as they were returning from the Academy banquet. Fate has decreed disasters to many distinguished men in our streets, and often without any clear evidence of carelessness. The lives of respected and popular men are of much value to the community, and we have all reason to be grateful when, as we may happily foresee in this case, the distinguished victims are likely to make a good recovery. The services of Sir Aston Webb to the profession have been so great and varied that all of us join in hopes of a speedy recovery, and are glad to think that our hopes will be realised.

Ghadiali Pole, Baroda. (*See p.* 762,)

GENERAL NEWS

Professional Announcements.

Mr. J. H. Norris, Licentiate R.I.B.A., has taken into partnership Mr. L. H. Shattock, A.R.I.B.A. The business will be continued under the style of Norris & Shattock, at 51, High-street, Guildford, and 16, Church-street, Godalming.

Mr. G. H. Treacher has taken offices for private practice at Gresham House, 11, Warwick-street, Worthing.

Exhibition of Architecture at Wembley.

The exhibition of architecture now being arranged by the Royal Institute of British Architects and the Architecture Club, will be held in the galleries of the Palace of Art, British Empire Exhibition, Wembley, from May 26 to July 5. The exhibition will be opened by Lord Crawford at 3 p.m. on May 26, and will consist of photographs and models of the recent work of living architects in Great Britain and Ireland, India, and the Dominions.

Durham Architectural Society.

At the annual meeting of the Durham and Northumberland Archaeological and Architectural Society, held at Durham recently, the following officers were elected for the ensuing year: President, Mr. Hamilton Thompson, of Leeds; Vice-Presidents, Mr. Jos. Oswald and Mr. W. H. Wood, Newcastle; Hon. Secretary and Treasurer, Mr. J. Gradon, Durham. Mr. W. Richardson (Wallsend), Mr. H. S. Harrison (Durham), Mr. Pybus (Newcastle), and Mr. T. Lofthouse (Middlesbrough) were appointed to the Committee.

Architects' Benevolent Society.

The Annual General Meeting of subscribers and donors will be held in the Rooms of the Royal Institute of British Architects, 9, Conduit-street, W., on May 13. The President of the Society, Mr. J. Alfred Gotch, F.S.A., will take the chair at 5 p.m.

Architects' Assistants' Benevolent Fund.

The Architects' and Surveyors' Assistants' Professional Union has launched a benevolent fund for the benefit of its members and their dependents. The objects of the fund are: (i) temporary relief to members in cases of distress, illness, accident or sudden emergency; (ii) temporary loans to assist younger members in following up the profession; (iii) grants to widows and orphans; (iv) to acquire, endow or partially endow and maintain rest homes for members; (v) to secure for members any benefits obtainable from sanatoria, convalescent homes and similar institutions by the payment of subscription from the fund. Further particulars may be obtained from the Secretary of the Union, 36, Victoria-street, S.W.1.

COMPETITION NEWS

The Harrogate Infirmary.

The committee of Harrogate Infirmary invite designs for the extension of this Infirmary. Mr. Sydney D. Kitson, F.R.I.B.A., has been appointed assessor. Premiums of 150, 100, and 50 guineas will be awarded respectively. Applications, together with cheque for two guineas, should be made to Mr. Geo. Ballantyne, Secretary, The Infirmary, Harrogate, by May 31. Sending-in day September 30.

National Theatre.

The sending-in day for this competition has been changed from April 26 to May 15.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given):—Industrial Designs (June: Dec. 21, 1923). Ross-Smith Memorial (Sept. 30; Feb. 21). Glasgow Public Hall (July 4; May 2.)

CORRESPONDENCE

Royal Academy Drawings.

SIR,—"Confession is good for the soul," and one might be tempted to add that "criticism is the life blood of art." Pleading this excuse, I venture to draw attention to an illustration in your issue for May 2, taken from the R.A. Exhibition and entitled "A Project for a London Site."

In these days of discussions and articles on theory and composition of architecture, it is truly sad to find some of its leading exponents disobeying almost every article of their creed, and finding that the Academy, of course, must then go and hang the drawing.

I am perfectly willing to acknowledge my errors if it be proved to me that I am wrong, but the following points in this particular drawing seem to me to attract unfavourable notice:—

(1) Employing an order to the top story of a building, where it serves no purpose except as meaningless ornament or wall decoration.

(2) Unhappy fenestration, by the restless use of arch and lintol, to the top story. The general effect of this story, owing to its huge windows, being to crush down the rest of the building.

(3) Lack of emphasis to the main entrance.

(4) Skyline. The corners are obviously quarrelling with the dome. The one detracts from the other and the further addition of—presumably—two groups of sculpture, midway between dome and corners, irritates the eye with their fussiness.

(5) The lines of the centre pedimented block are not carried down below the second floor and the question immediately arises—whether the dome has any relation to the plan or not.

One might, of course, say that the corners represent projecting wings, the main body of the building being set back, with an arcaded wall represented by the lower order, leading to a forecourt. But does this even then justify the foregoing points? There is not even a shadow to indicate this conjecture, and shadows have been used on other parts of the design.

What is the good of exhibiting a drawing unless it expresses its motifs? It misleads instead of inspiring appreciation, and it certainly does not educate the public, who even yet have only a hazy idea of what architects are for. Their lack of interest in the "Mistress Art" is obvious, judging from the deserted state of the architectural room at the Royal Academy.

There is only one reason I can find for this drawing having been exhibited, and that is to show students what not to do. I have derived great use from it in illustrating its faults and possibilities to two of my pupils. Take the top story of the design by itself, fold the paper so that only the upper portion can be seen, and at once bar the ends with their hipped roofs, you have a delightful composition beautifully in scale; or, again, fold the sheet so that the drawing can only be seen from the first floor upwards. The first floor gives a solid base—if, of course, you eliminate the baroque swag ornaments—for the same top story, and the contrast of the two, still barring the hipped corners, is quite successful. Imagine, again, the restfulness of the skyline if you carried the hipped roof along the entire front and eliminated the dome.

Tolstoi said: "Art is a human activity, transmitting feelings," and it should devolve on the shoulders of our leaders to carry this out with a singleness of purpose that has only one end, namely, of making architecture symbolic of truth.

The hopes of the future are in the youth of to-day, and it is up to us all to maintain these ideals.

A. ARCHER-BETHAM.

Modern Swedish Architecture.

SIR,—May I call the attention of your readers to the very important exhibition of "Modern Swedish Architecture," which has been arranged by the Architectural Association, and for which the Council of the R.I.B.A. have kindly lent their galleries. The exhibition will be opened by the Swedish Minister, Baron Palmstie on Monday, the 12th inst., at 3 p.m.

The architects of Sweden have gone to siderable trouble and expense to prepare send the exhibition over to England, and hoped that the architects of England will s their appreciation by visiting the exhibi in large numbers. The exhibition consist drawings, photographs, and a number of mo all of which will not fail to arouse interest.

F. R. YERBURY.

South Moor Hospital Competition.

SIR,—I will not encroach upon your valu space by discoursing at length upon my into the wilds of Durham or on the qualit the roads in that wonderful county; but I w like, if you will allow me, to draw atten to one point, in connection with the a competition, which struck me very forcibl

I notice that according to the conditions down the cost of the building is not to ex £12,500. In order to bring their estim within that figure the authors of the t premiated designs base their estimate the cube figure of 1s., 1s. 3½d., and 1s. 6d. ft. cube. As the cost actually will in probability work out at nearer 1s. 9d. pe cube, this means that the cost of carrying these designs would work out at approxima £21,800, £17,300, and £14,500, or, in o words, 75 per cent., 38½ per cent., and 16½ cent., above the stipulated cost. In my opi all competitors who based their estimates figure lower than 1s. 6d. per ft. cube shoul disqualified, as it is otherwise hardly fai those who strictly adhered to the conditio

I may mention that I was not a competit the above competition, so that my remarks entirely disinterested. They are only mad order that in future all those who enter competitions may realise that, where any of cost is mentioned, it is only for amusem and no serious note need be taken of it.

"ANOTHER ARCHITECT

Unity and Registration.

SIR,—I should like to welcome the statesm like action of the R.I.B.A. Council in prod their excellent scheme for the fusion of R.I.B.A. and the Society of Architects.

The only hope of obtaining registrati to go to Parliament as a united profession.

It is obvious that one society representin profession is more likely to succeed than tw

Architects in most of the Dominions actually obtained registration, and surel of the mother country can get it too if we u

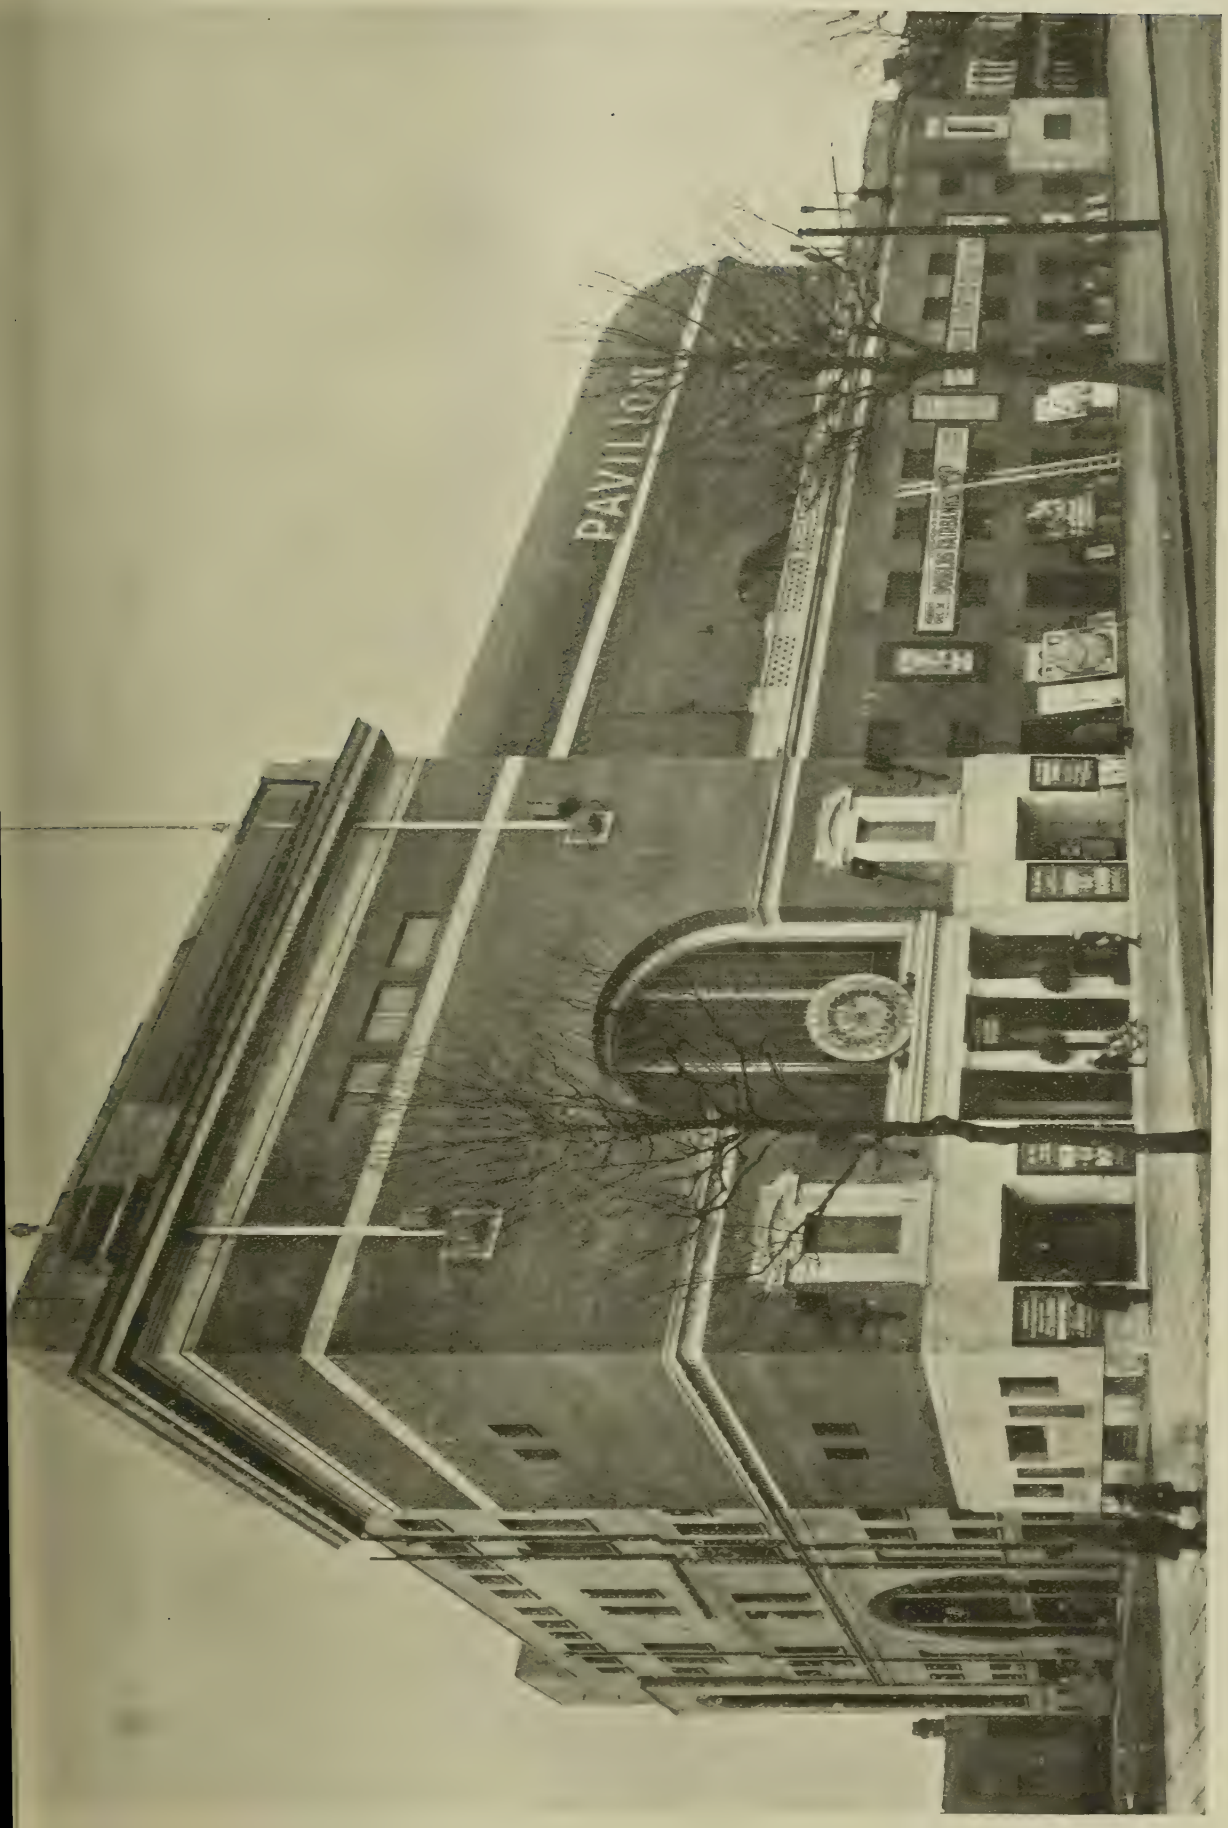
JOHN COLERIDGE, F.R.I.B.

The Institute Election.

SIR,—The importance of this election t Royal Institute cannot be over-estim Every member of the Institute should vot the questions for each are:—

Do I want Registration?

Do I want the Institute to be supreme



If the answer in both cases is, yes, th only one vote to give and it is for the list out by the Emergency Committee. The of the Defence League makes against b great profession and a great Institute.

There can be no doubt of this, they have in office and while there produced a Regist Bill which placed the Institute under the l a nondescript Board, and relegated it t position of a subservient Registry.

Let every member before voting exami respective list of supporters of the riva posals and ask himself whether the suggest the Defence League can be accepted, n that the great body of eminent men wh supporting the proposals of the Counc supporting a policy which is against th interest of the Institute and its mem Merely to ask such a question is to dismis preposterous. We want a great professio we want the Institute to be supreme.

There is only one policy which can a both ends, it is the policy of the Council sup by the Emergency Committee.

HARRY BAR

Shepherd's Bush Pavilion. Mr. F. T. Verity, F.R.I.B.A., Architect.

[Mr. Verity has been awarded the R.I.B.A. Street Architecture Medal, 1924, for this building.]

ARCHITECTURE AT THE ROYAL ACADEMY

In the long perspective of Academy exhibitions during some forty or fifty years past the general trend of criticism has, of course, varied greatly, but to-day, as yesterday, the thoughts of all those who are looking for the coming of beautiful buildings will still unite in some bond of sympathy whatever their personal predilections may be. It is surely right and wise for all architects to study contemporary work and get all the stimulus and encouragement they can from it, remembering that we are all built up of a variety of influences, many of which we are almost unconscious of.

Though the practice of architecture in recent years seems wanting in the vitality and movement which characterised the various revivals of the nineteenth century, there is perhaps more unity in thought and purpose and we may feel some encouragement in the thought that so far as town architecture is concerned we are likely to gain something in dignity and sobriety of effect. If pleasure buildings and business premises are lacking in gaiety and lightness, we can point to the gravity of jails, schoolhouses and town halls, with some satisfaction, even though it be somewhat grim. When we get a structure like that of Messrs. Selfridge's, so out standing in size and so clearly in view down the long perspective of Oxford-street, we may see some justification for its dignified and impressive treatment, and a long way further west we can still feel some genuine satisfaction for the equally bold and more English treatment of Waring & Gillow's fine block. But do not the cement fronts of Nash's buildings seem to us more closely in sympathy with their purpose in their simplicity and delicacy than the heavily-detailed stone frontages which are taking their place? The massive proportions of stonework strike one as going beyond their proper function as a mere dressing to the real construction behind. The finely-executed metal shop frontages in Berlin are surely nearer the mark than are most of our attempts at giving an appearance of solid stone construction to our steel-framed buildings.

One of the most interesting drawings is the sketch study (see our last issue) for a London building by Sir Edwin Lutyens. In this design we see how the natural instinct of one who has brought some real vitality into modern architecture enables him to achieve success by well studied outline and mass and by distinction of detail and to achieve variety and picturesqueness in a Renaissance street front just as he has done in some of his best country houses. His "Castle Drogo," 1185 and 1188, will probably be a notable place, but he has chosen to illustrate it by mere silhouette drawings, which show a curious and singularly unattractive sky-line. Reverting to business premises, we have the President's agreeable frontage (1276) to Nos. 36–44, Moorgate (which we illustrated last week), in which a narrow front is skilfully handled; Oxford-street premises by Messrs. Gibson & Gordon (1236), with a telling pavilion treatment; P. & O. Offices (1223), by Messrs. Collcutt & Hamp, a well-balanced front; a design for the Holt Building, by Mr. Curtis Green (1222) a frontage of distinction just lacking the cohesion that would have completed its value; Sir Reginald Blomfield's Centre Bay at Barker's (1211), an interesting detailed drawing governing a good Renaissance treatment; office building, by Oswald P. Milne and Paul Phipps (1213), suggesting some good grouping of features; rebuilding of 58–60, Charing Cross (1224), by Messrs. Hayward & Maynard, a good design, though it is a little out in scale perhaps; new premises, Jermyn-street (1229), by W. Thrale-Jell, a quiet broad treatment of a simplicity we should like more of; a detail drawing of insurance offices (1333), by Prof. Beresford Pite, showing his skill and invention to a degree that somewhat mars the breadth; a telling mass of the Hudson Bay offices' entrance, by Messrs. Mewes & Davis, which shows a fine pillared entrance way; the colliery offices (1342), by A. Gilbert Scott, which promises to be a very pleasing building with good proportion and telling breadth; three of the Empire Exhibition pavilions, the *Times* building, by Oswald P. Milne and Paul Phipps (1302), an interesting design, the all metal Pavilion (1308), by W. D. Sinclair, and the Food Pavilion (1209), by Ed. Maufe.

Amongst the works which serve as factors in our hopes for modern architecture we count on such things as the Churches, by Walter Tapper (1252) and G. Gilbert Scott (1246); the Cottage Hospital, Weybridge (1289), by Kenyon & Lavock; the Deal Hospital (1292), by Messrs. Adams, Holden & Pearson; admirable work by Messrs. Walter Brierley & Rutherford, and other houses at Cowfold (1165); Ed. Maufe's little bank at Amesbury (1199); A. G. R. Mackenzie's pavilion at Bournemouth (1277) and the able scheme for the Raffles College (1288), by Messrs. Farey & Graham R. Dawbarn; the Cairo Hospital Medical School, by Nicholas and Dixon Spain; the business premises (1195), by Oliver Hill; and the Vigo House (1192), by Sir J. Burnet and Partners.

But even the best of the subjects in the Academy leave us with a feeling of uncertainty as to what architects are really aiming at. We certainly can discover some more definite ground when we come to domestic work, to hospitals, or the best of our church work, but architects cannot apparently control the shopkeeper, enthuse our public bodies with high aspirations, or yet give a definitely logical expression to modern forms of construction. Why is this, with so many able architects amongst us? Our hopes must lie largely in the future and we must try to co-ordinate the forces of education in some way so that we may neither suffer for the lack of sound teaching on the one hand or the vivifying influence of personal influence from our best architects on the other hand. Mr. Bodley once told us that he felt at a loss to convey to students at the Academy the real why and wherefore of his own designs, though he quite agreed with us as to that being the thing they all wanted to know. Courage, conviction and concentration, modified by a divine discontent, may form a panacea for our needs.

Following the order of the catalogue, we will now refer to other subjects not already noted. The "House near Warwick" (1155), by P. D. Hepworth, has a definite distinction by the nice emphasis of parts: the slight entrance projection carved up to the eaves gives an agreeable note of interest flanked by plain walling and the design is very nicely presented. A comfortable-looking house at Hampstead Garden Suburb (1157) is by C. M. Hennell and C. H. James; and another good design of similar Georgian type (1161) is here, by Lowry and Woodhouse, this latter one illustrating the value of a high-pitched roof. The bank premises for Welwyn (1163) by Louis de Soissons, indicates the value to be obtained by pleasant proportion. The admirable low-proportioned house (1165), by Brierley & Rutherford, we have referred to before. A somewhat unusual and pleasing effect of solids and voids is to be noted in "Lordship's Close" (1168), by W. J. Kieffer. An excellent small house design is "Appleshaw" (1167)—a good plan and nicely balanced elevation—by Ernest Allen & Partners. One of Mr. Guy Dawber's nicest houses is that at Queen Camel (1172). "The Churchill Rectory" (1173), by Knapp-Fisher, Powell & Russell, is especially pleasing, both a subject and an unusually nice drawing, the character of which we should like to see more followed: sincere, simple work like this is far better than the quantity of theatrical self-conscious drawing we see so much of now. The two subjects in one frame—against R.A. regulations!—(1177), by Oliver Hill, are good, sound work. "The Round House" (1178), by Cooke & Harrison, is a clever piece of planning and may make a good result; there arise many useful corners on such a plan, but the various rooms need very careful treatment to achieve success; the exterior is not quite so effective as the plan would suggest of possibilities. A thoroughly old-world air hangs over the house, "Hilles" (1184), by Detmar Blow: it is an agreeable, picturesque design of good balance, and owes something to a pleasant sympathetic representation. "North Munstead" (1189), by Harold Falkner, has a sturdy vigour, telling pourtrayed. The "Vigo House" (1192), by Sir J. J. Burnet & Partners, promises to be a good street frontage, though one might hope will not run to the cost of the flanking dom A sweet Gloster building is "Warneford Hou (1194), by Andrew N. Prentice. Of war memo als we have here two—the Cape Helles (1196), Sir J. Burnet & Partners, and that at Aberde (1201), by A. M. & A. G. R. Mackenzie—bo have pronounced excellencies. Mr. Herb Baker's "Garden Court Bank of England" (12 is so illustrated that it is difficult to form estimate of its promise; the drawbacks of design may be more apparent than real, and actuality we may find rhythm, refinement a dignity. The Hudson's Bay Co. new offices are have a fine pillared entrance through the fr block to St. Helen's-place by Mewès Davis Allom (1209). It seems a pity that so lon frontage as the Gramophone Factory Offi (1210), by Wallis Gilbert & Partners, was treated with less monotony.

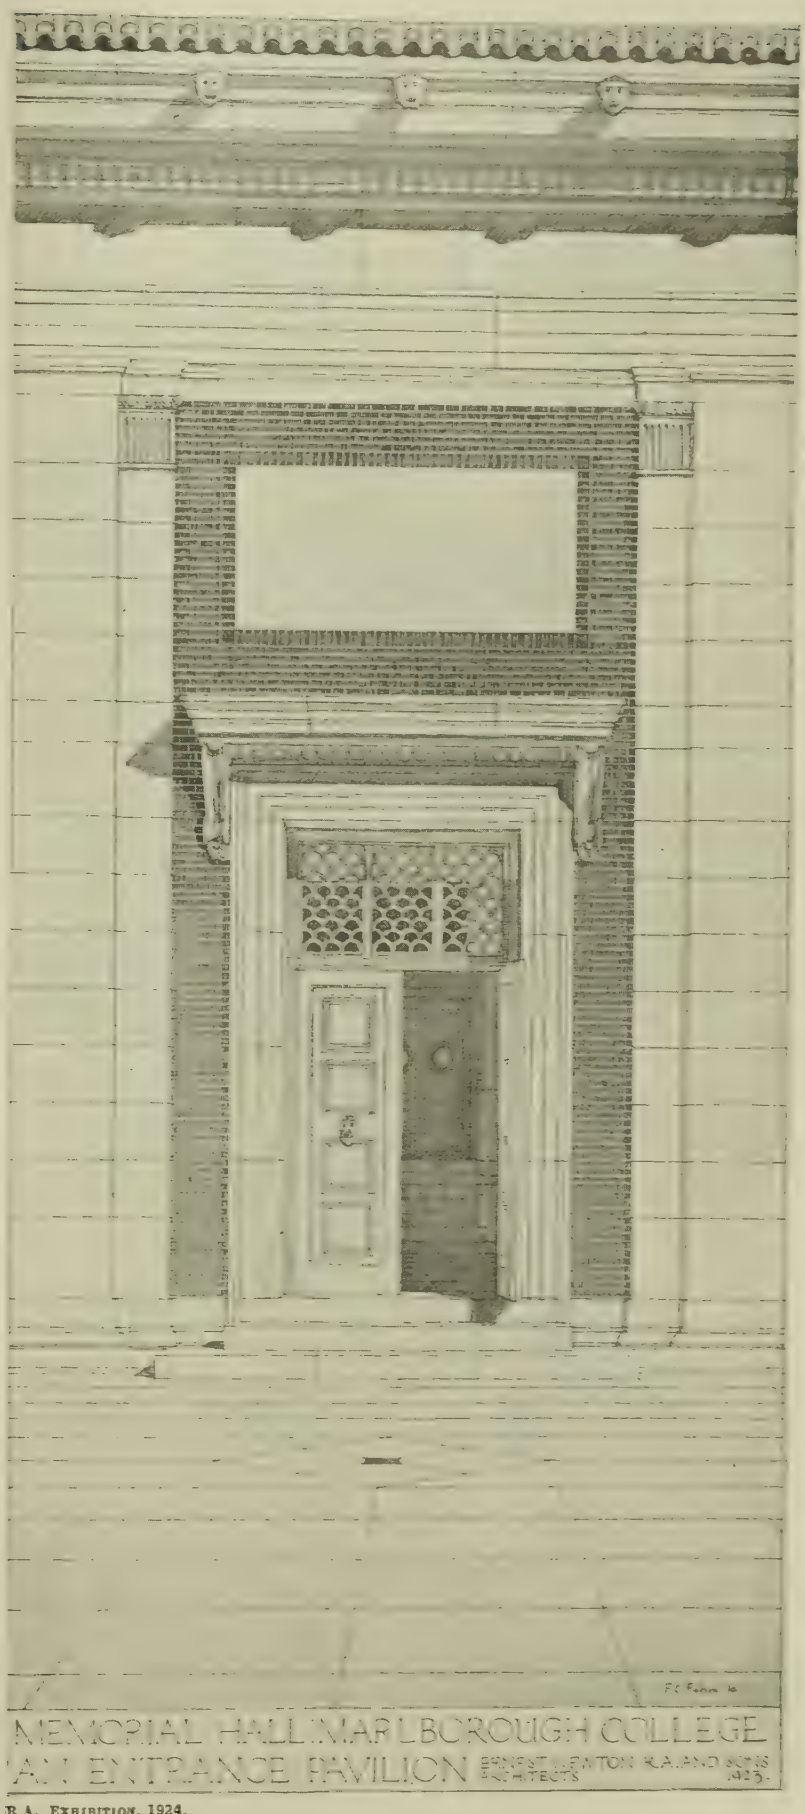
Sir Reginald Blomfield has a good de drawing of Barker's new premises (1211), wh shows skill and refinement of handling. new Library for Exeter (1212) is not very co prehensible in the drawing by its archit Sidney K. Greenslade. It is very like in char ter to his Welsh Museum. A somewhat fr treatment of an office building (1213), by Osw P. Milne & Paul Phipps, is somewhat awkwar illustrated. The Morgan Greenfell Bank (1 is a nice, refined piece of Renaissance work Mewes & Davis. An original and telling ef is the brick wall with a steep-pitched w gabled porch in the centre forming the f to the "Masonic Hall, Stroud," Falconer, Baker & Campbell. This draw suggests an interesting Continental tit the object of the front of the building wo appear to be the effective setting of the entra which is certainly fully accomplished.

The new P. & O. Offices (1223), by Collcu Hamp, is far removed from Collcuttian tin it promises a well-balanced dignified build with a touch of Greek feeling, but there some who are more pleased with designs like Wakefield Town Hall. The cinema is st prominent feature with us to-day, and prob will outlast the skating rink craze; among better treatments of it is that in Kensin Road (1226), by Messrs. Granger & Leathart Dixon-Spain touches with interest all subjects, and a very pleasing treatment be noted in the Mosque from Cairo (1227 Messrs. Nicholas & Dixon-Spain. A compet design of quality is that for the Greenwich F (1228), very well presented in elevation and by Horace Field and Dighton Pearson. new building for the Society of Friends (123 Mr. Hubert Lidbetter seems just a little staid even for the Friends.

The able design for Cairo Hospital (1238 Lanchester Lucas & Lodge, is unfortuna the effect the bird's eye view gives of a cro congestion of the wards.

At this point on the walls interest reach active stage, for we have two admirable chu entered by Walter Tapper and Geo. G Scott (1243 and 1246); a good east end, ney Church, by H. P. Burke-Downing; V Caroe's big church of St. Helens (1244); excellent new meeting room of the R.I by Arthur Keen (1242), and well consi subjects by Austen Hall (1241), and Richa & Gill (1247)—a frankly modern ware buildings in Gresham Street. Then we hav impression of a restored Scotch Abbey Ch which we really find to be an excellent of Gothic by Brierley & Rutherford, a Mer Chapel for Durham School (1249): is no strongly marked horizontal crowning the a little hard on the pointed arches? The grouped block of Record Office (1253 Francis Troup; the very satisfactory Memorial for Birkenhead (1255), by Budden; the vigorous design for Church, H

(1256), by Edward Maufe; the very success-
War tablet (1257), by Major Lafontaine and
ginald Hallward; and a good church, by
lip J. Marvin (1261), are all noticeable things.
e latter church shows the value of a good
se of scale in design.



A pleasant little subject is the chapel at
Brabanconne (1265), by one whose hand has
lost its cunning, Leonard Stokes, and
rsdale. Some good decorative work in glass
mosaic appears on the walls, including
able mosaic designs by R. Anning Bell, and
should not overlook the rich delicacy of
et in the casket for "Tee H" (1263) by
e Smithers.

The Bath Abbey Memorial Chapel Altar (1268),
Sir T. G. Jackson, has a somewhat attenuated
k if it is in stone. Sir Thos. has a nice little
morial chapel at Stapleford Church (1282).
he illustrations are given of the large school
g built at Ballards by Sir Aston Webb &
(1272 and 1273), the quality of which was
er seen in last year's Academy. We are glad
note the partnership of Forsyth and Maule
work again at Stow (1279) and Bath (1281).
he characteristic work by H. Percy Adams,
den & Pearson, is seen in the Westminster
pital alterations (1287). The Harrogate
(1303), by Messrs. Farey, Simmons &
ards, is a pleasing piece of simply designed
k. The Plaza Theatre, Piccadilly Circus
1), by F. T. Verity, has some freshness of
rest, but we feel that it would almost gain by
omission of the dome. An excellent piece of
lo-Chinese design is the China University
eway (1343), by Fred Rowntree & Sons: the
bination of the steadiness of line with the
ese picturesqueness is very happy. One
ld not overlook a very well-designed little
age at Hornchurch (1329), by A. Edgar
sford. Decorative designs by Martin
rers (1344 and 1347); and a processional cross
Walter Stoye (1337) about exhaust our list
notes, which we do not pretend cover all
well-trodden ground of the architects'
way. We can hardly call it one of the
biest years for stimulus and encouragement
we feel sure architects would do better i,
were less inclined to do always as others do

"A GLORIOUS TRADITION"

a recent lecture of this session's course on

es of decoration. Meanwhile, in north-
Europe architecture of line and form re-
l of more value than architecture of colour,
as perhaps in better accord with the cold
f their English climate.

R.A. Exhibition, 1924.

Mr. William G. Newton, M.A., A.R.I.B.A., Architect.

PAINTING AT THE ROYAL ACADEMY

GENERALLY speaking, the exhibition of some 859 pictures (excluding miniatures and etchings, &c.) at the Royal Academy of 1924 will be found interesting by those who are students of the various styles of painting. The British school of painting is full of clever executive ability. Of that there can be no doubt at all. The artist to-day has learned his or her trade as a painter. What is the next step? Dexterity in painting counts for little if it is not supported by stimulating intelligence. On one of the initial pages of the Academy catalogue a quotation from Sir Joshua Reynolds, P.R.A., states that, "The great end of art is to strike the imagination." In other words the genuine aim of art is to lift one's thoughts into a higher spiritual plane, to transcend the material environment of everyday life. The writer of poetry, through the abstract suggestion of words, can almost immediately convey the reader's mind into an interesting atmosphere created by the poet; the painter's work is more laborious, with the more difficult problem of inducing the spectator to get behind, as it were, the surface of paint (as applied to canvas or paper) so as to comprehend the message of the artist to the outside world.

It is therefore of every importance that the means or manner of a painting should in no way interfere with the end in view, *i.e.*, the sentiment of the picture. Mr. George Clausen is entirely successful in this respect in his two landscapes. The artist has sought to express the intensity of his emotion in plain, simple language. It is only a master that can eliminate so much of Nature's detailed forms and yet retain the suggestion of detailed information. Mr. Clausen has something to say in art, and his sincerity, luckily for those who appreciate his work, prevents him from using glib passages of paint. Every picture that he exhibits shows evidences of profound thought and much artistic wisdom. He has no rival either here or abroad for producing brilliant sunlight effects in early morning landscape subjects, wherein the dazzling and luminous rays of the sun are felt even in the reflected glow in the shadows.

Mr. Philpot's picture, "The Resting Acrobats," is much to be commended. To begin with, the colour is beautiful, the tones are accurately rendered, and the drawing excellent. Last, but by no means least, the artist has produced an atmosphere of realism to the well-rendered performers that is not always associated with his paintings. It is one thing for the public viewing the activities of acrobats in a travelling circus and enjoying maybe the apparently light-hearted and smiling mien of the performers when in the ring, but it is quite another affair to know and understand these people in their home life, with all the hardships that circus life entails. The physical exhaustion of the woman is pitiable, whilst the devotion of the emaciated-looking boy hugging a pet monkey gives the essence of a dramatic human touch.

"A River in France," by Philip Connard (No. 22), possesses a gaiety that is peculiarly Mr. Connard's own style of expressing himself in paint. The picture abounds in a healthy vitality and is an easily rendered landscape, combined with various figures grouped at different intervals.

The best portrait in the whole exhibition is Mr. Sargent's "Sir Philip Sassoon, Bart." It is a marvellous piece of work showing the accumulated knowledge of artistic experience. There is no bravado in the way of sweeping brushwork or accidental qualities often associated with modern oil painting. The constructional power of the head, the poise of the body, and the masterly left hand low down in the picture are rendered in the manner of a consummate master.

In Gallery No. II there is a decorative panel picture by Mr. de Glehn (No. 67), entitled "Leda." An elegant nude figure is depicted bathed in luminous sunlight, and the delicacy of the subtle warm and cool greys is a testimony to the ability of the painter. In the same gallery Mr. de Glehn's picture "On the Cliff, Cornwall," has all the spontaneous charm and illusion of a vigorous sketch done directly from Nature. Sir William Orpen's picture of "The Viscount Milner" (No. 110) is a worthy representation of this artist's undeniable skill in portraiture.

Of the two still-life paintings by Mr. H. Davis-Richter, the one entitled "Ecstasy" (No. 131) has the greater artistic appeal. The rich tones of the background help to enhance the decorative qualities of the superbly-painted flowers. Mr. Davis-Richter knows, too, how to select a frame that has some definite association with the enclosed picture. Mr. Richard Jack has an outstanding painting of Miss Doris Jack (No. 135), in which his deft arrangement of a black mantilla shawl is admirably manipulated so as to give piquant contrast to the full length figure. The light touches of gold on the brownish coloured dress are very well rendered.

Mr. Charles Sims's large portrait of "H.M. The King" naturally occupies the place of honour in No. III Gallery. There is no doubt that it is a very fine painting indeed, and that Mr. Sims has risen well to the occasion, not having lost his inimitable charm of colour harmonies, of which there is some danger when portraying the reds that are inevitably associated with regal costumes. The only portion of this remarkable picture that calls for criticism is the triangular position of the legs. There is a lack of stability in design here that is not altogether pleasing.

Mr. L. Campbell Taylor's picture, entitled "The Corridor" (No. 175), conveys a sense of security and rest not always attainable in modern artists' paintings. The delicately-toned walls of the corridor, painted with such deliciously cool tints, are a perfect setting to the well-drawn figures grouped together in the more distant part of the picture; the whole result produces a philosophic content and real æsthetic beauty, somewhat reminiscent of the Dutch School of Painting, but the personality of the artist is none the less evident throughout the whole picture.

Mr. Arnesly Brown is very convincing in his three landscapes, each of which is painted with that sureness of handling that has so long distinguished Mr. Brown's work. Of recent years his pictures show a marked tendency towards thoughtful and concentrated pattern, and the pictures have consequently gained in artistic value. An artist like Mr. Arnesly Brown, who has had so much experience of studying Nature in her different moods and in observing her unlimited opportunities of detailed forms, has more to say in painting when he undertakes to subordinate his subject to a coherent design than a painter who is not so familiar with Nature. Mature knowledge of Nature peculiar to landscape life is a great asset to an artist, who is then able to leave out or put in detailed shapes, just as much or as little as is demanded by the subject in hand. There is little to choose in Mr. Brown's three landscapes, although No. 188, "The Sunny and Silver Trent," in Gallery No. III, is the most important in its dimensions.

Congratulations are due to Mr. Sidney Lee, who is making such good progress with his landscapes in oil. Two of his paintings face each other in the large Gallery. "The Top of the Pass" (No. 151) is remarkable for its fine tone values and sparkling effects of light, coloured rocks or stones peeping out in places through the warm-coloured verdure in the foreground. The other painting, entitled "Amongst the Dolomites" (No. 192), shows a wealth of brilliant colouring of these fascinating mountains, combined with Mr. Lee's reputation for logical knowledge appertaining to rock strata. His two pictures of Venice are well worth studying for his original conception in treating Venetian subjects. In his picture of "Sunset: The Rice Harvest in Izumo, Japan," Sir H. Hughes-Stanton departs from his customary colour scheme of restrained hues to one of lighter and much brighter colours. The result is a pleas ambient effect, suggestive of sunset co effects.

Mr. William Rothenstein and Miss Anni Swynnerton each have a picture in No. Gallery which have been purchased by President and Council of the Royal Acad under the terms of the Chantrey Bequest. of these pictures were painted some years and have been exhibited before.

Not very well hung, but excellently pai Miss Beatrice How's picture, entitled Brittany" (No. 262) has a suggestive style. means employed are very slight, but the cha terisation of the woman and baby are masterly. An adjoining picture, "The Tha from My Studio Roof," by Mr. J. G. M depicts the artist's skill in painting the effe brilliant sunlight on water. There are pictures of Mr. Alfred J. Munnings that cal particular mention. One is "Rosemary Eddie de Rothschild" (No. 276), the othe "The White Canoe" (No. 318). In the fo subject two children are riding ponies wit easy grace, the figures and ponies being houetted against a blue sea of unusual freshn There is an air of spontaneity throughout whole picture, with the added charm of lo colour. The second subject, depicting ladies in a canoe, is admirable for the exacti of restrained tones of the flesh tints, hats, w and foliage beyond. It has one serious d back—the trees and bush forms should been painted with more serious attentio structural growth, so as to make their ap ance more acceptable in the general design o picture.

Mr. Harry van der Weyden's picture, " Tide," is a genuine representation of theshin of moonlight on the muddy banks and wat a tidal river. The effect is poetical and tho ful from the standpoint of sentiment, w another painting, entitled "The Christch Bend," by Miss Emily Court, is full of the he vigour of life, wherein boats, water, sky, &c., help to illustrate the fact that Miss essayed, and successfully, to give the appea of a fresh breeze blowing throughout the sul

"Epping Forest" and "A Surrey Landsc both by Mr. Richard Jack, are rather surpr The Surrey landscape is immeasurably su to Epping Forest. The Forest subject is in execution, whereas the other picture is good; the deep tones of the trees immedi above the cottages are rich and sonorous help to give the sky much luminosity, n through force of contrast.

Miss Amy K. Browning has a ma painting of a girl and dog entitled "Love (No. 339), which would have looked better if not hung quite so high up. M Vicat-Cole has a picture in the same ga although not so good as last year it has m it that is worthy of close attention. The "Old Bridge at Yiewsley" (No. 356), is t of the subject with its attendant barges. tone and colour of the bridge is good, two or three trees on the extreme right-han of the picture are quite classical in form clouds also are painted with due rega structural form.

Mr. Terrick Williams's picture, "Quiet ing, Honfleur," is one of the best things thi has given us. Of excellent design, sup by low-toned colour effects, the correspo result is stately and dignified. The count of Mr. Williams's impressive work is s Mr. Charles Simpson's painting, "The E Season" (No. 403). It is a powerfully-h canvas depicting many fisher-folk packin conveying fish along the quay-side for purposes. The feeling of diffused su intermixed with men, women and houses only have been achieved by serious study spot, supported by keen observation part of the artist.

The best picture sent in this year's Ac from Mr. Algernon Talmage is undou "The Waning Moon" (No. 530). Mr. T is always to be relied upon to give us goo values in his landscape paintings, but wh is allied to something of desirable interes as a moonlight subject, then one can æsthetic pleasure from his work. A

-painting of "Haystacks," by Mr. D. Murray nith (No. 560), sparkles with the vibration used by broken paint, textures and luminous louring matter. A joyous little picture!

An artist with modern tendencies, Mr. A. aker Clack, exhibits two pictures in Gallery o. X. Their respective titles are "In Pro-nce" (No. 604) and "Trépied par Etaples" o. 597). Of the two the latter subject is e better. The tonal values of this picture are nsistently well managed, and convey the ence of warm sunlight without any conven-nal struggling to express it. There is a tain whimsical charm in "Portrait with imroses," by Norah Neilson-Gray. The ure is well placed on the canvas with the ater weight of the costume appropriately ced in the lower part of the picture, thus ring stability and support to the rest. The imroses are delightfully painted, those in adow being rendered with luscious trans-rency.

The manner in which the water-colour room hung is pleasing and effective. It contains really fine painting by Mr. L. Lee Hankey itled "Slumber" (No. 713). A girl in bed, h a patch-work quilt resting in a negligent nner on the bed, is painted in beautifully nned water-colour washes of delicate hues, ggesting all manner of details without actually pressing them. The picture is tuned up to acert pitch through the introduction of a touches of bright colours on the quilt, trasting with the pearly greys generally ead over the greater portion of the picture.

Mr. Walter H. Allcott wisely chose a paper h an interesting granulated surface when he nted "Siena: Morning" (No. 781). The rkmanship is scholarly throughout, and the ing of early morning light is truthful to ture's conception of it. Another water our of charming, simple colour expressed flat washes, of "Amberley Bridge," by George S. Ingles, is worthy of attention; (No. 801), "The Little Viaduct," by A. R. Middleton-Todd.

Mr. W. Russell Flint (recently elected as Associate of the Royal Academy) is seen to h advantage in "The Harvesters, Aragon," also in his oil-painting, "The Lemnians" . 361). The latter picture is somewhat lar to the oil-painting he exhibited in last 's Academy. The result is better in this ure; the drawing and modelling of the semi-es show controlled skill, and the pattern rally is ably arranged, the deeper-toned urs make a good setting to the lighter tints.

The Nativity," a large water-colour by Miss thy Hawkesley (No. 816), is painted in the known style of flat pattern decoration, cal of this clever artist, and the picture led "Vista in the Queen's Dolls' House," Mr. A. Van Anrooy (No. 826) is a remarkable evement of scientific detail being carefully essed without any loss of artistic impulse.

Obituary.

. C. W. Denny, who passed away after a illness on May 1, was well known in the ing industry in London as a clerk of works, had acted in that capacity on many im-nt contracts. Until recently he occupied osition of secretary of the Incorporated s of Works' Association, and the esteem in h he was held by the members of that body hown at a presentation held six weeks ago. response from all parts of Great Britain to ppeal of the organisers of the presentation tribute which could have been made only capable and loyal official. The late Mr. y was a versatile man. As a clerk of works ined the respect of all with whom he came ontact, and as a teacher of building sub-he did good service for the Surrey, Kent, esex, and London County Councils. He keen photographer and horticulturist, and earlier years he was prominent as an an and cyclist.

Thomas Jenkinson, of Annesley House, house-lane, died recently at Bentley. He ounder of the firm of builders and con-rs, known as Messrs. T. Jenkinson & Sons.

Mr. J. Alfred Gotch (President) occupied the chair at the annual dinner of the Royal Institute of British Architects at the Trocadero Restaurant, Piccadilly, on Tuesday evening. Amongst a distinguished gathering om members and guests were Lord Charnwood, the Earl of Midleton, the Marquess of Northampton, Lord Olivier, Lord Sumner, Lord Thomson, Professor Patrick Abercrombie, Mr. Maurice B. Adams, Sir Ryland Adkins, Mr. Henry V. Ashley, Alderman Alfred Baker, Major Harry Barnes, Mr. Thomas Barron, Sir James Bird, Dr. W. A. Blackstone, Mr. Edward T. Boardman, Mr. H. Chalton Bradshaw, Mr. Walter H. Brierley, Mr. H. W. Brittan, Mr. Herbert T. Buckland, Sir John J. Burnet, Mr. C. McArthur Butler, Sir A. R. de Capell-Brooke, Mr. D. Y. Cameron, Mr. Walter Cave, Mr. Basil Champneys, Major Hubert C. Corlette, Mr. E. Guy Dawber, Mr. Reid Dick, Mr. Rudolf Dircks, Mr. J. Murray Easton, Sir Banister F. Fletcher, Mr. Henry M. Fletcher, Sir George Frampton, Mr. Percival M. Fraser, Mr. Hastwell Grayson, Mr. W. Curtis Green, Mr. W. H. Gunton, Mr. E. Stanley Hall, Mr. Stanley Hamp, Mr. Everard J. Haynes, Mr. Henry T. Holloway, Mr. P. W. Hubbard, the Right Hon. F. W. Jowett, Mr. Arthur Keen, Mr. G. C. Lawrence, Sir Walter Lawrence, the Bishop of London, Mr. Ian MacAlister, Lt.-Col. Stuart Mallinson, Mr. H. Matthews, Mr. Fred May, Dr. J. S. Maynard, Mr. Percy W. Meredith, Mr. Thomas R. Milburn, Mr. Gerald Moira, Mr. Alan E. Munby, Mr. John Murray, Mr. William G. Newton, Mr. E. J. Partridge, Mr. Henry Poole, Mr. G. P. Powis, Sir Humphry Rolleston, Dr. Alexander Russell, Mr. Henry A. Saul, Sir Amherst Selby-Bigge, Sir Cecil Harcourt Smith, Mr. J. C. Squire, Mr. T. S. Tait, Mr. Walter Tapper, Mr. Sydney Tatchell, Mr. Percy E. Thomas, Mr. Raymond Unwin, Mr. C. F. A. Voysey, Mr. A. B. Walkley, Major F. A. Wallis, Mr. Edward Warren, Mr. Paul Waterhouse, Sir Lawrence Weaver, Mr. Maurice E. Webb, Mr. Herbert A. Welch, Mr. William Woodward, Mr. F. R. Yerbury.

After the loyal toasts had been proposed by the President and enthusiastically honoured, Sir Amherst Selby-Bigge proposed "The Royal Institute of British Architects," and referred to the Ethiopians and Cyclopeans. The Cyclopeans were individualists; they did not care what anyone else did. But since the days of the Cyclopeans the architects had learnt a great deal, and that there was a great deal to be learnt. They realised that it did not do not to care what other architects were doing or not doing. Architecture was a high art; it did not call down automatically the Promethean fire of inspiration. In the sphere of education for art they were up against great difficulties: more difficult than in any other sphere of education. A system of education must have room for the free development of the talent of the individual—not the talent of the genius—genius the incorrigible. But genius was not condemned to futility; it was a question of keeping the heads of genius among the stars, and at the same time to keep their feet on the ground. The Royal Institute of British Architects was a great organisation—a great professional organisation. He owed a great obligation to the Institute, and institutes of a similar character.

The President, in responding, said that on behalf of the Institute he thanked Sir Amherst Selby-Bigge for the interesting manner in which he had proposed their health. He did not propose to follow him very closely in what he had said because he thought they would perhaps be pleased to be taken away from the ordinary atmosphere which pervaded the Institute. He would, therefore, content himself in welcoming so many distinguished guests who were interested in architecture, for the greater the number of those other than architects who were imbued with an interest in architecture, and could look at the art with discerning eyes the better it would be for the public and the better for architecture. When they reflected upon the arts, it was obvious that architecture was the most obvious; it was the most visible, intruding itself in the most insistent way on the consciousness of the world at large. It was desirable that the public should have some knowledge of the principles underlying it—its external expressions needed no urging. Perhaps one reason for the lack of knowledge might in part arise from the fact that architecture had played no great part in literature. No poet of the past had sung its glories, its splendours. No prose writer, not even Ruskin, had taken it as his theme in a manner so attractive and so well informed as to be both fascinating and truly educational. The reason was not far to seek. No poet, no prose writer, had really interested himself in architecture. Inspiration might give a delightful faculty of expression, but it would not give a knowledge of the intricacies underlying the visible manifestations of architecture. The subject was not an easy one. He could imagine a poet struggling for months to master his subject sufficiently to start upon his epic and finally bursting into only petulant song. But while they searched the pages of the poets in vain for rhapsodies upon their art, they would find allusions to it. Chaucer, for instance, gave a mental picture of a mediæval hall. Spenser was rather more particular, and brought before the eye some of the glorious palaces of the Elizabethan day. The embodiments of architecture, so far as they came within their ken, continually appealed to poets. Shakespeare had many allusions to it. Milton, too, had a few slight pictures of buildings as he saw them. Pope had some entertaining references to architecture, but it was more in the way of satire. Gray's familiar lines aptly illustrated the interior of an Elizabethan house. Coleridge also referred to architecture. Many other poets might be quoted as describing what they saw, although without really understanding it. Perhaps Browning burrowed deeper than the rest. One school of philosophers said that the Gothic arcade derived its form from the grove of trees, which was converting a charming fancy into matter-of-fact nonsense. Another school of philosophers said that while Greek architects placed their columns outside their buildings, Gothic architects placed them inside for a change. There was no abiding epic on architecture in the field of poetry or prose, and if any enterprising poet would deal with architecture in an epic it might convert architecture into something palpitating with warmth and colour.

Mr. E. Bertram Kirby, further responding, said the Liverpool Architectural Society was senior to any other architectural society in this country with the exception of the Royal Institute. Their close alliance was of great value; its significance might easily be lost. Only a few years ago the union between them was by no means so cordial as to-day. A short time back the alliance might have been considered a generous experiment. However, it had now attained to the dignity of a permanent union. He would also like to mention that in his Society, excluding students, two-thirds of its members, and, for the first time in its history, the Council, were members of the Institute. There was a great advantage from this close co-operation and alliance. It was not an exaggeration to say that its pres-

tige would not be what it was to-day without the allied societies. Together they formed a body which was of Imperial significance. It promised to be even larger in its scope than at present. He would express to Sir Amherst Selby-Bigge the thanks of the allied societies for the toast he had proposed, and to the manner in which the President had responded.

The toast of "The Arts" was proposed by the Vice-Chancellor of the University of Oxford, who, after expressing his sympathy with Sir Aston Webb in the accident which had prevented him from being present that evening, said he thought there was no time when art was more needed. It was not easy to forget the hideous buildings erected when they had to approach London through miles and miles of ugly houses. Especially did they need a knowledge of the arts when it was proposed to destroy some of the remaining Wren churches in the City of London; everyone who really represented the arts, or was keen on the arts, would wish that the hands of the destroyer would be spared and that those masterpieces would not be confiscated. Was there not a real need for the teaching of the arts when they remembered the great tendency to practise and preach the cult of the ugly? A great deal of modern art had cast away all tradition and made up for its lack of originality by departing from the traditions of those who made beauty in the old days. Sir Amherst Selby-Bigge had said that heresies of one generation were the orthodoxies of another; sometimes that was so, but he thought in the majority of cases the heretics who had become orthodox were very few indeed. Occasionally a person who made a departure went right, but the majority went all wrong. Those who made new departures which were successful were those who kept some traces of the old traditions. He was glad to know that art was now taking some part in the teaching of the children of the masses.

In responding, the Earl of Midleton said he was once President of the Union of Oxford, and the first time he met Mr. Waterhouse when engaged on work at Oxford the Committee differed with their architect on every point. In the chaotic times that existed nowadays it was comfort to go with the architects where the flowing tide was with them. It was surely a truism that art of the higher nature was swamped by mechanical art. He could not help thinking of the remarks Lord Beaconsfield made in regard to the aspirations of his party some eighty years ago: "He did not think that the country had done anything for the people; in place of the monastery it had given the workhouse." Within two miles of this neighbourhood they could see the three most monstrous buildings erected in London. For instance, they had the Albert Memorial; sandwiched in between the Houses of Parliament and Waterloo Bridge they had Charing Cross Bridge; then they had the Griffin as a substitute for Temple Bar. It was a tradition at the War Office that the Duke of Wellington, when asked if the architect of certain new barracks should have his name embossed on the building, refused, saying that punishment should be meted out according to the offence! Reverting to commercial art, it had done something for the higher forms of art which had never been achieved before. It enabled people to see works of art which would otherwise have been impossible.

Mr. J. C. Squire, who also responded, said the art of being President of the Royal Institute had been raised in late years to a fine art—Mr. Paul Waterhouse instituted a magnificent tradition, and that was being carried on with equal success by Mr. Gotch. The art of being Bishop of London was also flourishing, for he believed no man had done more to make opportunities for contemporary architecture. He believed the chief thing about the arts in the present day was that they had come out to the arena. In the Victorian age there were those who protested against the ugliness of the age and those who spent their time taking refuge from it. It was not a good thing to take refuge from surroundings, and it was good to know that the arts were now coming into the arena and getting into touch with the public, and attempting to do what the public wanted; that was sufficient to justify them in thinking that the arts were now more flourishing than they were a generation ago.

Mr. E. Guy Dawber proposed "The Guests." In the course of his remarks he said at a gathering of architects he was always glad to meet with men of other professions and other spheres of action; it enlarged their sympathies, and helped them to understand their respective interests. It was given to few to understand and appreciate the arts of music, sculpture and painting; but, whether they liked it or no, everyone must to a certain extent study the art of architecture, because on their daily walks it was brought to their notice on every side, and they could not get away from it; and in the amount of building going on in London and the provinces he felt the architects of this decade must stand or fall in the future. They all as a profession owed a great deal to the illustrated press and the press in general, for there was no question it aroused the more educated classes to an enthusiasm for architecture and an appreciation of their art, particularly on the domestic side, that had not been in evidence since the Victorian era.

In responding, the Bishop of London said he felt it a special compliment that they should have invited him to be present, and he hoped they would not think him the iconoclast the press made him out to be. He would not go into the question of the City churches, but he could assure them that no one admired beautiful architecture more than he. He would rather resign his See than see hands laid on such beautiful churches as St. Bartholomew the Great or the church he opened the other day. He also wanted to see that nothing was done to endanger the safety of St. Paul's Cathedral. He knew nothing about whether the proposed St. Paul's Bridge would endanger the Cathedral, but he called upon them to see that nothing was done which would endanger it. The art of architecture was the art most needed to-day. The housing was appalling, and was responsible for most of the immorality which they met. He wanted churches, but he could not get them. He used to build five churches every year before the war, but he had only succeeded in having o built since, and the cost had been £18,0 The Church could not afford that cost—it h not got the money. How were they to d with that tremendous problem? The Chur was short of money, and he wanted archite to tell him how they could get the churc they needed and at the same time spare t City churches.

Lord Olivier also responded.

KING'S COLLEGE, CAMBRIDGE, CO PETITION.

The Council of the Royal Institute of Brit Architects have had their attention called to t recent correspondence in the professional pr on the subject of the Collegiate Buildings Co petition for King's College, Cambridge. At t request of theCouncil the matter was investigat by a Committee, which submitted the followi report:—

"We have made a careful examination of t instructions issued to the competitors in t competition, and also the correspondence a comments which have appeared in the Pr regarding the successful design.

"We have also interviewed Messrs. Budden Rowse, the winners of the competition; Mess Tait & Rees, the writers (with Mr. Gordon H of the letter which was the subject of the co plaint; and Mr. Lovett Gill, the Assessor.

"It should be observed, firstly, that the Co petition was a small private limited competiti and as such did not come under the regulatio of the R.I.B.A., and, in point of fact, was not accordance with those regulations; second that so far as the cost, planning and style of proposed buildings were concerned, cert suggestions only were made in the instructi issued to the competitors, but emphatica there were no binding conditions; and, thir the award having been made by the assessor, confirmed by the Building Committee and Governing Body of King's College. We are opinion, first, that the assessor was perfec justified in the award which he made, and t Messrs. Budden & Rowse won the competit by perfectly fair means and without violat any conditions; second, that the letter sig by Messrs. Tait, Holt & Rees was unfair co ment in that it charged Messrs. Budden & Ro with violating conditions; and, further, it dicated that they had won the competition unfair means, and as a result other let appeared in the Press which, in the m accepted the statements of Messrs. Tait, Ho Rees as the truth; and,third, that Messrs. Bud & Rowse have suffered professional injury result of the letters published in the Pre particularly as a result of that signed by Me Tait, Holt & Rees. We therefore recommend Council to call upon Messrs. Tait & Rees to i a statement in the Public Press withdrawing offending letter and apologising to Me Budden & Rowse."

This report was approved by the Counc the R.I.B.A. on March 3, 1924.

At the request of the Council Mr. Thos Tait, A.R.I.B.A., and Mr. Verner O. R A.R.I.B.A., have written the following le and Mr. Gordon H. G. Holt has asked t allowed to associate himself with it:—

April 4, 192

Sir,—With reference to our letter which published in the Technical Press in Nover last regarding the above competition, we informed that the successful architects, Me Rowse & Budden, have been prejudic affected by the statements contained there

On reflection we frankly admit that assertion that the winners had violated an the conditions was wrong and that the infer contained in the letter that Messrs. Row Budden had won the competition by t means was entirely unjustified.

We sincerely regret our action has pre cially affected Messrs. Rowse & Budden, the causing them to suffer damage, and we ask t here and now to accept our very sincere apo

Yours faithfully,

Thos. S. Tait.

ROYAL ACADEMY EXHIBITS

Particulars of a number of the Royal Academy Exhibits illustrated in this issue are given below :—

Messrs. Liberty & Co.'s New Premises, Argyll-place, W.

Within a few yards of the new Regent-street, and just behind their East India House in that street, Messrs. Liberty & Co.'s half-timber building is fast nearing completion. In Regent-street the Crown has insisted that the rebuilding shall follow the traditional Renaissance style, and laid down the principle of designing the street by blocks so that each block of buildings is a unity of design, though may consist of a number of different shops.

In Argyll-place Messrs. Liberty have the freehold of an island site bounded by Argyll-place, Great and Little Marlborough-streets, and Kingly-street, and here they are free to develop their own ideas of the setting in which to display their business. Messrs. Liberty rejected the scheme of having on this site a Renaissance building which might be linked in design with their new East India House in Regent-street, and decided to erect their present black and white building. With a view to maintaining the domestic scale, the motive of design has been rather a series of shops—a minster "row"—than a single great pile. The examples of the craftsmen's works with which Messrs. Liberty concern themselves will be shown in rooms of a height and kind that people live to live in, where the wares can be judged by a true scale of domestic surroundings and not dwarfed or given fallacious qualities as in the vast emporia with stories 20 ft. high or more.

Notes of historic interest are woven into the design. There are many old Tudor coats of arms made from designs of Mr. Kruger Gray, and wrought by Mr. Laurence Turner. On the gable facing Regent-street are the arms of Queen Elizabeth; on the entrance door the arms of Great Harry's six wives are grouped together, perhaps for the first time in history. High above the main entrance is a gilded copper weathercock, a model of the *Mayflower*; small as it looks from below, this is over 4 ft. high, and weighs over a hundredweight. This ship, as well as the windows, picked out with little tinted pictures on glass, is the work of Messrs. Wainwright & Waring. The lead gutters and downpipes are nearly all specially designed by the architects, and made by Mr. J. L. Emms.

Of the building itself, designed by Messrs. Edwin T. & E. Stanley Hall, the timbers were obtained from two old men-of-war. There are some five miles of timber in the framing of the building, varying in size from 15 in. sq. to 6 in. by 5 in. The stonework is Portland. The blocks have never been sawn, but are chiselled right from the quarry face. The brick chimneys were specially made by the Daneshill Brick & Tile Works, Ltd., of Basingstoke. The roofing tiles are hand-made Tucker's tiles from Loughborough, and the stone roofs of the entrance porch are of Herefordshire stone slabs.

Internally there is a wealth of carved oak and teak; oak stairs with solid steps and carved balustrades and panelling; tiers of deep galleries about open wells covered with heavy timber-beam roofs, with linenfold and other carved dadoes. Messrs. Liberty have themselves largely designed and made at their Shaftesbury workshops the panelling and fitments of the interior; and there is much interesting and curious plaster enrichment to the friezes and ceilings of the showrooms.

In spite of its old-world appearance, the building satisfies all the L.C.C. and Westminster Act requirements as to hygienic, fire resisting, and fire escape requirements. There are four main staircases serving all floors, three subsidiary staircases, and four lifts. The interior is subdivided into eight fireproof compartments, and there is a total floor area of about 3 acres. A sprinkler installation is installed throughout, and an automatic fire alarm rings to a fire-call station. The basement galleries are ventilated by the Ozonair system, and a central vacuum-cleaning plant is installed.

The entrance to the building is immediately opposite the lower end of Argyll-street. A large oak screened vestibule opens into a central gallery, open from the ground floor to the roof. On each side of this is a similar gallery, and open wells with wide balconies on every floor. At the extreme west of the western gallery is a wide open staircase of oak enriched with carved posts and panelled balustrades. The whole of the ground, first and second floors, and portions of the basement, third and fourth floors, are allocated to showrooms.

On the third floor are the counting house and other offices, and on the fourth and fifth floors are kitchens and dining rooms for a staff of 1,100 men and women. In the basement is the boiler house, which supplies heat and hot water to Messrs. Liberty's new Regent-street block, and to their premises across Little Marlborough-street, as well as to this building. Here, too, are a pair of deep-water wells, the Ozonair and vacuum-cleaning plants, and the electrical switch-board room. There are over two thousand electric lighting points, and about 40 miles of electric wiring, including 12 miles of conduit. The shop window lights are controlled by a clock-work process, so that the lights may be cut out automatically at any given time after the building is shut for the night. In the office portion on the third floor is a telephone exchange. Synchronised clocks are also installed in all the principal departments.

This building is already connected by a subway and bridge to Messrs. Liberty's premises in Little Marlborough-street, and by a subway to East India House. A portion of East India House adjoining Foubert's-place has already been built; this block will be completed up to Argyll-place as soon as the old shops can be vacated. There will then be direct access from East India House to the Tudor building in the basement, and also by a bridge across Kingly-street on the second, third, and fourth floor levels.

The following firms are principally concerned in the carrying out of this building :—Contractors: Messrs. Higgs & Hill, Ltd.; consulting electrical engineer: Mr. H. E. Keen; chief clerk of works: Mr. A. Turner; engineering clerk of works: Mr. E. J. Ison; head foreman of works: Mr. J. Corfield. Craftsmen and sub-contractors: Messrs. Liberty & Co., Ltd., internal panelling and decoration; L. A. Turner, wood carving; Kruger Gray, heraldic designs; J. L. Emms, ornamental leadwork; Cecil Ern & Co., Ltd., art metal work; Wainwright & Waring, Ltd., steel casements, shop windows, weather vane, &c.; Daneshill Brick & Tile Works, Ltd., ornamental chimney stacks; Dorman, Long & Co., Ltd., steelwork; South Western Stone Co., masonry; F. J. Barnes, Ltd., Portland stone; Mather & Platt, Ltd., sprinkler installation; Leo Sunderland & Co., Ltd., electrical work; Art Pavements & Decorations, Ltd., Biancola partitions; Acme Flooring & Paving Co. (1904), Ltd., parquet flooring; Benham & Sons, Ltd., kitchen fittings; British Challenge Glazing Co., patent skylights; Comyn, Ching & Co., Ltd., ventilators; Castles' Shipbreaking Co., Ltd., old ship timber, oak and teak; Dennison, Kett & Co., Ltd., steel rolling shutters, &c.; Dent & Hellyer, Ltd., sanitary fittings; Doulton & Co., Ltd., sanitary fittings; Shanks & Co., Ltd., sanitary fittings; G. N. Haden & Son, Ltd., heating and hot water; G. Matthews, Ltd., decorative wall tiling; Ozonair, Ltd., Ozonair ventilation; Davey Paxman & Co., Ltd., boilers; Patent Victoria Stone Co., Ltd., staircases and paving; Albert J. Shingleton, skylight and shop blinds; The Synchronome Co., Ltd., electric clocks; Waygood-Otis, Ltd., lifts; Thomas Faldo & Co., Ltd., asphalte; Siegwart Fireproof Floor Co., Ltd., fireproof floors; J. A. King & Co., pavement lights; W. Mallinson & Son, Ltd., wainscot; Le Grand Sutcliff & Gell, Ltd., artesian wells; Roberts, Adlard & Co., Ltd., tile and stone roofing; Sturtevant Engineering Co., Ltd., vacuum cleaning plant; Associated Fire Alarms, Ltd., fire alarms; S. Lintern, teak sinks; Joseph Kaye & Son, Ltd., ironmongery; Carter & Aynsley, Ltd., ironmongery; Horace W. Cullum & Co., Ltd., cork flooring; Bell's United Asbestos Co., Ltd., Decolite flooring.

New Church, Ampleforth Abbey, Yorks.

The work at present being undertaken consists of only about one-third of the entire scheme. This is being built on at the west end of the existing church, the present west wall being pierced with a wide arch to connect the old work with the new. Later on the intention is to pull down the existing church and to complete the remainder of the new scheme. Broadly speaking, the completed building will consist of three large compartments or bays, separated by transverse arches and roofed with domical vaults. The vault over the central bay will be at a higher level than those over the two end bays, and above will rise the central tower. The western-most bay (the one now being built) will form the monks' choir, while the central and eastern bays will accommodate the boys from the College and also the public. Along the south side of the building will be two rows of chapels, one row being level with the floor of the church and the other placed in a crypt below; this arrangement was suggested by the steep slope of the ground. One of the chapels at the main floor level will be the war memorial chapel, which, it should be noted, is included in the present section of the work. The walling is faced externally with rubble-work, with wrought quoins and dressings. Bramley Fall is the stone used both for rubble and dressed work. Internally the walls will be plastered, the piers, arches and other dressings being of Blue Hornton stone. The domed ceilings will be of reinforced concrete, plastered, while the outer roof will also be of reinforced concrete, covered with greenish grey slates. As regards the question of style, an early type of Gothic has been adopted, with a suggestion of Romanesque feeling, though no round arches have been employed. The site is a very fine one, the building being situated high up on the southern slope of a steep hill, and it will stand out very prominently when seen from the valley below. Internally, the most distinctive feature will be the reredos. This will stand in an isolated position at the junction of the retro-choir, or monks' choir, and the main body of the church. It will take the form of a large arch, embellished with sculpture and carving, and will form a kind of canopy over the two altars which will be placed back to back below it; one of these altars will serve the retro-choir, and the other the main body of the church. The reredos will be constructed of blue Hornton stone.

The general contractors are Messrs. Holloway Bros., Ltd. The blue Hornton stone is being supplied and worked by Messrs. J. F. Booth & Son. The reinforced concrete engineers are the Trussed Concrete Steel Co., Ltd.

Mr. G. Gilbert Scott, R.A., is the architect.

Westfield College, Hampstead.

This drawing shows part of a recent addition made to Westfield College, Hampstead. Mr. W. Curtis Green, A.R.A., is the architect. The general contractors were Messrs. J. W. Falkner & Sons.

Barker's New Premises.

This drawing is an ½ in. scale detail of the centre bay of Messrs. Barker's new premises, High-street, Kensington. The bay is the centre of five bays, executed in Portland stone, the spaces between the piers and windows being filled in with Mazzano marble panels set in a frame of Belgian black marble. The columns by the entrance are of Belgian black with bronze caps, gilt. The whole of the façade and exterior of the building has been designed by Sir Reginald Blomfield, R.A., architect, of New-court,

Temple, the interior and constructional work being designed by Mr. H. L. Cabuche, O.B.E., architect. Additional particulars of this building will be given in a further issue.

New War Memorial Chapel at Durham School

The chapel has been designed on simple and dignified lines. The plan consists of a wide nave and chancel under one continuous roof, with short transepts, and a wide open narthex: a small chapel north of the chancel, and a vestry and sacristy south of it. The chancel is ample for a large gathering, and the vestry and sacristy (containing 300 sq. ft.) are placed on the south of the chancel with direct communication with the chancel and south transept, and also with the outside. The interior of the chapel is to be treated with a simple scheme of arched vaulting, which is to be executed in fibrous plaster. The walls are to be faced on the outside with local flat-bedded scutch faced rubble of a warm and broken colour (of yellows, reds and browns, such as can be seen at the cathedral and college). The stone for all dressings such as plinths, sills, strings, windows, doors, copings, etc., to be from the same local quarries. The internal walls are to be plastered (for colour decoration), and provision is being made for a future panelled dado up to the window-sill level.

The general contractors for the work are Messrs. Rudd & Son, Ltd., of Grantham, and the architects are Messrs. Brierley & Rutherford, of 13, Lendal, York, who were successful in a limited competition for the chapel held last year, and for which Sir Charles Nicholson was the assessor.

Women's Institute, Milford.

This building is now being erected in the village street at Milford, in Surrey. It consists of a main hall with open timber roof, having a raised stage at one end and a gallery at the other. The projecting wings to road contain kitchen premises, sitting room and lavatory. The walling is built of 2 in. bricks from Messrs. Pascall, of Wrotham. The heating system is by Messrs. Norris & Dutton, of London. The casements and glazing by Messrs. George Wragge, Ltd. The builders are Messrs. F. Milton & Sons, of Witley, Surrey. All the woodwork is in English oak.

Messrs. Baillie Scott & Beresford are the architects.

Cottage Hospital at Weybridge.

This illustration shows the selected design for the Cottage Hospital, Weybridge, plans of which were published in *The Builder* for February 22.

The site being somewhat peculiar in shape (the only approach is by a narrow strip of land leading from the main street), it was decided that the whole of the hospital must be planned on the back portion of the land, with the exception of the porter's lodge and ambulance garage, which were designed as gate lodges to join the entrance from the road.

The hospital comprises: Wards for twelve male patients, twelve female patients, and six children; and six single-bed wards for private patients. A feature of the hospital is a complete therapeutic department with men's and women's wards, physical exercise rooms, recovery, bath department, diathermy, and private wards. There is an operating unit and the usual administration offices. The wards have been planned with their axes north and south, and the private wards have been given a south aspect. The nurses' and maids' rooms are placed in the second and third story over the central block. The ward roofs have been kept flat to allow for future extension. The architects are Messrs. Arthur Wm. Kenyon, F.R.I.B.A., and Stanley G. Livock, A.R.I.B.A. The perspective drawing is by Mr. Cyril A. Farey.

Mosque, Kasr-el-Aini Hospital, Cairo.

This drawing forms a detail of Messrs. Nicholas & Dixon-Spain's design for the Egyptian State Hospital at Cairo. The plan of the Mosque is peristylar following generally the arrangement exemplified in that of Sultan Al-Malik al Muayyad Shekh at Cairo. It consists of a three-aisled chief lîwân and flanking single-aisled lîwâns, all open and with flat coffered ceilings. The Mihrâb and Minbar exhibit some concentrated ornamentation, but the general architectural effect is in terms of arcading. The fountain in the centre of the Sahn is ornamental as a Meidâ is provided in the extremity of each of the flanking lîwâns.

Additions to Insurance Building, Euston-square.

This addition is a wing on the north side of the block of offices erected at the corner of Euston-square and Euston-road some few years since. The addition contains offices, housekeeper's quarters, and cloak rooms. The elevation is of Portland stone; the construction of the floors and roof is steelwork and concrete. The builders are Messrs. Foster & Dicksee, Ltd., of Rugby; and the steelwork is by Messrs. H. Young & Co., of the Thames Ironworks. Professor Beresford Pite is the architect.

House and Stables, Queen Camel.

This house and stables, &c., which are now practically completed, are built in the local manner with stone from the Keinton Mandeville quarries, with the roofs in dark sand-faced tiles; and the windows ordinary wooden casements and frames. The builders are Messrs. Bird & Pippard, of Yeovil; the heating and sanitation has been executed by Messrs. Dent & Hellyer, of London; electric lighting and bell installation and plant, by Messrs. Waring, Withers & Chadwick, of London; door and window furniture, by Messrs. J. Elsley, Ltd., of London.

The architect is Mr. E. Guy Dawber, F.S.A., F.R.I.B.A.

The Plaza Theatre.

The Plaza Theatre is in course of construction at the corner of Lower Regent-street and Jermyn-street. The main contractors are Messrs. Arthur Vigor, Ltd.; and the principal sub-contract which has been given to date is for steelwork, to Messrs. Moreland, Hayne & Co., Ltd.

Mr. Frank T. Verity, F.R.I.B.A., is the architect.

Golf Cottage, Woking.

The house is built on the site of a smaller building removed for this purpose. Local bricks used were supplied from Knaphill and tiles from Messrs. Mitchell, at Guildford, and Messrs. Van Straaten. The general contractors were Messrs. Mardon, Bull & Co., of Farnham, Surrey; heating and hot water, Messrs. Comyn, Ching & Co.; electric wiring by the Woking Electric Supply Company; electric fittings, Messrs. Gillham & Jones, Newman-street, W.1; carving in the wood brackets, etc., to doorways, Messrs. W. Aumonier & Son; the sanitary fittings, including baths, lavatories, and fireplace interiors, Messrs. McDowall, Steven & Co.; w.c. fittings, Messrs. Tylor; range, Messrs. Smith & Welstood.

Pavilion—Palace of Industry.

This Pavilion has been designed for Messrs. Spillers' Milling & Associated Industries Ltd., by Mr. Edward Maufe, M.A.Oxon, F.R.I.B.A. It forms an entrance to the Food Section in the Palace of Industry, and in it each of these associated firms has its separate exhibit, grouped in deep alcoves lighted from above by hidden lights. There is an outer and inner hall, the alcoves of the latter being designed round a central office. The exterior, though a serious contribution to exhibition architecture, is gay and full of colour, symbolising the golden corn and the green of the earth, while through the arches is seen the velarium, like a white cloud against a blue background. High up at the end of the inner hall is an excellent map by Mr. Macdonald Gill, showing the distribution of Messrs. Spillers' various activities. The lettering was carried out by the Dorian Workshops; the electric lighting by the Springvale Electrical Company; the velarium and banners by Messrs Heal & Son; the fibrous plaster work by Messrs. W. Aumonier & Son; the flooring being "Paraflor" supplied and laid by the North British Rubber Company. The general contractors were Messrs. Holloway Bros Ltd.

Meeting Room at the R.I.B.A.

The new Meeting Room, at 9, Conduit-street, is the outcome of a small plot of ground being acquired at the rear of premises in Maddox street. The new room is roughly square, about 46 ft. by 46 ft., and lighted by a central glass dome, supplemented by domes in the four corners in order to secure abundant light for drawings hung on the walls. As far as possible the walls are left perfectly plain in order to give hanging space for exhibition purposes. The old doors have been re-used, but a new piece of panelling has been put behind the platform to receive the names of the R.I.B.A. prize-winners and to reflect sound. The whole question of acoustics was studied by Mr. Hope Bagenal, and by his advice the wall opposite the platform and the frieze along both sides of the room are padded with Cabot quilting in order to prevent an echo while the sound is reflected from the platform end of the room by means of wood panelling. The result is very satisfactory.

Messrs. John Greenwood, Ltd., were the builders, the domes were made by Boulton & Paul, Ltd., the glass roofs by the British Challenge Glazing Co., the heating and ventilation by J. Jeffreys & Co., Ltd., the electrical work by Messrs. Locke & Soares, and the acoustic work by the May Construction Co., Ltd.

The architect is the Hon. Secretary, Mr. Arthur Keen.

Uppingham Hall and Class-rooms.

The hall and fifteen class-rooms form two sides of a quadrangle, which has now been laid out with a turfed lawn and stone paved walk, almond trees, and beds of lavender. The buildings are of Welldon stone and Edmonton Weston walling and roofed with gray and russet slates in graduated courses. The drawing shows the class room wing from the north. The class rooms are on the south or quadrangle side, and the corridors on the north. The arrangement of gable-end and roof grows out of this plan. The two upper ranges of class-rooms and corridors are floored with grey rubber. The ground floor is laid with "Decolite." The internal walls are finished with a painted dado and white distemper above. The paintwork in the corridors is grey; there are various colour schemes in the class room dados—grey, bright apple-green, dark blue-green, with gold or silver on the radiators. The whole of one wall in each room is painted to serve as a blackboard. The hall will accommodate 900. Its open timber roof is of Douglas fir, tanned by exposure to the weather and used as it came from the saw-mill. The wrought-iron work is slightly emphasized with colour and gilding. The external doors are of teak and the lead turrets have been gilded dot.

Messrs. Ernest Newton, R.A., & Son are the architects; general contractors, Benfield & Loveley, Ltd., Oxford; heating and electric lighting, Wenham & Fowler, Croydon; hall—glazing, Crittall Manufacturing Co., Ltd.; oak floor, Acme Flooring Co.; class-rooms—glazing, Browclough & Sanders, Lancaster; flooring, "Decolite," Bell's United Asbestos Co., Ltd.; flooring, india-rubber, Charles W. L. Lambe, Ltd. The fireproof floors were built to design and under the superintendence of Oscar Faber, O.B.E.

Marlborough College Memorial Hall.

The drawing shows one of the two entrance pavilions which flank the main colonnaded front facing the garden and forecourt. It is built of Portland stone and narrow brick. The doors will be painted blue-green. The grill above the doors is bronze, and can be opened to clean the plate glass. The paved terrace is of York stone, with one square of green Connemara marble on the axis of each entrance door. There will be no inscription in the plain stone s

ove the door. The vestibule beyond the door 19 ft. square and paved with Portland stone d slate dots. From it a flight of seven steps ds to an inner lobby of oak which stands inside e hall and gives access by means of double ing doors to an ambulatory 8 ft. wide, which ns round the back of the semi-circular audi-ium, and is divided from the tiered seats by broad oak balustrade with standard lanterns t. high arranged on each side of the seven ngway openings, which give on to the seats. e names of the fallen will be cut on the frieze an Ancaster stone dado running round the ditorium wall between the sash windows.

Messrs. Ernest Newton, R.A., & Son are the chitects; general contractors, Holloway Bros., d.; carving (names), Mr. Laurence Turner; ne and oak, Mr. Esmond Burton; bronze d leadwork, Thos. Elsley, Ltd.; heating, ring and lead glazing, Wenham & Fowler, ydon; Roman tiles, Messrs. Ames & Finnis.

Warneford House, Sudgrove.

This house has recently been erected in the tswold Hills between Stroud and Cirencester, d occupies the site of an old stone manor use which was totally destroyed by fire in 14. A good deal of the old stone and stone tes have been re-used in the new house, but ond this nothing of the old house remains cept the garden and outbuildings. The new ne used has been quarried on the estate. e entrance front is to the north, and the ncipal front to the garden is south over-king a charming view of the Stroud valley. interesting feature of the interior of the use is that the staircase, doors, and wood-rk generally have been treated and stained a light, warm grey colour, unpolished, and whole of the walls have been distempered a similar tone.

Messrs. Jacob Long & Son, of Bath, are contractors for the building; Messrs. ung, Austen & Young have carried out the ting and hot-water work; casements by ssrs. R. E. & C. Marshall, of Cheltenham; ded glazing by Messrs. G. Farmiloe.

The illustration is from a pen-and-ink draw-by the architect, Mr. A. N. Prentice.

Bishopsgate Telephone Exchange.

This building is being erected to house an omatic telephone installation. As the build-only faces on to narrow and unimportant ets the greatest simplicity of treatment was ed for. The brickwork is faced with London ks, with joints raked out so as to give a sunk earance; the recessed faces around the dows are formed of dark bricks from the old dings found on the site. The stonework, pt for the plinth and the architrave and ice of doorway, which are in granite, is all in land stone. The contractors are Messrs. sums, Ltd., and the Portland stonework is g worked by Messrs. Frank Mortimer, Ltd.; granite is being supplied by Messrs. Brookes, , and the steelwork is by Messrs. Archibald awnay & Sons, Ltd.

he architect is Mr. John H. Markham, .I.B.A., of H.M. Office of Works.

Antrobus House, Amesbury.

his building serves a double purpose in that a museum and a village club, bequeathed r the will of Lady Antrobus to the town of sbury. These public rooms are flanked on side by a small library and a caretaker's ge and by a residence for the curator. iew of the old-world character of Amesbury, as considered advisable that the new build-should follow traditional lines. The total of the works will be within £9,000.

e architect is Mr. Geoffrey Fildes, A.R.I.B.A. contractors are Messrs. James & Cockerell, alisbury; heating and hot water, Young, en & Young, London; facing bricks, nas Lawrence & Sons, Bracknell, Berks; ue sand-faced tiles, Wiggins & Co., Ham-smith; asphalte, Engert & Rolfe, Poplar; nongery, James Gibbons, Ltd., London; mental wrot iron, Gardiner, Sons & Co., Bristol; entrance gates, Messrs. Hart, Peard & Co., Ltd. (the Birmingham Guild).

St. James's Church Hall, Muswell-hill.

This work has not yet gone out to tender, and when executed will probably be considerably amended. The design reproduced is to provide a hall for 300 seats, and an additional 100 seats in the gallery. There is a small hall on the first floor at the back of the building to seat 200 persons. Classrooms, retiring-rooms, and kitchen are placed under this small hall. The site is at the corner of Fortis Green-road and Birchwood-avenue. The exterior walls are intended to be of multi-coloured bricks with picked red brick dressings. Mr. G. G. Wornum, F.R.I.B.A., is the architect.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

Domestic Hot Water Supply.

Sir,—I have been called in to examine a domestic hot water supply system which was found to be unsatisfactory in not providing in reasonable time a good supply of hot water. The pipes are all arranged correctly, and the runs appear to be well thought out. The cylinder, however, appears to be over large for the size of the boiler, and I had thought of advising the fixing of a smaller cylinder as a corrective. This will, however, entail rather an expensive and inconvenient upset in the house which I am anxious to avoid. Can you suggest a simpler mode of procedure?

"Architect."

Laying-out a Building Site.

Sir,—I shall be glad of your opinion on the following:—

Some years ago a half street was laid out 20 ft. wide adjoining a vacant field, and on one side large villas were built on sites 300 ft. deep with building line set back about 100 ft. The roadway in question is still private and not taken over. The owner of the vacant field is now laying out same in small sites, with a cul-de-sac road up the middle, the backs of one side facing on to the half street, which has semi-detached houses on the opposite side. Kindly answer the following:—

(1) Can the Council agree to this?

(2) Have the adjoining owners any redress, seeing that a new building line in advance of the existing houses is fixed?

(3) If so, is it against the owner of the field or otherwise?

(4) What powers have a local authority to bring forward a building line?

(5) Can you state any similar legal cases bearing on the point, or suggest a book of references on points in by-laws?

J. Landell Nicholson.

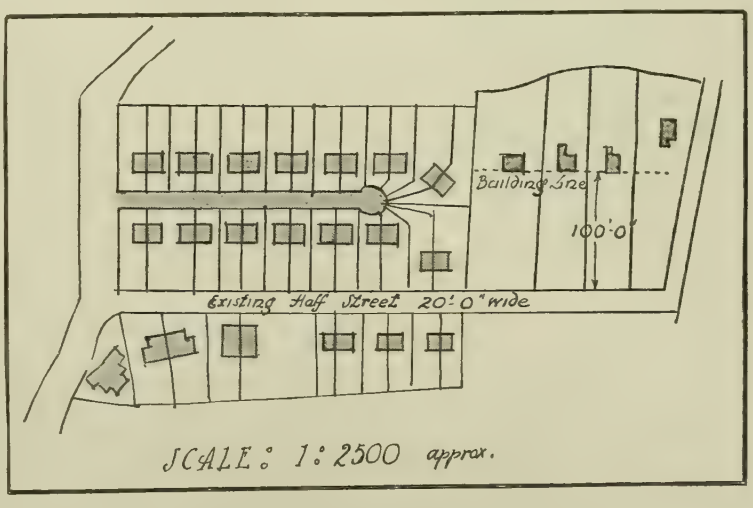
Liability for Accident.

Sir,—I shall be pleased if you can help or advise me *re* the following, or refer me to any similar case that may have been fought out in a court of law:

A plumber is employed on day work by a firm of builders, who have insured him against accidents. He is requested by a friend to do some work in his spare time for another man (a householder) and does the work required in his own time. A bill is presented by the plumber to his friend, who recommends him to call with the bill at the residence of the householder. When he presented himself he was requested to inspect a flat roof on which it was proposed to lay zinc, also to inspect a low-pitched slate roof through which the rain was percolating.

A ladder belonging to the householder was raised, the plumber ascended, and the householder stood on the bottom rung. Whilst inspecting the roof the ladder slipped and the plumber grabbed at the gutter, which came off, and he fell about 20 ft., fracturing his leg. The householder denies liabilities. Naturally, as the plumber was working in his own time his employers cannot accept responsibility. Would you advise taking proceedings against the householder or is it advisable to let the case drop?

Architect's Assistant.



This is a particular case involving many points, and the inquirer would, on the facts as stated, do well in the first instance to consult a solicitor, who would then advise him after fuller particulars how to frame an action, which, the circumstances undoubtedly suggest, should go forward.

Amongst the points are:—What was the position of the plumber? Was he a "workman"? Had he any contract of service at the time of the accident? And, if so, with whom? Could the action be brought under the Workmen's Compensation Act? Should the action be one for "negligence" on the grounds that there was a duty cast on the householder to use care?

The plumber was permitted by his regular employer voluntarily to undertake work for this householder, and in the advancement of the plumber's own interests; in which case the employer for whom he had undertaken the work was responsible for any injury which might result from his (the employer's) lack of care during the course of the work or from the defective condition of the building.

See Heaven *v.* Pender (11 Q.B.D. 503), where Brett, M.R., defined "negligence" thus:—"Actionable negligence consists in the neglect of the use of ordinary care or skill towards a person to whom the defendant owes the duty of observing ordinary care or skill, by which neglect the plaintiff, without contributory negligence on his part, has suffered injury to his person or property."

"A.Z."

(See inquiry by J. Landell Nicholson.)

WESTMINSTER ABBEY RE-EXAMINED—III

By W. R. LETHABY.

HENRY VII's CHAPEL: SCULPTURE AND GLASS.

"*King Henry the Seventh for the burial of himself and his children adjoined thereto, in the east-end a chapel of admirable artificial elegancy; for a man would say that all the curious and exquisite work that can be devised is there compacted; wherein is to be seen, his own most stately magnifical monument, all of solid and massie copper.*"—(HOWEL'S "*Londonopolis*," 1657.)

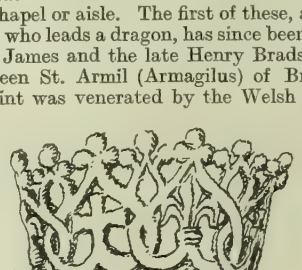
"*In* 1803 *they first began their innovating career and professional blows were dealt against the devoted walls.*"—(JOHN CARTER, 1812.)

SCULPTURE AND SCULPTORS.—The King provided by his will that 10,000 Masses should be said for the "weal of his soul," in honour of the Trinity, the Five Wounds of Christ and the Five Joys of the Virgin; the nine orders of Angels, the Patriarchs, the twelve Apostles, and All Saints. This indicates what was in the mind of the founder The sculptured saints, of which nearly a hundred exist, have been most fully described and identified by Micklethwaite, in *Archaeologia*, XLVII. They were to have had their names painted on labels carved for the purpose on their supports and similar to the labels under the external images. Since this time I have had the opportunity of examining some of them from a scaffolding. The central figure at the east end is Christ, who holds a book open *outwards* in the left hand, while the right is raised. His foot is on the globe of the earth. This would seem to be Christ of the Second Coming, and it would give a key to the whole assemblage of Saints if they are accessors of the final Judgment.

To the right of Christ (south) is the Virgin, and to the left is an Angel. This pair has been interpreted as the Annunciation. The angel carried a *sceptre* in the right hand, and this suggests that the meaning may have been the recognition as Queen of Heaven which follows on the Doom. Only the head of the sceptre now remains; the Angel's left hand grasps the end of a long marvellously undercut scroll, the inscription on which would have made the meaning clear.

Beyond again are St. Peter and St. Paul, the former with book and great key, and the latter with book and sword. The rest of the apostles follow. Most of their emblems are described by Micklethwaite; he calls that of Jude a boat, but it is rather the hull of a ship with a raised forecastle and interesting as a model of a mediæval ship (Fig. 1 b). The large hat worn by St. James has the plaiting of the straw indicated. Still further on, and now on the lateral walls, we find St. Anne on the north and Mary Magdalen with an aged woman on the south (St. Elizabeth?). St. Anne is teaching the Virgin to read, but the child's figure is an "emblem" only. Her intent reading face is very true and pretty, also her action in turning over the leaves of the book; it is a delicate and beautiful work.

Saints of the Church fill up the rest of the north and south walls, except in the western bays, where there are ten figures who appear to be ancient philosophers. These last are somewhat unusual, but they occur in some late stained glass in the Cambridge Library. (See also Didron's "Iconography," Vol. II.) It may be noticed that the royal saints of England —Oswald, Edmund, &c.—find a natural place in the assembly.



The scheme at the east end may be suggested thus:—

1 2 3 4 5						1 2 3 4 5
APOSTLES	PETER	ANGEL	CHRIST	VIRGIN	PAUL	APOSTLES

Several careful drawings were made of the images by Mr. S. Weatherley "when they were taken down to be cast"; this must have been about 1870, and a set of these casts exists at the Victoria and Albert Museum. The whole series should be photographed to a large scale, for the details which are minutely rendered are full of beauty and invention. There is fresh observation, realism and humour in these remarkable works of art which furnish a valuable image of the Tudor mind (*see* Prior and Gardner's "English Sculpture"). Fig. 1 B, is a sketch of one of the crowns which is very like that of the Virgin in the Eton wall painting. The figures are all in niches above a linked band of angels.

These sculptured angels are not fully distinguished into the nine orders, but there are warrior angels (St. Michael, &c.) and others clothed in feathers (Seraphin) as well as those in ordinary angelic vesture. They are occupied in no less an office than holding up the King's badges: Rose, Fleur-de-lys, and Portcullis.

Amongst a few figures which Micklethwaite left unidentified are two at the east end of the north chapel or aisle. The first of these, an aged warrior who leads a dragon, has since been shown by Dr. James and the late Henry Bradshaw to have been St. Armil (Armagilus) of Brittany. This saint was venerated by the Welsh and by

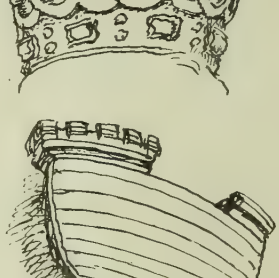


FIG. 1, A and B.

Henry VII. Micklethwaite later suggested that St. Ermine's (now an hotel) carries on the name of this saint.

Next to the image of St. Armil in the same north chapel, which I suppose may have been planned as a chantry for Prince Henry, later Henry VIII, is the figure of a king beardless and with a book. Of this image Mr. Micklethwaite said: "This has been called Henry VI, but we have reason for putting him elsewhere"—that is, in an empty niche in the eastern chapel. The support under this empty niche has the letters H.R. on it, and it is not improbable that the figure once in it was Henry VI.

Several images, however, are repeated in the chapel, and there happens to be two of each of the companion figures of this king. I would suggest that if this chapel was intended for the heir of Henry VII then it would have been specially appropriate to have his name saint here, just as St. Margaret was put in the south aisle where Margaret, the King's mother, was to be buried (*See* the just published account of the "miracles" of King H. VI. I may remark here that in the transcript of accounts of Henry VII at the British Museum there are entries for writing and painting a book; can it be the MS. of the Miracles?) It might explain why this image has no emblem if it could be none other than Henry VI.

The statues and the rest of the work in a suitable degree was, or was to have been, coloured and gilded. In the King's will it was provided that "the walls, doors, windows, arches and vaults, and images, within and without, be painted, garnished and adorned with our arms, badges, cognisants and other convenient painting in as goodly and rich a manner as such a work requireth, and to a King's work appertaineth."

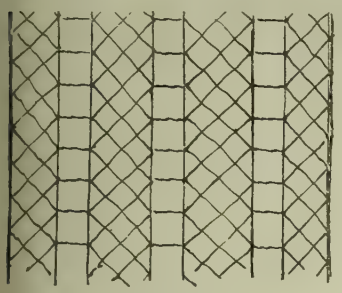
Gay and glittering in bright colour and gilding the long rank of figures ranged along the main walls, and appearing company after company in the several chapels, would have had an extraordinary appeal to the mind by its hypnotising iteration. Such were the thoughts of employers and craftsmen at the end of the period of workmanship and on the eve of a time when imaginative thought and act were to be washed away in a flood of talk about "architecture" by professional "art" middlemen.

Sculptors.—An important authority for the works of Henry VII at a time just before the new chapel at Westminster was begun is the Egerton MS. 2358, at the British Museum recording payments of Thomas Warley, Clerk of the King's works to Henry VII. It is concerned with certain works at St. Paul's connected with the marriage of Prince Arthur with the Tower, Westminster Palace, Greenwich and Eltham. It is in Latin, ill-written and abbreviated, so that I can make little of the details. Only minor masons seem to be named Walter Martyn, John Carter and others, but none are given the title of King's mason.

The most arresting entry is for the wages of "Sculptors" for sculpturing the Dragon, Lion and Leopards for the Cipher [?] in the Great Hall at the Tower. They were John Moore, Richard Codeman, Robert Bellamy, Nicholas Delphyn, and John Hudde. Robert Duke was employed painting and gilding the same. John Hudde also sculptured two Lions and a Great Rose with an imperial crown above it in Westminster Hall over the North Door. John Hudde and most of the other sculptors thus named were doubtless the authors of the great array of images at the King's Chapel—more than a "gross" of statues was a big order which required many artists.

Stalls and Pavement.—Of the woodwork of the Chapel Neale writes: "Neither the stalls nor seats are all of the same period as may be readily distinguished from the workmanship those which are co-eval with the completion of this edifice extend to the third arch on each side; the others were constructed on the revival of the Order of the Bath by George the First . . . . At the last installation two of the canopies were displaced from their original positions near the west end and affixed against the great piers eastward over new stalls, where they yet remain, but the stalls themselves have now been removed. It would seem, too, from the style of workmanship and other circumstances that all the canopies which surmount the stalls added in the reign of George the First originally formed the back front of those which are known to be coeval with the Chapel" (Micklethwaite says that the addition was made in 1725). The two canopies just mentioned were later taken down from the piers and are preserved in the triforium; the spaces from which they are supposed to have come may be seen at the west end of the ancient stalls. The backs of the canopies most easily seen are several against the south aisle, which have plain backs. Closer observation of others partly hidden and of many against the north aisle show that originally all were complete at the back as in front. In the north aisle also a pierced brattishing over the level lower part is preserved and thus the complete original form may be understood. A plan of the XVIth century in the Thorpe Collection at the Soane Museum which shows the original arrangement of the stalls, published by Burges in Scott's *Gleanings*, was reproduced last month. Burges, however, raised some difficulties in his comment, which must be noticed. "Thorpe's plan is not only valuable as showing us the positions of the altars, but exhibit the position of the stalls prior to their being altered in the reign of George I. It is generally asserted that a new bay of stalls was then added on either side; by a comparison, however, of Thorpe's plan with the actual building we shall find that the number of the stalls remains the same, the only addition being two rows of canopies which, however, were supplied by cutting off the hinder part of the original ones." This is not so clear as Burges usually was. The fact is that Thorpe's plan shows the stalls much narrower than they are, and moreover as carried

t up to the west end where the two "return ls" are on this plan. The stalls were lently only roughly sketched; that the ıber agrees, or nearly agrees, with the ent number must be accidental.
he important return stalls just mentioned e doubtless on occasion for royal use. There e quite charming kneeling figures of kings in ed oak on the fronts. That on the north only survives. From the king's beast lying ind him I suppose this one was intended for ry VI. The king saint is represented on screen at Whimple with an antelope gorged



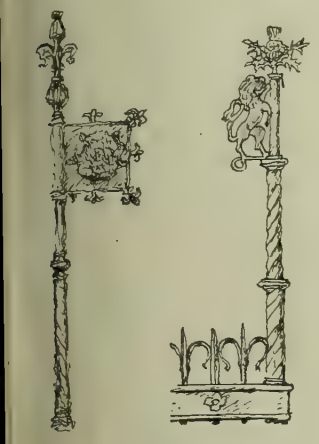


Fig. 2.

h a crown at his feet. Remember that two s on either hand beyond the east end of stalls had high stone screens curved on plan the bow windows of the aisles.
he original pavement of the Chapel remains he aisles, the eastern chapel, and in the tomb ntry. It is of small slabs of grey marble, laid alternating strips diagonally and square. s is the most general type of mediæval pave- t at least in London (Fig. 2). Notice on the t wall below the window three large painted secration crosses. The original wooden roof ve the vault has disappeared; doubtless it very much like that of King's College Chapel, ıbridge. The leaden down pipes of the rior appear to be original
spoke before of the vanes of the exterior. prevailing love for vanes was evident also ıin. The bronze boy-angels at the ends of founder's tomb carried banners; and the le standards of the tomb of the Lady garet, Queen Elizabeth, and Mary Queen of s, all had vanes, some memory of which is erved in the prints and drawings.
g. 3. A. is from a sketch by Carter from the s once on the "grate" which surrounded garet's tomb. The railing without the vanes

ecently been given back to the Chapel. It the work of Cornelius Symondson. B. is a small sketch in the Powell collection of anes once on the tomb of Mary Queen of . This railing has also been brought back ıe Abbey; it was probably by the same who made the beautiful "grate" of Eliza- s tomb which is shown in Neale's plate 57. was surmounted by fleurs de lys and roses, ıe frieze were the letters E.R., mixed with lions and falcons; there had been standards at the angles and in the middle; the whole had been gilt. Patrick the blacksmith received £95 for the work." (Fig. 4)—It is marvellous that the learned and powerful of a century ago could decree the destruction of the Roses of Elizabeth's tomb. The vanes of the exterior (on the *turrets*, not the pinnacles) were very similar to those of Margaret's tomb. Carter observed two standards remaining and one of the vanes is shown on the old sketch which he engraved.

Glazing.—A few fragments of painted glass which remain here and there are sufficient to show what the original scheme was like, even if it is next to impossible to imagine its beauty when complete.

This glazing was in part, as we shall see, destroyed in the Cromwellian period, and again it was subject to injury and loss in the eighteenth century. Of this later time John Carter wrote: "The whole of the basement part of this chapel is in a damaged state. The windows are broken, their lower divisions stopped up and their mullions hacked. Viewing the windows of the upper story I noticed that their mullions were kept from falling by boards. . . . Wish for an instant to see the place as at first, unsullied by dust and cobwebs; see the whole in perfect repair; the stopped up broken windows shining resplendent with their full assemblage of painted glass; its aisles and chapels unencumbered by intrusive modern objects; a monument of royal mortality. Our sight becomes distracted, our comprehension loses itself in this labyrinth; our senses forsake the clue of reason, and we sink

Fig. 4.

entranced into a state of unutterable delight. . . ."

Six of the windows on the south and one on the north side in the upper tier have been banded. Several of the eastern stalls are modern and are tolerable imitations. The first small chapel on the north side has its screen destroyed in part. The centre chapel, in which one statue is gone, has no determinations to give a situation for an altar. The fifth chapel: one of the statues is gone, and the screen nearly destroyed. . . . Some small portions of the painted arms and devices in the windows are yet visible; and in particular in the high east window a good figure. It is rather surprising as these paintings continue to be a general mark for stone-throwers, that a particle of them is in being. . . . The collection of statues represents saints and a small one on the stall on the left of the entrance is pointed out as the portrait of Henry himself" (*Gentleman's Magazine*, 1799).

The story of the destruction of the glazing under the Commonwealth may be gathered from the XIVth Report of the Historial MSS. Commission (Appendix, Part II, Welbeck MSS., 1894).

Among payments for "cleansing out pictures" at the Abbey in 1644–5, the following items appear:—1644, April 19—Receipt for 6s. by Thomas Gastaway from Sir Robert Harley for taking down the high altar of Henry the Seventh's Chapel. Sep. 30—. . . taking down the pictures in Queen Elizabeth's Chapel and carrying them to Sir Robert Harley's House.

1645, June 9.—Receipt by John Rutland from Sir Robert Harley of £10 towards glazing Henry the Seventh's Chapel with white glass.

July 15, £10. Aug. 8.—Receipt by John Rutland of £15 from Sir Robt. Harley towards glazing work done in Henry the Seventh's Chapel. (The account includes 498 ft. of glass in the west window, and 360 ft. of glass in the three east windows.) Sept. 11.—Do. for glazing work in do.

This sad record to some extent confirms *Mercurius Rusticus* (1685): "Sir Robert Harlow breaking into Henry VII's Chapel, pulled down the Altar Stone which stood before the goodly Monument of that King; it was a curious Touchstone, a Rarity not to be matched; there it stood for many Years, yet it did not escape the frenzy of this Man's ignorant zeal, for he broke it all to Shivers."

This is the purging celebrated in the pamphlet "God's Ark over-topping the World's Waves" (1646): "For the gaudy guilded Crucifixes . . . and Pictures placed and painted thereabout where the sinful Singing was used . . . now a thick throng of pious people . . . what a rich and rare alteration." (Dean Robinson's paper *W. Abb. in the XVIIth Cent.*). From the fragments of old glass still in the windows and from the glazing of King's College Chapel, Cambridge, which is known to have followed the Westminster scheme, we are able to understand the original arrangement at Henry VII's Chapel. The Westminster windows were undertaken about 1510, and the Cambridge windows about 1516. Of the latter we are told: "In this year an agreement was made between the executors of Henry VII and the provost of the College regarding the windows which were to be glazed with images, stories, arms, badges and other devices. In a contract for completing the Cambridge glazing, dated 1526, it was agreed that the windows are to be set up with good, clean, sure and perfect glass and orient colours, and *imagery of the Story of the Old and New Law after the form, manner and curiosity and cleanness in every part of the King's New Chapel at Westminster.* From a second contract of the same year we learn that Barnard Flower had originally contracted for the Cambridge windows, and had been several years engaged on the work. Since he alone was at first employed on so large an undertaking it seems likely that he was the popular man of his day, and possibly had been the painter of the West

Fig. 5.

minster windows." (*Archæol. Jour.*, Vol. XII.) According to Dr. M. R. James Barnard Flower, the King's glazier died in 1525 or 1526, having by that time completed four windows at Cambridge.

In his will Henry VII directed that the Westminster windows should be glazed with "stories, images, arms, badges and cognisants."

Now the King's College windows contain *stories* (subjects) from the Old and New Testaments, arranged as types and anti-types, *images* of prophets, &c., called "Messengers," and *arms, badges*, &c., in the tracery. The windows both at Westminster and King's College are of five lights in three and two tiers. At the latter the Gospel series occupies the lower row, and the Old Law the upper row, except for the central light in each case which contains a "Messenger."

The ancient glazing of the tracery at Westminster, and one figure which still exists now in the upper eastern light, correspond entirely with the King's College scheme. This remaining figure at Westminster is obviously a "messenger" like those at King's College. About sixty years ago it was pointed out that when this figure was examined through a glass it was seen to be "the prophet Jeremiah under a canopy holding a scroll and altogether 'a match' for the Messengers in the Chapel at Cambridge. This is a curious instance of a reflex light being thrown upon glass once a standard in the country, but now lost." (*Archæol. Jour.* XII.) In 1911 I was able to see this light from a ladder and to make a rough sketch of the head (Fig. 5). The figure or rather three-quarter figure, rises from a panel or predella of white glass with yellow stain, in which is a little figure of an angel under an arch holding a scroll inscribed *Jeremias pph.* The prophet is in a ruby robe and is set under a white canopy on an emerald ground. On the scroll is written *Patre*[*m*] *laudate nomen domin*[*i*].

We may now say that the upper windows at Westminster contained the Gospel story with parallels from the Old Testament, together with messengers of bigger scale in each window, except that the east window would have had the Crucifixion only. At Fairford again the scheme is very similar, and the fine Crucifixion window now in St. Margaret's Church close to the Abbey repeats the same type of composition. Of this window, indeed, there is a story that it was made at Dort in Holland and sent to Henry VII as a present for his chapel (*see* Westlake's *Stained Glass*, where the story is doubted). The exact evidence, however, is against such a theory, and the window appears to have been made for the chapel of New Place, Essex, as rebuilt by Henry VIII, and to be the work of the successors of Barnard Flower. (In regard to foreign influence on glass work at this time see the excellent recently issued *English Industries of the Middle Ages*, L. E. Salzman: a book full of freshly gathered facts on English craftsmanship.) There cannot be a doubt that Barnard Flower was the glazier of Henry VII's chapel. In the Egerton MS., and the other accounts mentioned above, he appears working for the King long before the chapel was ready for glazing. There can be no doubt that the clerestory windows of the chapel contained stories from the Old and New Testaments and a series of "messengers" leading up to a Crucifixion filling the east window directly above the Majesty in sculpture. Glass and sculpture represented the whole teaching of the Church. All had meaning: it was an encyclopædia.

At King's College Chapel, according to Dr. James, the two north-western windows are those usually attributed to Barnard Flower: "they contain the best and most delicate drawing in the chapel."

In Westlake's work on stained glass it is shown by comparing the little figure in the predella with one of the bottom panels in the earliest window supposed to be by Barnard Flower in King's College Chapel that both are by the same artist. (A similar treatment is found at Fairford.)

At King's College the badges in the tracery include the Lancaster Rose, the Hawthorn Tree, Portcullis, Fleur-de-lys, York Rose, and Initials H.R. and H.E.

At Westminster the original glazing of the quite small openings in the traceried heads of the clerestory windows yet remains in large part. In the four central piercings of each window are the four *quarters* of the Royal coat of arms, while the still smaller piercings round about are filled with bright coloured glass unpainted; small quatrefoil forms have a disc of ruby at the centre of four pieces of smoky blue—very simple and very effective.

The great west window, which is no less than fifteen lights wide, had tiers of figures under

FIG. 7.

canopies on red and blue grounds, and in the tracery, angels, heraldic badges and initials. The badges, portcullises, roses, fleur-de-lys, prince's feathers were on ruby and blue grounds; the initials are H.R. and H.E. for Henry and Elizabeth. The large lower windows in the five radiating chapels must all have had badges in coloured panels set in diamond glazing, such as are now found in the eastern window. The badges themselves are authenticated by sketches in the Powell collection at the British Museum, with the note: "Taken before the recent repairs." In Fig. 6 I give

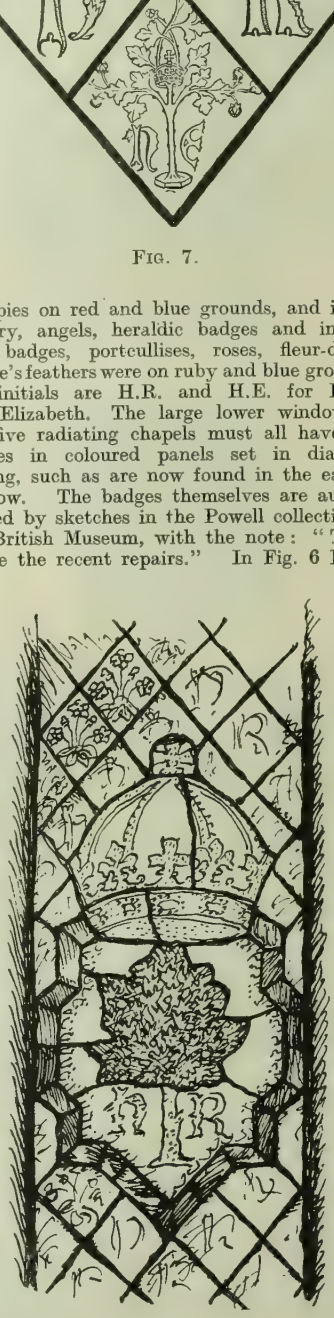

FIG. 6.

a rough restoration of these badge-panels in relation to the diamond glazing. It will be seen how easily the pretty form was obtained from the conditions.

The tiny little tracery piercings along t top lights are set with morsels of blue and ru glass, as described before. Badges are now on to be found in the central chapel; but, as t windows of the other radiating chapels ha the red and blue along the upper lights, wh they are otherwise the barest in the wh building, it may not be doubted that th also had these extremely effective badg A few similar badges are now in Jericho parlo

Keepe (1683), after speaking of "the fi wrought wainscot" of the stalls, adds: "n are the windows, where with this chapel further embellished to be neglected, eve light being composed of diapered and we painted glass, each pane containing either [t form of] a red rose, the badge or cognizance the house of Lancaster, or a text H, t initial letter of this King's name, each crown with a royal diadem."

Hatton (1708) wrote: "The windows in th N. and S. aisles are painted with the Flower lis, Rose, Portcullis crowned, and anoth [window] at the W. end of each aisle."

Neale says: "At the present time but fe panes are thus ornamented, much of the gla having been broken or ruined while the chap was in a state of dilapidation. What remai has been distributed in the different windows Formerly, he continues, several of the pan had daisy-plants and others an initial H su mounted by a crown with a branch goi through it.

Painted quarries are now only to be foun forming a row at the top of the plain diamon glazing in the aisle windows; these have th crowned letters H. and R. alternately. Fig. is from some quarries in the South Kensingt Museum, which look as if they must have bee "collected" from Henry VII's Chapel when was being "restored." In the present glazin of the lower east window there are also son fragments of the old quarries; one is a near complete daisy plant design (*see* Fig. 6), second is part of a thorn tree and crow device (Fig. 7). Another is a crown whi looks as if it might be part of the por cullis quarry (Fig. 7). Doubtless, Keepe w literally true and every pane had its devic Compare the lower windows at King's Colle Chapel. These badges, devices and initials a delightful elements for repetition. The glazi was as fresh and interesting as the other par of the chapel and worthy of the brazen chant in its midst. Altogether, as William Mor said, the chapel was "the most romantic wo of the late Middle Ages."

THE ROYAL INSTITUT OF BRITISH ARCHITECT

PROPOSALS AGREED BETWEEN THE COUNC OF THE R.I.B.A. AND THE COUNCIL OF T SOCIETY OF ARCHITECTS FOR THE AMALGAMATI OF THE TWO BODIES.—The following membe of the Allied Societies' Conference, who we unable to append their names to the letter se out before Easter to members of the R.I.B. and signed by the Members of the Council a by members of the Allied Societies' Conferer have informed the Secretary of the Roy Institute that they desire to support the Cou cil's proposals:—J. Leighton Fouracre, Pre dent, Devon and Exeter Architectural Societ G. D. Oliver, Chairman Cumberland Bran Northern Architectural Association; D. Galloway, President Dundee Institute Architects; W. S. Purchon, Past Chairm Central Branch, S.W.I.A.; C. F. Ward, Cha man Eastern Branch, South Wales Institute Architects and Vice-President of the S.W.I. Frank S. Swash, Vice-Chairman Eastern Bran South Wales Institute of Architects; G. Vince Evans, Chairman Northern Branch, Sou Wales Institute of Architects; Mr. T. Alw Lloyd, Chairman Central Branch, S.W.I.A.

R.I.B.A. INTERNATIONAL CONGRESS ON A CHITECTURAL EDUCATION.—The Duke of Co naught has consented to become Patr of the International Congress on Arc tectural Education to be held in Lond from July 28 to August 1 next.

LONDON TRAFFIC.—II.

By MAJOR HARRY BARNES.

have seen that the Bill gives power Section 6 to attach conditions to of licences plying in the City of n and the Metropolitan Police District, ave noted what they are.

t one which enables the Licensing rity to refuse a licence to ply on an roved " route (that is, a route on which icensing Authority has defined as being n which a regular service may be run) e the bus is not suitably constructed or ed, would seem to carry with it certain ary implications. The Licensing rity must either lay down general rules verning the construction and equipment nibuses, or else specify them more par-ly. It would be unfair and lead to ry administration to leave bus con-rs in the dark on a point so vital, and t them to the expense of constructing a hat was afterwards turned down be-of reasons which might have been met constructor had been previously in-l. It is no doubt necessary to take pre-ns for public safety, but vigilance will e to be exercised to prevent these regula-stereotyping bus construction and pre-g improvements in it, and also in design. rue there is to be the right of appeal on oint, but that does not meet the case I aised.

further powers to be granted to the er make this point of still further im-ce. Let us see what they are. Let us e a bus constructor has got his bus , but with the condition that it must regular service; what follows? Within ned period, at the discretion of the er, he must deposit with the Licensing ity a schedule showing the " approved " on which he proposes to run his omni-hen he proposes to start and end each ne times of running and the number of ne means to run. On this being done, edule comes into force; but see what . The Licensing Authority must send of the schedule to every person running lar service on that route, and such may, within some defined period, fixed y the Minister, appeal to him saying: here. The Licensing Authority has more buses on the route we are on. We've been looking at the e, and we think that, considering the of buses these people are going to run, ght to give a better service, either all g or at particular times; or we think se people are going to run more buses re needed to give the service they " The Minister then, after hearing bus service and the new one, may, if s fit, amend the schedule.

is a curious provision, and, taken with the one already dealt with, seems to make the way of the new bus as difficult as possible. Mrs. Beeton the enterprising would-be cook, " First our hare "; the London Traffic Bill the enterprising would-be bus pro-" First get on to the road." The lf is to pass a test, and then the e " that the bus is to undertake is to test as well. In the first case the to sit in judgment on the bus is bly the Licensing Authority. In the ase the persons to sit in judgment on ervice " are his rivals on the route. e that in both cases an appeal to the is allowed; it is questionable if the should not go to a more judicial in fact, it would probably be decided chairman of the Advisory Committee other official of the Ministry of Trans-

hole of Clause 6 seems devised to make blishment of a bus service in the of London competing with that of .O.C. as difficult as possible. It is devised to prevent " surprise " opera-tions. The way it must work out is that the whole plan of operations of any concern that proposed seemingly to compete with the L.G.O.C. must be disclosed to that body down to the last gaiter button. Such a concern would have to have reasonable assurance that the type of bus it proposed to use was " suitable," that it would be allowed to ply on " approved " routes, and that the conditions of " service " were not so " onerous " as to make them impossible of performance. Its scheme would be submitted to the searching criticism of its rivals, and it is not easy to believe that under these conditions the establishment of any considerable competitive system to that of the L.G.O.C. in the streets of London is possible. That may perhaps be said to be a merit and not a defect to the London Traffic Bill. To carry the largest amount of traffic in the smallest number of omnibuses may be said to be not only in the interest of the L.G.O.C. but also of the travelling public. That contention, perhaps, need not be resisted, but to let it pass still leaves it possible to point out, and with truth if not with force, that the effect of the London Traffic Bill is, while leaving the appearance of competition in bus traffic in London, will make it in effect a monopoly of the L.G.O.C. I am one of those who believe that when a service has reached the point of only being economically possible under monopoly conditions, it should pass into public ownership. That does not necessarily imply public management, and it may be that the wisest course to follow would be to effect a combination of London traffice services under public ownership and private management. That will be a question for the Advisory Committee to consider, but it is well at the outset that the jargon of the London Traffic Bill should not obscure its effect, which is to make competition in bus traffic facilities practically impossible in London.

How true this is will be seen on passing to clause 7 of the Bill, where the Minister actually takes power to limit the number of omnibuses plying in certain London streets. Look at them. If you have a narrow street or a street with very dense traffic on it, or if there are alternative facilities for carrying passengers (*i.e.*, trams) on it or near it, or if bus accommodation on it is " excessive " (however that may be determined), then the Minister may declare it a restricted street. Having so declared it, he may then go on to say, " Buses may not ply here at all, or only at certain hours, or only for a certain number of journeys." Having said that, he may go on to select the favoured bus proprietors who may have enjoyed these restricted privileges, if any, sharing them out for more than one, and finally he may give the Licensing Authority power to enforce these regulations. Before he goes so far he must give notice to persons affected of his intentions, and must refer it to his Advisory Committee for their advice and report, but the final decision rests with him.

There can be little doubt that this " restrictive " action, together with that of defining " approved " routes, will be taken at once after the passing of the Bill, and there can be as little doubt that the result of both must be to transfer the L.G.O.C. from the position of being the practical monopolists to that of being the actual monopolists of bus traffic in the principal London streets. To make this comment is not to be taken as passing censure on the result of the Bill. It is a perfectly natural one. First come is first served. The L.G.O.C. have gradually built up a huge service greatly to the benefit of the travelling community of London, and presumably, and quite legitimately, somewhat to its own. It is possibly not within the realm of practical traffic politics to allow a riot of bus competition in central London, and if there has to be choice in this matter there can be no question where the choice must lie.

When all that is said and done, however, the fact remains that the London Traffic Bill will confer a new status on the L.G.O.C., and must make them the chartered licensees of London. The really practical attitude to take towards the Bill is not to resist an inestimable movement towards traffic control because it does not move quite in the direction that is desired, but to make it plain that the results of the Bill are clearly seen, and to insert provisions in it that are not yet to be found there to ensure that the privileges granted by licences issued under such conditions do not become assets of the company that at a later date may be required to be purchased back at enhanced values by the very authority that has created them. As a matter of fact, Clauses 6 and 9 want to be treated exactly as if they had appeared in a London and General Omnibus Company's Bill, and given exactly the same consideration and even-handed treatment, no less and no more.

Apart from the duties of the Advisory Committee in connection with the second schedule of the Bill, duties so considerable that they can result in no action until further Parliamentary powers are taken. The last important clause of the Bill is No. 10, which gives power to the Minister to make regulations for the purpose of relieving congestion and facilitating traffic in the London traffic area. The subject matter of these regulations are set out in the third schedule, and are of the most comprehensive kind.

They deal with the originating of traffic and determine the conditions under which goods may be collected, delivered, or otherwise handled; the limits of weight that may be carried; the routes that may be taken; the places where vehicles may stand, where they may turn, when, where and how they may cross each other.

Stopping or moving, turning or continuing, loaded or unloaded, whole or broken down, attended or unattended, from their goings-out to their comings-in, vehicles will be regulated and controlled by a ubiquitous, omniscent and omnipotent Minister. Not only vehicles, but animals—horses, cattle, sheep, and other animals—the harmless sandwich-men, those persons who wait for vehicles or to see Miss José Collins or anyone else in whom their heart delighteth—all are to be regulated by him. Well, Well. No doubt good sense will prevail, and the regulations will be wise and sensible, not irritating and aggravating, but leading to the comfort and convenience of all. So may it be.

Government's Housing Scheme.

The meeting of members of the House of Commons, which Mr. Wheatley arranged recently in order that they might discuss with representatives of the building industry who signed the recent report any points they might desire to raise in connection with the housing scheme, has been postponed until May 12.

Messrs. Barkers' New Premises.

Atthe invitation of Messrs. John Barker & Co., Ltd., a visit recently of architectural students (55 in all) to the new store now being erected in Kensington High-street, was arranged. Mr. H. L. Cabuche, architect to the Company, introduced the students to Sir Sydney Skinner (chairman), Sir John Anderson (Messrs. P. & W. Anderson, contractors), and Mr. Steinberg (Considere Constructions Co.). Sir Sydney Skinner explained his views on the lay-out of the new store and the various methods by which it would be connected through subways to the different branches and to the dock and administrative quarters. The original intention was to absorb No. 1 Palace Green, but it was felt necessary to retain this building as it was a specimen of the late Philip Webb's work. Sir Reginald Blomfield was asked to design the exterior and to collaborate with Mr. Cabuche, who was responsible for the planning, construction and the interior of the premises.

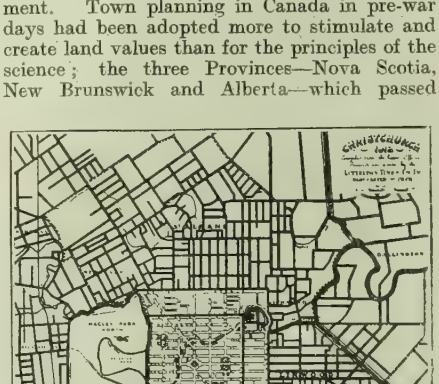
TOWN-PLANNING CONFERENCE AND EXHIBITION

The decision of the Town Planning Institute to hold this year's annual conference at Wembley was a good one. And the exhibition which has been arranged in the Palace of Arts will help to arouse popular interest in town planning and the larger and really more important question of regional planning.

One has, however, two regrets: Firstly, that the Exhibition in the Palace of Arts is only accessible on payment of another sixpence and, secondly, that an attempt to visit it entails unnecessary and irritating delays owing to the regulation compelling visitors to deposit hats, sticks and overcoats in an entirely inadequate cloakroom.

We noticed, even on the first day of the Conference, that many intending visitors abandoned the attempt. This is the more to be regretted because the exhibition itself is well arranged, and certainly the best we have yet seen of its kind.

The question of the papers which form the business of the Conference is a difficult one; it may be said that the subjects should have been selected with more regard to the outside and popular world who are not town planners, architects, Town Clerks, Borough Engineers, or otherwise qualified as "delegates," but it may be objected by those who know that even had a "popular" programme been possible it would have failed to attract the ordinary visitor, and would not have had the same interest for the official delegates.



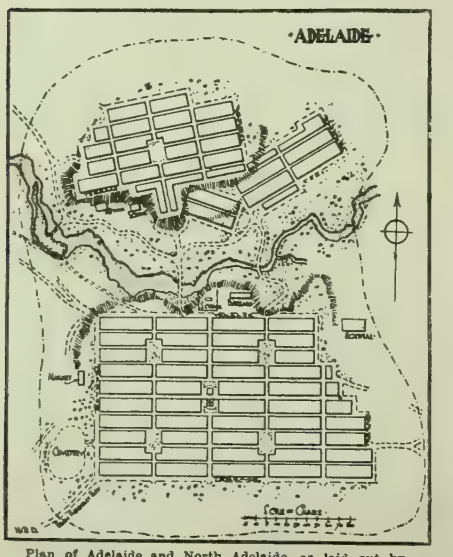
This is probably an accurate view, but if we admit this is so it certainly demonstrates the fact that the chief need at present (and for years to come) is, not so much to preach to those who are already converted, as to devise some means of interesting the ordinary citizen and proving to him that town planning is as much a matter of vital concern to him as is housing.

We wish, for instance, that representatives of the big firms from the adjoining Palace of Industry could have been invited to attend the Conference, and take part in the discussions.

The proceedings opened with the inauguration of the exhibition by the Right Hon. John Wheatley, M.P., Minister of Health, who in the course of a brief speech referred to the importance of Regional and Town Planning in securing better conditions for the people of this country and the Empire generally.

At the afternoon session the chair was takenby the Rt. Hon. Sir Joseph Cook, P.C., G.C.M.G., who said he thought it was particularly fitting that this conference should be held at their Empire Exhibition, for Town Planning was a democratic idea. The town planner was a missionary of sunlight and fresh air, and one whose object was to improve the conditions under which the peoples of the Empire lived; therefore he thought they were real missionaries of Empire. He ventured to suggest that their aim should be not the creation of terraces of identical appearance, but to preserve the individuality of the home.

The first paper, by Mr. Thos. Adams (who was unable to be present), on "Town Planning in Canada," was read by Mr. Thompson, who said Mr. Adams attached great importance to rural town-planning as opposed to urban development. Town planning in Canada in pre-war days had been adopted more to stimulate and create land values than for the principles of the science; the three Provinces—Nova Scotia, New Brunswick and Alberta—which passed



Plan of Christchurch, New Zealand.

town planning Acts prior to 1914, adopted the English Act of 1909 almost as it stood and, as subsequent experience had shown, without sufficient consideration of local needs and conditions. It was probably accurate to say that in the immediate post-war period town-planning had been prosecuted with most vigour in Canada than anywhere else. Special opportunities, such as the establishment of new industries in Newfoundland, had been properly used, and town-planning experts called in to plan the new towns which had thus come into being. Similarly the explosion, which in 1917 had destroyed a large portion of the city of Halifax, had provided an opportunity for replanning the city, which had been used with excellent results. In Canada to-day town planning was almost entirely in the hands of the provincial governments and local authorities, and although this had certain advantages, it was a misfortune that the withdrawal of the Federal Government from active participation in town planning had terminated the activities of the Commission of Conservation; since the war attention in Canada, as in other parts of the Empire, had been concentrated on housing and site planning, and there was a tendency to switch over from the gridiron type of planning to that following natural features and contours.

An important result of this, which had been emphasised in a recent lay-out, was that no such scheme could be successful without some form of architectural control over the buildings to be erected.

Mr. Lanchester then read an abstract from his paper, "Town Planning in India," and said the enormous difference in the character of different towns in India was not realised in this country.

Plan of Adelaide and North Adelaide, as laid out by Col. Light, 1837. (Both town and suburb surrounded by park lands.)

Plan of Adelaide, 1837.

Dunedin, N.Z., laid out with "town belt" of public land surrounding the town

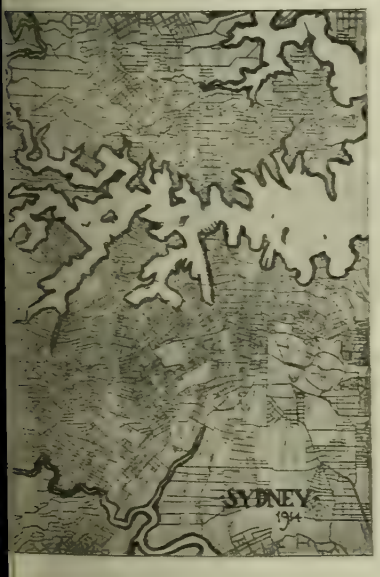
Plan of Dunedin, New Zealand, 186

What they had to consider could perhaps illustrated by recording the fact that there w no fewer than sixty languages (as apart fr dialects) in India, and almost as many ra differences and styles of architecture. Perh the most marked difference was that betw the cities and towns of the interior and the s ports, which were "Colonialised," and had m European characteristics than the other tow Town planning in India was not easy, chi because there were so few people who wis to put up good buildings. One of the c difficulties encountered was due to the syst of irrigation, common in the low-lying distr of tanks connected by canals. These having many cases fallen into a decayed state w filled in, but no provision was made for deal with the water which collected as a result of heavy rains, often with serious results. One the problems of the town planner was the storation or diversion of these systems irrigation.

Town-planning work in India started fro different basis from our own. In England it regarded as primarily the organisation of n developments, whereas in the East it star from health measures dealing with insanit and over-crowded areas. Before the initia of schemes a good deal had been done in clea plague-ridden districts and opening new str while plague camps were a recognised sani measure, but apart from these, rehousing not received adequate consideration, with result that new slums were constantly grow up in lieu of the old. Thus it became obv that a more comprehensive programme demanded and this naturally led to one dea with the town as a whole.

The earlier clearance schemes were of m too ruthless a nature, unduly destructive of property and of the character of the to roads being cut straight through conge areas, without regard to existing sites street alignment. This was in large mea due to the fact that the operations were in hands of civil or military officials wit special training in this type of work. M over, extensions were laid out from " designs " on the same rectangular lines reg less of site and levels so that they were needlessly extravagant. When these de of system began to be appreciated, ex advice was sought and steps were taken to se less haphazard procedure.

Mr. W. R. Davidge, in a paper on "T Planning in Australia and New Zealand," that the chief thing to bear in mind was difference in the climatic conditions; wh in England we wished to get all the sun possible, in Australia and New Zealand problem was rather to provide shade and air. A serious aspect of the problem, fro point of view of the development of countries, was the fact that nearly half population was an urban one; this pro was being solved, he thought, by the settlement scheme. Probably no other co in the world had been so thoroughly and ently town-planned as Australia. Ade with its encircling belt of park lands, and Sy were examples of this pioneer work. In l out towns what usually happened was th in Melbourne, the main roads were ma chain (66 ft.) or 1½ chains (99 ft.) wide Melbourne the back streets were laid down



Plan of Melbourne, 1855.

th of 33 ft., but now these had become, ny cases, important streets and this width o longer adequate.

thought the genesis of the grid iron type n was due to the influence of the surveyors ruled the land in more senses than one." st these were laid down on lines governed me natural features, such as rivers, &c., ter the north and south lines were followed. wished to congratulate the town of Sydney ving the most excellent service of rapid transport, which was more efficient than and transport could hope to be.

the big cities in Australia were faced with ame difficulty of a multiplicity of local rities, and were trying to solve this in ame way as was being done at home by rences which he hoped would lead to the on of joint Town-Planning committees ifferent regions.

th regard to New Zealand all the large towns ally had belts for park lands, but unfor- ely some of these had been sold or built This, he thought, demonstrated the not only for creating such belts, but for ving them. In New Zealand it was cally impossible to have a curved street, se the compass bearings of all streets o be given before they were approved. ew Zealand, the banks of all rivers and ns were preserved and could not be built for a width of 1 chain on each side; was also a special department set up by lovernment to preserve natural amenities.

Plan of Sydney, 1914.

Discussion.

Sir Joseph Cook, who opened the discussion, said he did not think Mr. Davidge had missed one of their mistakes or weak points.

Mr. Taylor (of Sydney) moved the vote of thanks to readers of papers, and said that town-planning started in Australia about 10 years ago, and was inspired by the work done in England. Mr. Taylor described the development which had taken place in Australia and concluded with a brief reference to traffic congestion in London.

Mr. Miriams (of Bombay) seconded the vote of thanks and referred to the special difficulties and vastness of the town-planning problem in India. He expressed the view that the problem could only be satisfactorily solved by town-planning, even the smallest villages, and subsequently controlling any extensions that occurred.

After some further discussion, the proceedings terminated with a cordial vote of thanks to Sir Joseph Cook, who briefly responded.

EXHIBITION NOTES

THE ARTIST-CRAFTSMAN GROUP.

We welcome such exhibitions as this, which are rather sale rooms for a very human sort of merchandise, a direction for craftsmanship away from its more detached and artificial atmosphere to one taking its place in the community on the general level of life, and deserving of support because it tends to improve it. But though allowing for the natural impulse to state a good case for themselves—which is really not needed—the statement of this group is perhaps open to the criticism that it does not assist the claims advanced through it which are better substantiated by the work itself. It seems difficult, however, for any movement of the kind to avoid a challenge to other directions of work, and the habit of contrasting their work to the detriment of other points of view is rather beside the mark. The catalogue informs us that "they follow the tradition of the rank-and-file mediæval craftsman, and prefer to make simple and comparatively inexpensive pieces for the home than elaborate demonstrations of technical skill for the collector's cabinet or the museum"—but the work of these aforesaid mediæval craftsmen is what largely fills our museums, and it is not technical skill or elaborate production that is to be gainsaid, if bestowed for a worthy purpose.

Coming to the work shown by this group, it is seen to be of considerable merit, in many cases very sound in direction and full of vitality—though an exhibit of metal work appeared to us rather trivial. The Oxshott hand-made pottery of Denise and Henry Wren is good in colour, has that agreeable quality of surface that we associate with mediæval pottery, and is full of variety and atmosphere. If a criticism is to be made, it lies in the too easily extended variation of shape without the searching for ultimate form which grips us by its inevitable character. The failure of hand-made pottery is not so much in craftsmanship at the present time as in significance of design, and a more humble study of ancient examples would correct this. Craftsmanship is not enough; we must reveal also what cannot be taught. The facilities of the former are comparatively easy to reach, but there is also required the searching through treatment for that kind of beauty which in the best is intuitive and transcends method. These remarks no doubt apply to all art expression; but with these new handcraft industries, with a fine future, we believe, before them, a high standard of form and treatment rather than exuberance is their chief requirement. Because we are reaching a better craftsmanship, we must not put the first last or forget that a deepened beauty will react on craftsmanship to further its resources. In this respect there is so much to be learned from the best ancient examples that we should like to see this new handcraft work of such excellent promise founding itself more evidently on traditional example, "writing over the old the spiritual expression of the new."

The exhibits of the hand-weaving industries, which are amongst the best of the crafts shown, should be seen by all who desire beautiful fabrics. The Distaff Cottage Industry, the weavings and embroideries of Miss Clary Hahr, Kensington, and those of May Holding, Sutton, near Pulborough, are on the whole excellent in colour and texture; while a certain distinction rests over the materials with which mass production cannot compete. These beautiful materials, so adaptable for dress or furnishing, can be obtained at prices which are in no way exceptional, and we noticed as of charming quality some coloured linen materials on Miss Hahr's stand at 4s. a yard.

These beautiful handcraft materials effect a most valuable influence on ordinary manufacture, which, quick to adopt any attractive quality to sell the goods, is seen to receive an impulse from such, and the workers in these industries are doing a public service in the influence their work bestows over ordinary mass production—though we fear the manufacturer is more ready to take advantage of such example than to acknowledge its indebtedness.

Hand-wrought jewellery of considerable charm in design and craftsmanship is shown by Miss Dowie Nossiter: stones are well harmonised with their settings and the proportions rightly felt, while there is seen the influence of traditional example preserving the work from any "new art" tendency such as is seen to haunt some modern work of the kind. The advantage to the buyer of jewellery of this more personal craftsmanship is so great that it is difficult to understand that anyone having the choice between it and the ordinary commercial work could hesitate for a moment, and the prices at which the work is sold are extremely moderate. Miss N. Casella's coloured table-glass has merit in that the design, though not of much originality, shows good taste, and the patterns are well distributed. We think, however, that there is too much yielding to the easier, but less intrinsically good results of opaque colour. There is a loss of the glass quality in this, and it misses the charm of translucency. The craftsmanship for this is no doubt more difficult, and the loss in firing considerable, but the glass which does not retain its clearness under the colour has suffered a loss both to the colour and the glass, and it should be the aim of the craftsman to overcome this if the finest results are to be secured. Space precludes from mentioning other examples of lacquer printing, etc., but the little exhibition is well worth a visit as a part of a movement which is distributing its activities in the country, much to the advantage of our industries—because it develops that humanising influence over work, and tends to become a leaven to more commercial production. The exhibition, which is held at Committee Room "D," Central Hall, Westminster, will remain open until May 10.

Manchester Society of Architects.

The annual general meeting of the Manchester Society of Architects was held on April 30 in the Society's rooms. The retiring President, Mr. Francis Jones, F.R.I.B.A., cordially welcomed his successor in office, Mr. Arthur J. Hope, F.R.I.B.A., one of the architects for the recent work at the Manchester Royal Exchange. The result of the election of officers for the Session 1924-5 was announced as follows:—

Council.—Fellows: Messrs. W. S. Beaumont, A. C. Dickie, A. W. Hennings, P. Howard, Francis Jones, Paul Ogden, J. H. Sellers, Isaac Taylor, Dr. P. S. Worthington. Associates: Messrs. H. W. Cruickshank, G. B. Howcroft and W. C. Young.

Hon. Secretary.—Mr. John Swarbrick.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

The New Housing Bill.

Mr. Wheatley informed Sir L. Lyle that he was not at present able to state when the second reading of the proposed Housing Bill would be taken; in accordance with the usual practice a White Paper would be circulated before the Financial Resolution was discussed. He would introduce the Bill with all possible speed.

The Subsidy.

Mr. T. Thomson asked the Minister of Health whether in order to carry out their housing programme, the Government were considering schemes which would impose on local authorities an additional burden of 10d. in the £ on their rates; and, if so, if he would say whether they had had regard to the fact that in those areas where houses were most needed rates were already high, and consequently an addition of 10d. in the £ would effectually deter the erection of more houses; and if they would reconsider this part of their scheme.

Mr. Wheatley said that the question of the housing subsidy was being discussed with representatives of the local authorities, and he would suggest that the Hon. Member should reserve his point until he was in a position to lay the Government's proposals before the House.

Lieut.-Col. Horlick asked the Minister whether he was aware that Sir Theodore Chambers, chairman of the rents tribunal, recently stated in his opinion that the Government housing subsidy was at present being given unnecessarily to some 70 per cent. of the occupants of Council houses; whether he had obtained the advice of this committee in framing his new housing policy; and whether he had considered the suggestions made by the chairman of the rents tribunal that a subsidy should be given based on the number of children in a family.

Mr. Wheatley said he had seen a report of the remarks made by Sir Theodore Chambers to which the hon. member referred, and although he was unable to adopt the particular suggestion made by him as to the basis of subsidy he was considering generally the views he expressed.

The Building Trade Dispute.

Sir Kingsley Wood asked the Minister of Labour whether he could state the nature of the present dispute in the building trade, and whether he was taking any steps to safeguard the Government housing operations.

Mr. Shaw said that following negotiations between the employers' and workers' organisations the latter were taking a ballot of their members. In the circumstances he did not think that it was desirable for him to make any statement on the matter at this moment.

The 1919 Act.

Mr. Greenwood, Parliamentary Secretary to the Ministry of Health, informed Sir G. McCrae that on April 1 173,620 houses were included in tenders approved under the Housing, Town-Planning, &c., Act, 1919. Of these, 169,526 had been completed and 3,760 were under construction. The number of houses completed with the aid of the grant under the Housing (Additional Powers) Act, 1919, was 39,184.

Foreign Materials.

Mr. T. Thomson asked the Minister whether it was the considered policy of the Government that no foreign manufactured goods should be used on houses built under Government subsidy, as advocated by the committee of building materials, manufacturers, and suppliers presented to Parliament.

Mr. Wheatley said that he had noted the opinion of the Building Materials and Suppliers' Committee to which the hon. member referred. The report of the Committee was under consideration by the Government and he was not in a position to make a statement at the present.

Price of Bricks.

Mr. Hardie asked the Minister of Health if he would state what had been the increase in the price of bricks for house building since the present Government took office.

Mr. Wheatley said he would refer the hon. Member to the monthly reports of the Committee appointed to survey the prices of building materials.

Mr. D. G. Somerville: Is the right hon. gentleman aware that there has been a fresh advance in the price of bricks this week?

Mr. M. Jones: Is he aware that the Powell Duffryn Company, one of the richest and one of the greatest producers of bricks, sent up their price of bricks by 5s. per 1,000 six weeks ago?

Mr. Wheatley: I can only say that all the information available on the matter has been published in the reports.

Magnolite.

Sir H. Brittain asked the Minister of Health whether his attention had been drawn to a new building material known as magnolite, the invention of Signor Paulo Marpillero, by means of which it was claimed that eight-roomed houses could be erected in a week at an approximate cost of £350 per house; and whether, in view of the housing shortage, he would have immediate investigation made as to the possibilities of this Italian invention.

Mr. Wheatley said his attention has been drawn to the material named by the hon. Member. Samples had been examined and as a result he was advised that this material did not promise to be suitable for erecting dwelling-houses in this country.

Concrete-Block Houses.

Mr. Hardie asked the Minister of Health whether he could now make any statement upon the investigations made regarding concrete-block houses in Clarkston, Glasgow.

Mr. Adamson, who replied, said the concrete-block houses in question had been examined on behalf of the Scottish Board of Health, and a favourable report had been received of their construction.

Empty Houses.

Sir L. Lyle asked the Minister if he would, for the information of the House with his housing proposals, give statistics of the empty houses built with or without the Government subsidy which were now held for sale throughout the country and not for letting; and whether he had considered the possibility of dealing in some way with this practice.

Mr. Wheatley said that as the number of empty houses held for sale was constantly fluctuating he was of opinion that the value of any statistics, if obtained, would not be commensurate with the labour and expense involved by their compilation. The point referred to in the last part of the question was at present under consideration.

Government and Evictions.

In reply to Sir Kingsley Wood, who asked whether it was the intention of the Government to bring forward any further proposals for legislation relating to evictions or rent restrictions, the Prime Minister said that the Government had not, since a majority of the House declined to allow their proposals to go to a Committee, decided to bring in any further proposals for legislation relating to evictions or rent restrictions.

In answer to Captain W. Benn, the Prime Minister said that the Government had come to no decision as to the Distressed Tenants Bill.

Prevention of Evictions.

The Liberal Prevention of Evictions Bill has passed the Report stage and has been read the third time.

Sir Kingsley Wood moved a proviso that in a case where either the tenant or the landlord was an alien, if the Court was of opinion that the hardship in each case was equal, the benefit of the doubt should be given to the Britisher. Liberals and Labour members, however, opposed the amendment, which was rejected by 185 votes to 140.

The Report stage was then concluded and the Bill read the third time.

THE ARCHITECTS' A SURVEYORS' ASSISTAN PROFESSIONAL UNIO

At a well-attended meeting of the A tects' and Surveyors' Assistants' Profes Union, held at Olympia on April 25, M Topham Forrest, F.R.I.B.A., Architect London County Council, speaking upon Modern School and the Future Race," in the Metropolis there were nearly public elementary schools, in which 70 children were being taught. There sixty-one central schools with accommod for over 20,000; sixty-seven secondary s attended by 31,000 boys and girls, and 260 technical schools and evening insti with 200,000 pupils, all of which were tained or aided by the London County Co

The subject divided itself into two p (1) the school of to-day and (2) the t to-morrow.

The first thing the School Board req when it begun its work was the provisi suitable buildings. At that time church were commonly used as schools, it being sidered that any building was suitable fo purpose. To-day in London there were school buildings which outwardly sugg their purpose. Spacious playgrounds, s halls and classrooms, proper light and ven tion, were obvious everywhere

Each senior scholar had 10 sq. ft. of space allotted, and 9 sq. ft. was given to infant. The window glass was equal to fifth of the floor space. Cleanliness was evi everywhere. In secondary schools the space was from 16 to 18 sq. ft. per schola

The schools were designed not only for child but for the teacher. The number children now allowed per teacher did not ceed sixty, but the London County Cou considered that too many, and at a cost five million pounds it had provided for forty scholars in the senior department forty-six in the infant department under master.

The architect must also play his part suiting the schools for the various subj now taught the children. In the second schools the training might be described as human, (2) physical, (3) practical, and social; and in designing such schools the ar tect must bear these in mind. Thus, co-ordination between the various departm the London County Council might well ch to have established a unified and efficient sys of local education.

In rural districts little progress had made, but the first great Act of 1923 steadily bearing fruit.

It is well to remember that the Lo County Council gave £75,000 each year tow the work of the London College, and acti maintained a school of the University, nam the London Day Training College, at a co £8,000 per annum, and gave grants in to about the sum of £14,000 in London, Ox and Cambridge.

At the new housing schemes of Belling and Roehampton, elementary schools had designed on the pavilion type, somewhat the lines of sanatoria. The design had made so that the buildings, by becon affected by new ideas, might be readily alt in size or even demolished at a minimum The extensive playgrounds were worth not

Not long ago gymnasia and extensive pla grounds, etc., would have been consid waste of money, but to-day they regarded t as essentials. The architect, with the tea and the doctor, studied the best method living, health, ventilation, and sanitation that the child's environment should be heal sunny, and cheerful. Medical inspec rooms were another feature of the mo schools.

Something more than learning must be gi the scholars. They must have moral quali which were essential to self-control; they m learn to keep their tempers; and it was these directions that games had their valu

LAND VALUATION AND RATING

a very serious hindrance to any pros- the solution of the housing difficulties addition to numerous Bills dealing with estriction a hint should have been given Budget statement that land valuation e revived as soon as possible, and that te Bill should also have been introduced we understand, proposes that the rate- lue of property shall be its annual value hat is the higher, and that unoccupied y shall be rated on some new basis. ve not at present the terms of this Bill us, but whatever may be the ultimate ls both as to land valuation and rating, be self-evident that what is required case of a depressed industry is a cer- and not continued threats of increased s.

fact is clearly recognised in connection ther schemes for taxation or proposals ference or protection, as the cry is at aised that the cost of certain articles raised to the consumer; but in connec- th housing the fact never appears to be l that at a time when houses are in l, yet the cost is prohibitive, every sug- of taxing land or increasing the of the rates must hinder production o render the product more costly. The es of such schemes at such a time almost appear to think that houses can t in the air, whereas past experience wn that when land taxation is put into both the proposed houses and the revenue to be derived from land taxa- appear into thin air or are Will-o'-the- Confidence and certainty are the two s which are most essential in relation housing of the population, and there n one continuous attack on both these s of late years.

the cost of building which is the serious which has to be considered at the time. The demand for houses would case have tended to put up the price es even if the cost of construction had d as it was; but the increased cost truction, coupled with the increased , has made the price of houses so pro- that some form of State aid has been ecessary in the case of working-class s, and in the case of higher-class a large part of the population cannot ger afford proper housing accommoda- t is not the price of the land that the difficulty, but the cost of labour lding materials; for the land is the terial of the industry, and although e only bears a small proportion to the he building as a whole, any taxation land can only increase the cost of

lis, therefore, a suitable time to taxing the land and increasing the of the rates on property owners? A on one hand and taxation on the other a contradiction in terms. What has imed at is cheapening the cost of but the very mention of such schemes bove must enhance their price, as it onfidence and prevents any enterprise art of private builders who have not the Lumsden case.

as regards rating, so long as Rent on is in force it is obvious that no ory principle can be arrived at in for in Roberts *v.* Poplar Assessment ee (*The Builder*, April 14, 1923) it by the House of Lords, reversing the Appeal, that the restrictions imposed by the Rent Acts were not to be o consideration in the assessment of for rating purposes.

y there seems a prospect of the class dwellings having to be solely at national charges by the munici- palities, and private enterprise has been driven from this field; but it can hardly be seriously contemplated that the housing of the whole population should be nationalised. It is, however, quite certain that a larger proportion of the population is every day finding it more difficult to afford housing accommodation, and if private enterprise is further to be stifled and increased burdens of rates are to be put upon such sections of the population as at present are housed, the problem will become even more serious and increased State aid will be demanded.

As it is, landlords are restricted in the rents they can obtain and at the same time are paying rates for those who are being housed at less than economic rents and supporting unemployment, and a halt must soon be called. After certain historic wars there is a text which seems to bear a different application in these days—" and the land had rest forty years "—that is a text which we can commend to the notice of the Government at the present time, for it is not yet a year since the necessity of registration under the Finance Act, 1909-10, was abolished.

INSTITUTE OF BRITISH DECORATORS

Wall Paper Design.

At a recent meeting of this Institute at the Painters' Hall, Mr. Henry G. Dowling lectured on this subject. In the course of his remarks he said that one of the wallpapers they were exhibiting, dated 1769, was among the earliest to be produced in this country, and like another recently printed, was from an original Chinese painting. It was evident they were soon to witness a reaction on the part of the public in favour of patterned walls. Immediately after the war there had been a demand for relief from drabness, and this relief had been found in extreme design and riotous colour. Nothing in those days had seemed too extravagant in colour arrangement or too wild in motif; freakish and bizarre effects had been the vogue. This phase went out completely, and was followed by a demand for simplicity in colour and design. The average home owner would not live between bare walls; he found added warmth and comfort when those walls were covered with a carefully selected textured or patterned wall paper. Wall paper manufacturers had met the demand for plain effects by producing all manner of pleasing textures, so that there was to-day a choice of papers to satisfy even the most insistent advocate of the plain wall. At the same time narrow borders had become the vogue, but these had now become more pronounced; they were more definite in colour and bolder in design.

The lecturer told the story of the introduction of wall papers into Europe from China early in the seventeenth century, though the Chinese, he said, never used them as wall papers, but rather as paintings on paper. Wall paper as wall paper was really a European development of the vogue created by the importation of the Chinese paintings. The abolition by Mr. Gladstone in 1861 of the paper duty had increased the output and popularity of wall papers, and William Morris had devoted much attention to their design, and had proved by good patterns, right in character and selection of colour, that wall paper designing was worthy of the attention of the best artists. Some of Morris's designs were among those exhibited in the hall, and though the colours were neither few in number nor low in tone, yet they were combined with such skilful judgment that the harmony was perfect. Many of Morris's wall papers were so reticent in colour that they functioned readily enough as backgrounds to decorative accessories. All possessed permanent beauty. In designing he ever kept before him the limitations of the medium in which he sought to express himself, as well as the purpose or use. Such patterned wall paper was again coming in—old designs were being revived and new designs prepared to meet the appreciative reawakening for design and colour. Even the Chinese hand-painted and landscape papers were reappearing—evidence surely that the present generation was inclining to the view that given good line and colour, wall papers were good decorations in themselves. Nevertheless, however high their intrinsic merits, wall papers should be considered in relation to the objects in proximity to them; the function of the room in which they were used should be considered, its method of lighting, its architectural features and general immediate surroundings. Some rooms were required to give the feeling of rest and quietness, others of gaiety and motion.

Of methods of treating, these could be as varied as the ingenuity of the decorator could devise. If a plain or textured paper was to be used, this might call for a border, and this could be treated in a variety of ways. The border could be used to make each wall one large panel, or each wall into a series of carefully proportioned panels. Or, again, the border might be placed below the picture rail only, or with a second border the same distance above the skirting board. It was in this province that they could do with paper what could not be done so well with plain paint; the too lofty room might be apparently lowered; the low ceiling raised; the narrow room made to appear wider, and the room that was too wide narrowed. In all panelling work it was imperative that the decorator be acquainted with the intended disposition of the furniture. The greatest scope was given to the enterprising decorator by the papers which allowed of motifs being cut out from them to build up decorative schemes, such as the apartment would allow and his fancy dictate.

Speaking of colours the lecturer said that yellow was particularly useful for lightening dark rooms—colours composed of a considerable amount of yellow were all luminous and light giving. Blue was retiring and soothing in its influence. In some shades it was cold, but in all it gave spaciousness. Reds of the vermilion order were exciting. They had a tendency to make walls appear nearer, and thus apparently to dwarf the size. All reds had a quality of warmth. Orange was expressive of heat, and if too large a proportion of red entered into its composition it became irritating. Green was restful. Purple was regal, but the most retiring of all the rich colours. Certain colours were associated with certain periods, and if a period decorative scheme was in question should be followed. Even among the best decorators there was divergence of opinion regarding colour and colour-combination, strong colour being a delight to some and a nausea to others. But in every case there was no necessity for white and drab schemes.

BUILDING OPERATIVES

The building operatives have rejected, as a result of the ballot, recently taken, the employers' offer of ½d. an hour increase. The figures are as follows:—

(1) In favour of the employers' offer..	13,462
Against	104,001
(2) In favour of further negotiations..	91,735
Against	34,719
(3) In favour of a strike if negotiations prove abortive	94,114
Against	32,483

NATIONAL FEDERATION OF HOUSE BUILDERS' ANNUAL MEETING

THE annual meeting of the National Federation of House Builders was held at the British Empire Exhibition on Thursday, May 1, Mr. H. R. Selley (Streatham), the President, in the chair. The morning session was occupied by the formal business of the Federation, at which Mr. Selley was elected President for the ensuing year, Messrs. G. F. Darbyshire (Manchester) and A. J. Belton (Sheffield) Vice-Presidents, and Mr. G. H. Brown (Manchester) Treasurer. After some discussion a resolution was adopted that the Federation should approach the National Federation of Building Trades' Employers with a view to arriving at an agreed standard rate of pay for day work labour, reserving intact the well-established customs of the house building trade to establish systems of payment by result. In the discussion it was pointed out that the position of the Federation as a national organisation could only be maintained by its taking its place as a recognised negotiating body and making its influence felt in the consideration of the Government's proposals.

The Committee's Report on the work of the past year was as follows :—

"Your Committee has again to report a year of progress in the work of organising the house-building trade. Progress is necessarily slow owing to the continued impossibility of building houses for sale to the investing public. The maintained cost of building and the threatened extension of control of rents have combined to postpone any great activity on the part of our members and operations have still been confined to building for sale to the occupying owner.

"Since the last annual meeting the Federation has appointed an Assistant Secretary, who devotes his whole time to the work of the Federation and the London Association, and this has resulted in increasing our membership in London to double the number of members. We have also in hand the formation of affiliated associations in many parts of the country where we have no representation, and associations have been formed or are in process of formation in several important centres.

"The Federation has taken an active share in the work connected with the Housing Act, 1923, which was passed in August last, and which revived the principle of a subsidy to private enterprise. The Act was very largely based on the lines we had advocated, and it offers an opportunity such as the private builder has not had since the war of building for sale to the owner-occupier. It is gratifying to record that from the passing of the Act to March 12 last certificates for the grant of subsidies to private builders were issued for 70,000 houses, during this period the Government grant to local authorities for municipal schemes was authorised for 39,381 houses. We have carried on an unceasing agitation for an efficient grant to be made by all local authorities, and wherever we have been well organised we have secured very favourable terms for our members. In other districts where we are not strongly represented the local authority has not given grants on favourable terms and little progress has been made.

"The new Government is pledged to provide houses and is prepared to adopt some drastic scheme to encourage the building of working-class houses. A committee of builders and trades union representatives has drawn up a very strong report, which, if adopted by Parliament, will give a preference in both materials and labour to approved building schemes, and as there will be a considerable shortage of both commodities it is very probable that only approved schemes will receive assistance in the supply of labour and materials. While your committee is strongly opposed to all forms of control, facts must be recognised, and proposals will be laid before the members at the annual meeting to meet the position by urging the Government to confine the local authorities' own schemes to the smaller type of houses and to grant subsidies freely to those who can buy their own house. The Federation will spare no effort to ensure that all housing schemes for our members, whether subsidised or no, shall receive a fair share of the available labour and materials.

"Your Committee after very careful consideration has decided to recommend the members at the annual general meeting to agree to join with the other organised bodies of employers in adopting a definite scale of wages and conditions of labour. As a great National Federation we have hitherto carried on without any recognised rules as to wages, but a large number of our members are of opinion that we must make a stand against the growing demands of the operatives, both official and unofficial, for higher rates of pay. Your Committee feels the difficulty of the situation, and in all negotiations will carefully safeguard the rights of our members to maintain the old established custom of the trade to pay their workmen in certain cases by some system of payment by result. An important resolution bearing on this matter will be submitted to the members at the annual meeting.

"Your Committee have again to refer to the financial position of the Federation, and to urge every member to pay both subscriptions and levies promptly. The financial calls on our members are extremely moderate, and the liability of the Federation to carry on its work in the interests of every house builder entitles it to the best financial support of every one concerned."

On opening the afternoon session, Mr. H. R. Selley dealt with the recently issued report of the National House Building Committee on which he had sat as a representative of the Federation. The report was an honest endeavour to formulate a programme which would provide houses, and the Federation had taken a share in the work of the Committee, because it represented the builder who had the experience in housing the people. It was said that the house builder could not build the houses that are required; and unless some encouragement was given to him that was true. The encouragement should be given by helping the man who was prepared to buy his own house—the man who would pay £800 for his house and solve his own problem—that was the man who should receive recognition and assistance in the new housing scheme. It was impossible to carry out a great national housing scheme unless there was a sufficiency of materials, and the experience of all builders at the moment was that there was a great shortage of materials of all kinds. There was a famine in bricks in London and the south, and he understood that all the brickworks were working full time and producing the maximum quantity. The House Building Committee had the assurance of the manufacturers that they could produce enough materials for an extensive housing programme, but he thought there ought to be something more definite than an assurance before the Government launched its huge schemes. The proposal for a guaranteed programme for a long term of years was the proposal of the operatives' representatives on the committee, who made that a condition before they agreed to the extension of the apprenticeship system to provide the extra labour; they also had tried to secure a full week's pay in all cases, and he was glad that Mr. Wheatley had shown a firm front on that point, for no builder could estimate what a job was going to cost if he had to pay for "wet" time. Mr. Selley proposed the following resolution :—

"That the Federation is prepared to loyally carry out any housing policy adopted by Parliament which is calculated to encourage house building and which does not prejudice the ultimate restoration of housing by private enterprise."

Mr. C. H. Oldham (Manchester), Past President, in seconding the resolution, said that they were prepared to help the Government to the fullest extent of their powers. The Federation had made representations to all Mr. Wheatley's predecessors for the past seven years, and remembered Mr. Hayes Fisher expressing then Government's intention to build 300,000 houses during the first year after the war. He also remembered telling Mr. Hayes Fisher that as the maximum number of houses ever erected in one year, when labour and materials and money were plentiful and cheap, was about 100,000, it was ridiculous to say they were going to build three times that quantity when materials was scarce and dear, the trade denuded of many of its best men, and materials were doubled in price. The only way to a solution was to restore confidence in housing, and when confidence was restored, the house builder would build the houses. The money existed for housing and would become available when it was a business proposition.

The resolution was carried.

Mr. A. J. Belton (Sheffield), Vice-President, proposed: "That the State assistance for housing be extended in the following directions: (*a*) To assist local authorities in the erection of working-class cottages of the smaller type to be let to tenants; (*b*) To assist private builders by making it a commercial proposition for them to submit schemes where numbers of houses could be built to be let at a rental; (*c*) To assist thrifty working people to purchase their own houses by means of the subsidy and loan on the lines of the Housing, &c., Act, 1923." He suggested that a scheme could be devised to take advantage which gave a larger subsidy for the smaller house, for it was the man who had little capital—the thrifty working man—who deserved the greatest assistance.

Mr. J. W. Comben (Wembley), in seconding the resolution, gave figures showing that from a national point of view the subsidy was very much more economical than public ownership. He said he had instances of houses which, with interest and sinking fund, would cost the public about £4,000 each, and he compared that with the subsidy of £100 which was the final and definite figure of cost to the public for such houses.

In supporting the resolution, Mr. W. Boar (Manchester) said there were many builders who had been forced out of business who had capital and experience to build houses when it was made into an economic proposition. The builders had been accustomed to erect large numbers of houses for letting purposes, and if they could go to the Government with a suggestion which would enable them to see a business proposition, it would open the door to a large amount of building of the cottage type. Mr. E. R. Jones (Liverpool) also supporting, suggested that if the cottages were relieved of local rates, and money was advanced by the Government at a low rate of interest, cottages could be built to let on a business basis.

Mr. G. F. Darbyshire (Manchester), Vice-President, proposed, and the resolution was adopted, "That the Federation draws attention to the failure of the local authorities on their own housing schemes to provide accommodation for the working classes who require small houses at low rentals, and protests against the erection of larger type semi-detached houses as part of municipal building schemes, as such houses can only be let to tenants who in many instances are able to buy their own house through the assistance of the subsidy to private enterprise. This Federation is of the opinion that if the local authorities' schemes are confined to cottages not exceeding 800 super ft. floor area, built in terraces at 16 or 20 to the acre, the maximum number of houses will be erected and the minimum loss incurred."

In the course of his remarks, Mr. Darbyshire said he had seen reports in the Press that the Government Housing Programme would probably confine the subsidy to houses which were to let to tenants, and he said if that were done there would be no assistance for the capable working man and no opportunity for the house builder. The resolution was seconded by Mr. George Sadler (Nottingham).

Mr. G. A. Perks (Long Eaton) proposed, and G. H. Brown (Manchester) seconded, the owing resolution, which was carried:—
he Federation wishes to draw the Govern-nt's attention to the present serious shortage building materials, especially bricks, tiles slates, and recommends the Government make certain that an adequate supply of erials will be available before encouraging l authorities to embark on extensive building emes as the alternative will be a period of easing prices which must prejudice all rts to relieve the house famine."
Mr. Perks drew attention to the effect of shortage in increased prices and quoted eral substantial increases which he said taken place recently solely owing to the rtage of supply.
A resolution was also passed registering the phatic opinion of the Federation that on any tutory committee formed in connection with sing the Federation should be adequately resented.
t was decided that the half-yearly meeting September should be held in Leamington.

KILLED LABOUR FOR HOUSING

Writing recently in *The Times* on this subject . Cecil B. Levita (Chairman of the Housing mmittee of the L.C.C.), said:—
"The report prepared by the National House ilding Committee on April 10 and presented Parliament, which is understood to contain outline on which the Government's housing posals are being based, presents many tures of importance to local authorities. however, these are still under the considera-n of the local authorities, I do not propose e to deal with questions which must be settled ween local authorities and the central vernment; but as housing up till now has n limited by the shortage of labour, evidently proposals of the Committee in this con-tion to supply the necessary labour for the eme are of paramount importance.
"It is understood that the main reason for proposed fifteen years' programme is that:—
. the organised workers view with appre-sion the prospect of increasing the skilled *sonnel* of the industry and feel that they st have the completest assurances possible t such an increase will be satisfactorily orbed, and that future demands for their vices will be maintained at an adequate el. . . .'
A scheme for securing further skilled labour apprenticeship is adumbrated in the report. With the best good will in the world it is icult to see how it is possible by means of scheme to secure sufficient augmentation of led labour to carry through the programme cified in the report. The apprenticeship eme applies to six of the building trades—nely, bricklayers, carpenters, slaters, plas-rs, masons, and plumbers—of which trades 000 operatives would, on the basis adopted the report, be required for the production of 000 houses in the first year. Assuming that e is an annual wastage of one-thirtieth, due uch causes as death, retirement through old ill-health, change of employment, emigra-. &c., and that the number of apprentices be maintained at the full one-third of the ber of journeymen as suggested in the eme, and that these will become skilled crafts-n at the end of their course of training, the l number of skilled craftsmen at the begin-g of the first, fifth, ninth, and thirteenth rs, and the relative output, as compared with programme, would be as follows:—

Year.	Craftsmen.	Output. Houses.	Programme. Houses.
st. 1925	54,000	90,000	90,000
th, 1929	63,000	105,000	135,000
h, 1933	73,000	122,000	210,000
8th, 1937 ..	85,000	143,000	225,000

The output year by year would depend ly upon the varying efficiency of the appren-tices in the different trades, but the report makes no attempt to deal with this question. On what I consider would be a reasonable basis of efficiency, the equivalent output of houses in the first ten years would be 1,114,000, as compared with the report programme of 1,500,000, or a deficiency of 386,000. It would seem as though the upper limit of production suggested in the report—namely, 225,000 houses in one year—could not be achieved under the proposed apprenticeship scheme until about the twenty-fifth year.
"Apart, however, from the arithmetical results of the scheme, it is interesting to note that the satisfactory conduct of the whole matter will depend upon harmonious working, and that certain new factors are introduced which are in the nature of an experiment in the region of labour conditions. For example, the local transfer of apprentices from one employer to another is a matter suggested for a local consultative committee of employers and employed. Theoretically this seems feasible, but in practice presents formidable difficulties, possibly surmountable with good will on all sides. Further, there is the greatly increased ratio of apprentices to craftsmen—one in three taking the place of previous maxima of one in five or one in seven. There are consequent problems in regard to the training of this additional number of apprentices, and it may be assumed that not all the workmen are competent and willing to train apprentices. The need, therefore, for some definite form of technical training arises, of which no mention is made in the report.
"This is the more important inasmuch as housing work is limited in its range and cannot provide a completely satisfactory field of training. It is clearly of importance in the national interest that any scheme of training should aim at providing satisfactory skilled workers for the future. Problems confronting such workers may arise, from time to time, through changes in contracts, changes in the methods and uses of building materials, or for other reasons.
"There would thus appear to be two outstanding points regarding which definition is required (1) whether the proposals as outlined in the report can produce the number of houses, and (2) whether satisfactory groups of skilled workers will be produced in sufficient numbers to enable this work to be done and to fit ultimately into the national economy.
"Whatever merits an extension of the apprenticeship system on the lines proposed by the National House Building Committee may possess, the urgent necessity for houses is so imperative that a National Housing Policy ought not to be made dependent upon a single method of securing the necessary labour nor should it be unavoidably delayed while young apprentices are being trained.
"If the nation is asked to subsidise housing in the manner outlined, it should not be too much to ask the Labour organization to assist by making further special arrangements applicable only to work on subsidised houses, such as removal of restrictions to the employment of skilful labourers, a longer working week, and the admission of payment by results accompanied by a guarantee of a minimum wage per hour. This last point in itself would go far to diminish the shortage of labour.
"A national housing policy ought not to be made dependent on a single method, doubtful in its success, of securing the necessary labour, nor should it be delayed until sufficient young apprentices have been trained."

A Wren Church.

St. Mary Somerset Tower, the remnants of an old Wren church in Upper Thames-street, has been converted into a rest-room. It was officially opened recently by the Lady Mayoress, who was supported by Sir William Pryke, Alderman of the Ward of Queenhithe. Father Sankey, Rector of St. Andrews-by-the-Wardrobe, said St. Mary Somerset Tower would be open every weekday, except Saturday, from twelve until three o'clock.

BOOK REVIEW

The Workmen's Compensation Acts, 1906 to 1923, with Notes, Orders and Regulations. By W. Addington Willis, Barrister-at-Law. 22nd edition. (Butterworth & Co., London. 1924. 15s. net.)

"Willis's Workmen's Compensation Acts" is one of those volumes of which usually it is only necessary for the reviewer to record the issue of another edition, and to note that it has as usual been brought thoroughly up to date, but this edition of what may be termed a standard work calls for special notice, as the Workmen's Compensation Act of last year has so altered the law that all previous editions will be out of date and the present edition will be an essential addition to every library.

In our summary of this Act of 1923 in our issue of December 28 last we regretted that the precedent set in the Bill introduced last year by the Labour Party had not been followed, and that the whole subject had not been dealt with in one consolidating measure, as this would have simplified the subject, and we imagine the author would agree with us, for it must have proved a difficult task for him to incorporate the new matter with the old so as to render the subject as clear as he has, but even with all his ability it is impossible not to see how much the matter would have been simplified had the legislature at once consolidated the statutes.

In his preface he admits it has been a difficult task, but on the whole he has thought the practitioner would prefer to have the new provisions in close proximity to the sections they affect, rather than to have an annotation of the two statutes separately, and we think he has decided rightly, as, with the marginal line drawn where any new matter is dealt with, and any repealed matter being printed in italics, he has certainly done his best to present a very complicated subject clearly. We would especially call attention to the references given n the preface to the pages where the new matter is to be found, as this also is an assistance.

The "rustic justice" originally aimed at in Workmen's Compensation legislation was never attained in the first instance, but it is now left far behind, as, to calculate compensation, mathematical skill of a high order has to be possessed, and in this connection we may draw attention to the table which the author has compiled at page 274, which shows the practical working of the provisions as to "earnings" and "compensation," and is also of assistance in calculating the compensation payable in cases of partial incapacity under section 4, subsection (3) (b), as will be seen at page 277. This subsection appears so complicated in the Act that the reader is staggered by it, but when he studies the formula supplied by the author and finds the result can be attained by multiplying the difference between the average pre-accident earnings by the maximum weekly payment plus the additions, as shown by the table on page 274, and dividing the sum by the average pre-accident earnings, the reader of this volume feels like the man who escaped from prison by the simple expedient of opening an unfastened door.

This volume contains all the well-known features of the many former editions, and all the new information which is essential for those who have to deal in any way with Workmen's Compensation, and it is only necessary for us to draw attention to the fact that it is now available, and forms a valuable guide to the new and complicated legislation.

Muhammadan Architecture in Egypt and Palestine. By Martin S. Briggs. (Oxford: The Clarendon Press).

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

On April 29 the Builders' Clerks' Benevolent Institution held its 44th annual dinner at the Holborn Restaurant. Among those present were Messrs. Roland B. Chessum, E. J. Brown, E. S. Rider, F. W. Loatby, F. G. Minter, A. B. H. Colls, A. W. Hall, F.R.I.B.A., H. W. Wills, F.R.I.B.A., W. Doddington, Godfrey Sykes, hon. sec., G. Brittain, J.P., J. B. London, E. Coles, M.S.A., F. A. Humphrey, A.R.I.B.A., H. T. Holloway, P.L.M.B.A., F. Shingleton, M.V.O., G. S. Roberts, F. M. May, J. M. Theobald, F. Higgs, F. Thorne, J.P., J. S. Crosbie, F.R.I.B.A., P. C. Culver, R. D. Bartlett.

Mr. A. B. Falkner, proposing "The Builders' Clerks' Benevolent Institution," said it had carried on for 50 years. Up to the end of last year £220,665 had been paid in permanent pensions. It was not a benefit institution, but a benevolent institution, and he made an urgent appeal that it should be supported.

Mr. P. C. Culver, proposing the "Architects and Surveyors," said he hoped they would continue, as in the past, to show their interest in the Builders' Clerks' Benevolent Institution.

Mr. H. W. Wills, responding, said architects had a perfect form of insurance, that was by the employment of good builders. If they employed first-rate builders they would be certain to finish their jobs with credit, not only to themselves, but also their clients. One of their difficulties was that a man made up his mind in a spirit of romance and perhaps spent more money than was prudent.

Mr. E. J. Brown, proposing the "Builders and Builders' Merchants," said the builder and builders' merchant had passed through a serious time, but in the course of a few weeks they would know what was going to be done to rehabilitate the industry to the satisfaction of the country at large. At the present time the burden was something more than the individual builder should be called upon to bear. Mr. Brown then mentioned the high regard with which Mr. H. T. Holloway was held in the building industry, and coupled his name with the toast.

Mr. H. T. Holloway, responding, said he was not without hope that the threatened strike would be prevented, but they were convinced they had reached the limit of their generosity; although they hoped the leaders would see reason and not plunge the country into disaster. It was not altogether a question of wages, but concerned the sanctity of agreements. They did not wish to grind down the workers, and were prepared to pay them all the industry would stand. But the cost of building was high, and must be brought down. It was up to the workers to stimulate output and production, and thereby bring down the cost of living. It was no advantage having a higher rate of wage if an enhanced price had to be paid for goods. Stability was the best way of solving the difficulties.

Mr. F. Thorne, proposing the President, made an appeal that the Institution should be kept up to its usual standard and continue progressing.

Mr. A. B. Falkner then briefly responded.

Change of Address.

The London offices of the British Reinforced Concrete Engineering Co., Ltd., have removed to King's Buildings, Smith-square, Westminster, S.W.1. The Constructional Department telephone numbers have been altered from Victoria 7866 and 3218 to Victoria 6530 (two lines). The Roads Department telephone number remains the same—Victoria 7833.

RATES OF WAGES IN THE BUILDING TRADE

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur :—

	Masons.	Bricklayers.	C'p'ters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.

New Tube to Morden.

The Underground Company recently placed two important contracts with Messrs. Charles Brand & Son and the Foundation Company, Ltd., for the driving of tunnels on the extension of the City and South London Railway from Clapham Common to Morden. Work is to begin forthwith, and the new line will be completed about August, 1925.

Messrs. Charles Brand will undertake the section between Clapham Common and the north end of Tooting Broadway Station, while the Foundation Company will be responsible for the section of the line to Dorset-road, Morden. The contracts amount together to about £600,000; to this figure must be added the cost of the stations, rolling-stock, escalators, and passimeters, which, it is estimated, will probably bring the total cost of constructing and equipping the Morden extension to £3,500,000.

Tidying Up.

The Scenery Preservation Committee, which was formed, with the Marquess Curzon as Chairman, at a Mansion House Conference on April 25, recently held a meeting at Keston, Kent. Major P. A. Slessor, Hon. Secretary of the Committee, outlined certain measures that are to be tried at Keston to stop the spoliation of the Common and other places of beauty.

It is the intention that Boy Scouts shouldpatrol the Common and hand out notices asking picnic parties not to leave litter. Local residents are asked to form a corps of Common rangers, each taking at certain times care of a strip of the Common. Also cigarette manufacturers are to be asked to issue a series of cigarette cards calling attention to the nuisance, and it is proposed to broadcast a talk on the subject from the various stations on the evening previous to Bank Holidays. The cinema, it is hoped, will prove a suitable channel for propaganda.

PROPOSED NEW BUILDINGS & OTHER WORKS *

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

ACCRINGTON.—Queen's-road railway bridge has been the subject of negotiations between the borough and county surveyors.

AINSWORTH.—The Crown Brewery Co. propose to remodel the White Horse Hotel, and a new Council office is to be erected.

BALSHAGRAY.—The Balshagray Building Co. are to erect 260 houses overlooking Victoria Park. The plans have been approved of by the Glasgow Corporation.

BASINGSTOKE.—The Committee has passed plans for a steel-framed garage, with 15 lock-up shops in London-street, for Messrs. W. W. Webber, Ltd.

BATH.—Plans approved: Houses, All Saints'-road and Cleveland-walk; pavilion, Junction-road; bungalow, Marlborough-lane; houses, Wellsway; rebuilding, 7 and 8, Abbeygate-street; house, Van Dieman's-lane.

BILSTON.—The U.D.C. has authorised the storm tanks in connection with Lunt sewage extension to be lined with reinforced concrete. Plans passed: House, Prouds-lane, for Mr. W. A. Shore; house, Greenway-road, for Mr. C. G. Yeomans.

BIRKENHEAD.—St. Mark's Church have received permission to erect a reredos with side panels of oak to extend westwards the sacrarium of the side chapel, and to refloor the sacrarium with a parquetry block and white mosaic floor in oak and walnut. ——The T.C. has allocated £3,000 for renewal of water mains. Plans passed: Pair semi-detached houses, Bebington-road; converting houses, Nos. 81 and 83, Grove-road, into houses and shops; nine houses, Tollemache-road; seven houses and shops, Borough-road. The M.H. has given consent to the borrowing of £120,000 for the erection of 200 houses, and the Estates Committee proposes contracting with Mr. Sharples for building the houses.

BIRTLEY.—St. Joseph's R.C. School is to be enlarged.

BLACKBURN.—The T.C. decided to raise by loan £21,377 for erection of houses in Intack housing site, and to apply for power to borrow £1,000 for alteration and adaptation of Horncliffe, Dukes Brow, for use as a department of the Grammar School; and £19,162 for erection of 50 houses on the Brownhill housing site. The congregation of St. Peter's Church, Byrom-street, have decided to erect a side chapel in oak as a war memorial. The chapel, enclosed by screens, will contain an altar and reredos, the latter with four panels. The estimated cost is about £555.

BLACKPOOL.—It is proposed to erect a new church, vicarage and verger's house for the parish of St. Stephen's on the Cliffs. The Corporation have agreed to support the Chamber of Trade in its representations to secure an improvement in the present railway goods sidings. Plans and estimates have been prepared for the proposed widening of the main road from the Borough boundary to the Clifton Arms Hotel, at Marton, estimated to cost £44,638.

BLAYDON.—The U.D.C. has arranged to purchase land for a housing scheme.

BOLTON.—The Libraries Committee is considering the provision of a new branch library at Tonge Moor. The Baths Committee has rejected a site suggested for a public bath in the Chorley Old-road district. The Borough Engineer has been asked to prepare plans for the widening and improvement of Lewer Bridge. A new depot for the Lighting Department is to be erected. The Housing Committee has purchased the Moorfield Estate of 19 acres for a housing scheme, and 5½ acres are to be offered to the E.C. as a site for a school. Plans passed: Two houses, Greenmount-lane, for Mr. A. S. Woods; three houses, Thompson-road, for the Bolton Modern Building Co.; 12 houses Alexander-road, for Leigh Bros., Ltd.; bungalow, St. Helens-road, for Mrs. Hibbert; 12 houses, Normanby-street, for Mr. J. S. Hughes; four houses, Bromwich-street, for Mr. J. E. Paiton; two houses, Bradford-road, for Mr. T. Blakely; nine houses, Wilmot-street, for Mr. E. Johnson; two houses, Bartley Memorial Cottages, Mariners' Home, for the Mercantile Marine Service Association; eight houses, Willoughby-road and Station-road, for Mr. G. Peers; house, corner of Marlowe-road and Monmouth-road, for Mr. W. J. Burton.

WARRINGTON.—Plans passed: Two houses, in Manchester-road, for Messrs. Bramhall Bros.; depot and service station, Knutsford-road, for the Anglo-American Oil Co., Ltd.; sub-station, Winwick-road for the Warrington Electricity Committee; pair semi-detached houses, Lovely-lane, for Messrs. Lee & Healey; pavilion in playing-field, for the Warrington Grammar School; addition to depot, Crossfield-street, for Shell Mex, Ltd.; an estate plan, submitted by Messrs. Firth & Co., Ltd., showing an amended lay-out, is under consideration. The B.S. has been asked to prepare an estate plan or lay-out of land adjoining the Reynolds-street site.

WHITWORTH.—The Lancs E.C. at Preston have decided to erect a new school in this district.

WIGTON.—The R.D.C. has passed plans of a bungalow at Mealsgate, for Mr. W. Penn.

FIRES.

LEEDS.—Over half of Osmandthorpe Hall, an old building of the Tudor period, near Leeds, has been completely destroyed by fire.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Coatbridge.—LAUNDRY.—Plans have been passed for a washhouse and laundry at Woodside House, for Mrs. M. S. Spencer, at an estimated cost of £550.

Rosyth.—INSTITUTE.—The Dunfermline Dean of Guild Court has granted permission to the Carnegie Dunfermline trustees to erect an institute at Rosyth, conditionally.

Turriff.—COTTAGES.—The Corporation Plans and Buildings Committee has passed plans of double cottages proposed to be erected by Mr. Joseph Rae.

Milngavie.—VARIOUS.—The Dean of Guild Court has passed the following plans: Mr. Hugh R. Buchanan, Underfall, cottage for the gardener; Mr. Duncan M'Pherson, Onslow-drive, Dennistoun, four-apartment bungalow, Strathblane-road; Mr. A. R. W. Allen, studio adjoining his house, Balfleurs-road.——The T.C., two houses, Craigdhu-road.

Motherwell. — COTTAGES. — The Dean of Guild Court has passed plans for ten cottages and one villa.

Hawick.—HOUSES.—Plans have been passed for four houses at Twirless-road, for the Hawick Working Men's Building and Investment Co., Ltd. Plans have been passed for twelve Council houses at Mansfield, Hawick.

Clarkston.—SCHOOL.—The Lanarkshire E.C. has adopted plans for a new school to be erected, at an estimated cost of £14,000. The plans will be forwarded to the Scottish Education Department for approval.

COMPETITIONS, CONTRACTS, &c.

MAY 10. — **Dumbarton.** — ALTERATION. — Alteration and restoration of Glencairn House, High-street, for Gas Committee. Tenders must be for complete job. Particulars from Burgh Engineer, Municipal Buildings.

MAY 13. — **Kirkcaldy.** — ADDITIONS. — Additions to Saline Public School, for the Fyfe Education Authority. Schedules from Mr. G. Sandilands, Master of Works, Education Offices, Kirkcaldy. Deposit, £1 1s.

NEW CHURCH, GIGHA

The new parish church of the islands of Gigha and Cara was opened and dedicated by the Rev. Mr. Davidson, of Campbeltown, recently. A war memorial window and tablet were also unveiled. These windows are from the Stephen Adam Studios. Two tablets were also unveiled, one to a former minister, the other to a donor to the church. The new church is an example of the work of Messrs. Jeffrey, Waddell & Young, architects. Kenmore Parish Church, Perthshire, has also been renovated by this firm.

Rebuilding Berwick Station.

The directors of the London & North-Eastern Railway, it is stated, have decided upon the entire reconstruction of Berwick passenger station, built 77 years ago, and have placed a contract for the work with Messrs. Hugh Symington & Sons, public works contractors, 190, West George-street, Glasgow, the total expenditure being estimated at between £45,000 and £50,000.

Society of Antiquaries.

At the anniversary meeting of the Society recently, the customary elections of officers and Council for the ensuing year were held and resulted as follows: President, The Rt. Hon. the Earl of Crawford and Balcarres, K.T.; Treasurer, William Minet, M.A.; Director, C. R. Peers, M.A.; Secretary, Ralph Griffin. Members of Council: J. N. Bankes, Lt.-Col. H. F. Bidder, D.S.O., J. P. Bushe-Fox, F. William Cock, M.D., J. E. Couchman, Major Victor Farquharson, M. S. Giuseppi, Robert Holland-Martin, C.B., John Humphreys, Rev. Professor Claude Jenkins, M.A., P. M. Johnston, W. A. Littledale, M.A., Lt.-Col. H. W. Morrieson, Professor J. L. Myres, O.B.E., M.A., D.Sc., R. Garraway Rice, J.P., W. Barclay Squire, M.A., M. F. Tweedie.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Mason...	Brick layers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick- layers' Labourers.	Plas- terers' Labourers.

THE DANGERS OF FASHION IN ARCHITECTURE

T is a conceit peculiar probably to human kind to wish to be *de rigueur*. Our women, it has been said, would be more miserable with good dinners and last year's frocks than with no dinner at all and the latest creation of the modiste. Nor can the sterner half of humanity 'd to scoff too openly at this gentle but universal failing 'oman. Most of us in the middle way of life remember time when as students on an income provided by "the ernor" we endeavoured to blossom like flowers—our ing coats and waistcoats were immaculate, our Gibus were the newest shape, and our socks the latest and last g in style.

Some of us, from misfortune or secret egotism, have photos urselves in our Beau Brummel days, and view with horror dreadful collars, the awful broadcloth coats, the weird terribly shaped toppers and other things which we con- red perfect, but which now are revealed to us as merely 'ulous. And if we observe those of our young friends who t the fashions of the day, we may be inclined to k that while they are strictly correct in every detail at time, they will look in years to come on those high ted dress coats, those long-pointed waistcoats and the r delights with the same horror with which we regard one time figures of pride and joy.

This sense of fashion or vogue runs in a peculiar way ugh all human corporate life. Our literature, our art, food and drink, our patent medicines, even our vices ere we have any, of course) are all the time influenced it and changes come and go as with the aconite and a donna of our childish memory when homeopathy the ruling passion of prudent mothers. This con- tly raging fever for stylishness as set by the fashionable , and its absorption into the unrealised habits of the people, ot very perceptible or very dangerous in the main where things affected are things which pass, but, unfortunately ffects what is to remain as well as what is to go. Our nes wear out, our books are repulped and made useful, our ties and follies change, but what we build is as permanent as human thing can be permanent, and since it is affected as ugly as any other human activity by the god of fashion dangers are proportionately greater. Twenty years ago or two extremely able and correctly tasteful architects uced some delightful quaintnesses of style in domestic itecture, and while these masters of their craft used their with restraint and effect they were unfortunately so ssful in delighting the public's optical palate that these ntnesses of form became a vogue. This vogue spread or less into every small office in the country until we smothered with the most appalling aberrations of con- tive fancy that seemed possible to produce. Speculative lers then endeavoured to copy it, and at length it died vanished, passing like an evil dream except for those nal legitimate quaintnesses and tasteful sweetnesses that the founders themselves had made. We called it *l'art nouveau*; it might have been named the *le fevre diabolique*. This particular example is cited because it was the most pernicious of those in memory, but it must not be thought that we are free to-day from similar dangers. We can see the reflection of it if we look back, as sufficiently profuse examples exist. Unfortunately, fashions always run to extremes. They are adapted by extremely fashionable people who do not possess the restraining sense of taste which characterises legitimate "smartness," and so we see in the Gothic work of the fashionable architect of seventy years ago, the monotony of the suburban architecture of thirty years ago, and some of the buildings erected to-day, the effects of this malevolent and insidious disease.

The peculiarly receptive sense of our eager generation, as ready as a sponge to absorb ideas, is painfully susceptible to this malignant illness, and it behoves us to inquire in what direction infection lies. It is fairly easy to point out the danger and, probably, just as difficult to avoid it. At the moment design is healthy. There is more cultivated aspiration, more well-informed thought at our command than before. But the very eagerness in aspiration unless the scholarship at our command is fully called upon will lead to greater mistakes in taste unless a careful restraint is exercised. At the moment we are in a highly critical state so far as Renaissance is concerned. There is no doubt that with the peculiar importance of light in the greater part of England the Renaissance style is the most suitable one in which to develop, and, therefore, the general trend of design is, probably, sound, but in detail we are rapidly approaching a point at which, unless we are on our guard, we shall find ourselves producing work which is structurally good but is æsthetically revolting. Several examples come to mind, though since they are all by living architects, some of whom are well known, it would be invidious to take exception to any one; but there is a bad mixture of good Renaissance proportion and horrible detail to be seen in nearly every large town, in which we see a grotesque *melange* of Renaissance and *neo grec* with discs like archery targets, medallions fantastically huge and coarse, guttæ like exaggerated bakers' weights limned without a thought of their significance or the basis of their form. These details are getting common and they pass now because they are the vogue and especially as on the drawing they look fashionable, but in ten years' time they will, we can hardly doubt, create a dislike to discriminating taste and educated thought.

To suggest that classic design should be merely a slavish reproduction of archaic detail would be as foolishly restrictive as the other is obnoxiously distasteful. The development of all good design comes from the power of enlarging or developing or even refining the excellences of all that tradition and time have shown to be excellent, but the initiative which brings this about must be highly discriminating and truly wise, else we shall have a result which can only be crude and unsatisfactory.

NOTES.

The R.I.B.A. and Registration.

THE following circular letter has, we are informed, been sent to all members of the R.I.B.A. by the President, Mr. J. A. Gotch. Our own views on the subject were expressed in our leading article last week.

"DEAR SIR,—You have probably seen a circular issued by the 'Defence League' in which the Council are asked to put the following question to the Right Hon. Edward Shortt, K.C. :—

"'If the amalgamation takes place, do you see any possible chance of Architects obtaining Registration?'

"At my instructions this question has been put to Mr. Shortt, and I think his answer should be sufficient to convince any doubtful minds of the necessity for the amalgamation with the Society of Architects which the Council are proposing.

"Mr. Shortt's answer is as follows :—

"'I am asked whether, in my opinion, if the amalgamation takes place there is any possible chance of Architects obtaining Registration. I am of opinion that there is more than a possible chance; there is a reasonable probability, with a reasonably good case on public as well as professional grounds. My opinion, of course, assumes that the proposed amalgamation will be carried out, without which the difficulties would be very much greater.'"

The Swedish Exhibition of Architecture.

IT was with feelings of pleasurable interest that we inspected the Exhibition of Swedish Architecture at the R.I.B.A. on Monday, illustrated by a number of good drawings, photographs, and exceptionally good models which strike a happy mean as to size and detail. We doubt if there has ever been seen at the Institute so good an exhibition of its kind. After the crowded architectural room at the R.A. we can fully appreciate the generous lines of such an exhibition as this, which at once seems to justify Mr. Arthur Keen's happy extension to the Institute's capacity. Our northern confrêres have shown here no mean ability in handling a variety of subjects, from churches and public buildings to hospitals and factories. Some of the buildings for purely industrial uses promise to be quite fascinatingly picturesque. Without going into detailed notice of the work here, it is sufficient to note that we find dignity of handling, refinement of detail, and the value of reserve conspicuously brought into play, and the work as a whole suggests far more of the pleasure of the architect in his work than does an average British exhibition of the present time.

Waterloo Bridge.

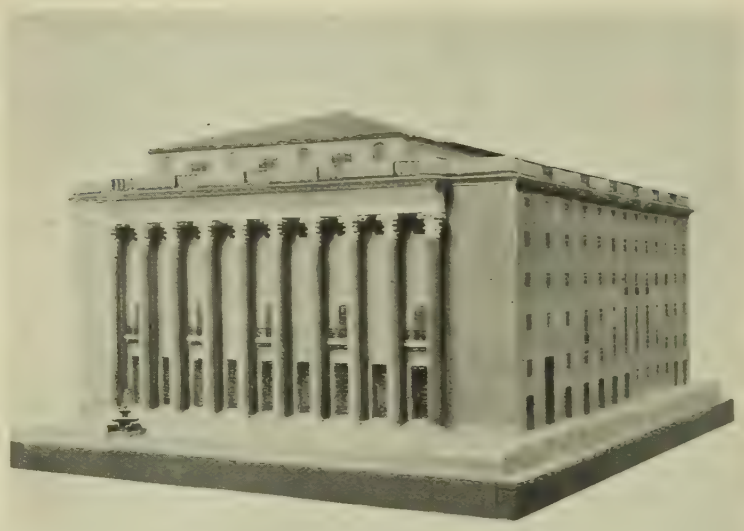
IF one had been asked point out a structure w appeared to have a loo long endurance one m naturally have singled out Wate Bridge. We were told long since b construction specialist that a vousso one of the arches was on the verg sliding through, so that the subsid of the pier has been going on slowly surely for some time. The scour of river must have great force, but the no reason to doubt that a pier can be in now of sufficient strength to withst all possible strain and in the wide bridge the new piers will have l additions to their bulk. It is ama that the foundations were constructe they were, but we shall all watch much anxiety for the signs of sugge improvements on Waterloo Bridge that it has to come down, and not fo that we have been promised a re structed bridge and not a new design.

St. Paul's Bridge.

MR. PAUL WATERHOUSE put clearly and concisel a letter to *The Times* strong points in the a tion against the St. Paul's Bridge. maintains that the City must not be as a passage-way, and that the Surrey of the river has a vital need of a pr planning scheme: here are two th

Swedish Architecture Exhibition.

Stockholm Town Hall. MR. R. OSTBERG, Architect.



come into direct conflict with the Paul's Bridge. He fears that South- and the whole urban area from beth to London Bridge is being left to its chance and repeats what we have ften said, that London is far too able for piecemeal jobbings when it for general control. The closing of erloo Bridge emphasises surely more gly than ever the need for a Charing s road bridge.

rchi- ctural ication.

We have read with great interest the paper which Prof. Beresford Pite read to the Edinburgh Archi- ral Association on the subject of tectural education. It is a paper h every student of architecture d do well to read and digest. Ob- sly our methods of to-day are not ether an improvement on Victorian s, and we are in danger of super- ity and of working in water-tight partments. Such comments as the wing cannot be disregarded when re studying the prospects of archi- ural education. "The atmosphere forcing pit too often pervades an oition of school designs. Intensive vation, whether of vegetables, live- k, or of architectural students, pro- s phenomenal specimens of doubtful mercial value, and needs the constant teration of the builder's and work- 's intellectual and practical outlook. study of practical design in schools ents greater difficulty than that of retical or so-called applied construc- The tendencies of the office are sted daily to the idiosyncrasy of ent, and by the terror of the estimate. e persistent thorns in the flesh of the ous practitioner do not afflict the ol. The instructor is happy in free- from such anxieties, and he stimu- the uninstructed to flap their wings paradise of art where such malicious ts do not trouble. Unless the teacher elf has been hard bitten by the rsities of practice, and is caustic as as sympathetic in disposition, his is doomed to much disillusionment e later processes of life on earth."

fter ner.

The report of the annual dinner of the R.I.B.A. as conveyed in *The Times* may give a misleading impression at section of the public which is suf- tly interested in architecture to it at all. The President (Mr. J. otch) struck the right note in his h—architecture, he said, was neces- and visible; it was essential the public should have know- of its principles. Lord Midle- who followed him later, ap- tly took refuge in that lifebuoy e layman, who feels that he may be of his depth, in abusing the Albert orial, with which he coupled the ng Cross Bridge and the Temple Bar ffin." We are no champions of these

Swedish Architecture Exhibition.

Accepted Design for Concert Hall.

Mr. Ivar Tengbom (President of the Society of Swedish Architects) Architect.

erections. At the same time we would remind Lord Midleton that the architectural significance of a great city does not depend on its isolated monuments, but on the general character of its houses, shops and public buildings. No one now is likely to plead for more Albert Memorials, and the "Griffin" has been finally immortalised—and left—in "Alice in Wonderland." What, however, the public does need is enlightened instruction in the mass of building surrounding it and to learn that architecture is not concerned with the monumental alone. Lord Curzon did the cause of art real service when, at the Architecture Club, he inveighed so pungently at the small house and villa. We wish the innovation he then introduced had been taken further.

Sale of the Swaythling Collection of Silversmith's Work.

It is not often possible to closely study fine examples of silver work, and the opportunity afforded last week by the view and sale of the Swaythling collection at Christie's was an exceptional one. The greater part of the collection has been exhibited for some years at South Kensington, and we should imagine that its disposal will be regretted by all who care for such things. Some 130 remarkable specimens dating from 1494 to 1780 were offered for sale, and realised the extraordinary total of about £93,000. The earliest piece, an Irish chalice and paten, dated 1494, was acquired for the Irish National Collection. Far higher prices, however, were given for the following rare examples:—A Tudor cup, 3¾ in. high, £7,500; the Rodney cup, fifteenth century, £7,600; a tankard and cover, 1556, £6,000; an Elizabethan ewer and cover, 1565, £6,000; a French silver-gilt rosewater ewer and dish, 1580, £2,800. An exceedingly rare set of three steeple-cups, dated 1611, realised £4,700, and a standing cup, formed of an ostrich egg with cover, dated 1623, £5,700. Paul Lamaire was represented by twenty-eight pieces, dating from 1712 to 1750, and covering practically the whole period of this fine craftsman's work, which were sold for very high prices, averaging about £8 per ounce.

Individual Effort.

When so much personal effort is being made to ameliorate the lot of our fellow creatures it might appear unnecessary and invidious to single out examples for special reference, but we think our readers will agree that there occur sometimes special instances in which one feels impelled to make a passing comment. One such, we feel, is the sustained effort by Mr. C. F. A. Voysey to aid the work of the Artists' General Benevolent Fund—a total of £350 above last year. Out of the fine total of £4,864, announced on the 7th inst., Mr. Voysey headed the list with £700, and, in reply to the congratulations of a friend, said he had written 1,658 letters in pursuance of his object. We are sure that the Hon. Secretary, Mr. Guy Dawber, and others who have worked hard in this matter, will be the first to agree that some words of recognition are not misplaced.

A Swedish Compliment.

The compliment paid to the architectural profession in this country by the presentation of a diploma from the Swedish architects on Monday to Sir Aston Webb will be generally appreciated, especially at a moment when so much sympathy is being felt for him in his recent accident. Besides being a likeable people, the Swedes have now shown us by the exhibition at the galleries of the Royal Institute of British Architects, that the art of architecture is likely to make some real progress in their hands.

GENERAL NEWS

Professional Announcements.

Mr. Wilfrid Travers, O.B.E., F.R.I.B.A., has removed his offices from 1, Featherstone-buildings, W.C.1., to 36, Furnival-street, Holborn, E.C.4.

Mr. Henry J. Chetwood has transferred his office to 88, Gower-street, London, W.C.1.

Mr. Bankart has removed to 35, Bloomsbury-square, London, W.C. 1.

R.I.B.A. Meeting.

The General Meeting of the R.I.B.A. which was to have taken place on June 23 has been cancelled.

Architect's Estate.

Mr. Thomas Henry W. Walker, of Kelvin-grove, Liverpool, retired architect, left (net personalty, £6,702), £10,823.

Board of Architectural Education.

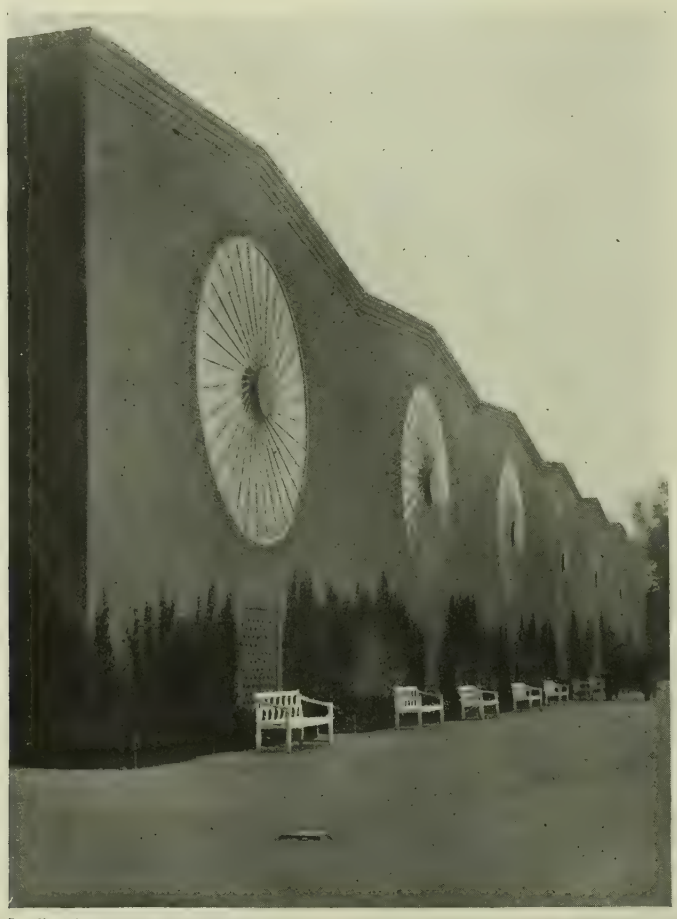
The Council of the R.I.B.A. has decided that candidates for the special examination shall be allowed to take the examination in two parts if they so desire, as in the case of the final examination.

Architectural Association.

The annual ball, in aid of the Architects' Benevolent Fund, will take place to-night. It will be in the form of an Anglo-Swedish Night in connection with the exhibition of Modern Swedish Architecture now being held at the R.I.B.A. Fancy dress will be worn.

Rivenhall Parish Church.

We understand that the Rector of Rivenhall Parish Church, in the Diocese of Chelmsford, has recently instructed Mr. F. Sidney Webber, Lic.R.I.B.A., to report on the structural condition of the building. The architect's investigations revealed the fact that the remains of the large Roman Palace in the meadow adjacent to the churchyard were probably freely used in the walls of the nave and chancel. The church contains some twelfth-century French glass.



Government Housing.

We understand that the provisional basis of discussion, in the negotiations now taking place, has been that the Government shall contribute a subsidy of £9 a house for a period of 40 years, and that the municipality shall contribute a subsidy of £4 10s. Under the Act of last year the amount of the State subsidy was £6 a year for 20 years.

Mr. Wheatley presided recently over a conference between members of all political parties and representatives of the National Committee of the Building Industry and the Building Materials' Manufacturers and Suppliers' Committee, when the reports issued by the committees were discussed. Mr. William Nicholls replied to questions concerning the building trade report, and Mr. H. J. C. Johnston dealt with matters affecting the supply of building materials. It was sought to discover information as to the ability of the materials industries to provide the required additional supplies without serious increases in price being involved.

The Rent Restriction Bill.

On the ground that "the Tories had consistently refused to treat the Bill on its merits," Standing Committee "A" of the House of Commons, on the motion of Mr. Mardy Jones (who is in charge of it), decided on Wednesday not to proceed further with Mr. Ben Gardner's Rent Restriction Bill, and to report the Bill without amendment to the House of Commons.

Swedish Architecture Exhibition.

The Industrial Hall, Gothenburg Exhibition, 1923.

[Designed by a panel of Swedish Architects].

Obituary.

After a short illness, Brevet-Colonel C Loche Wilson, T.D., died recently at his re dence, "Garn Hill," St. Andrew's, Di Powis. Colonel Wilson, who was fifty years age, was a son of the late Mr. John H. Wils shipowner. In civil life he was an archite being a partner in the firm of Teather & Wils Cardiff. He began his career as a pupil and as tant to the late Colonel Bruce Vaughan, who one time carried on business at Dumfries-pla Cardiff. In 1900 he entered into partners with Mr. Teather. In addition to being a Fell of the Royal Institute of British Architec Colonel Wilson was a past president of the So Wales Institute of Architects; and some ye ago acted as Hon. Secretary of the Institu Two years ago he was appointed inspec of dilapidations of the Representative Body the Church in Wales to the diocese of Llandaf

R.I.B.A. Elections.

We understand from the *Journal* of t R.I.B.A. that the following nominations ha been made by members of the Defence Le in accordance with By-law 32:—

President.—Cross, A. W. S.

Vice-Presidents.—Flockton, C. B.; Per S.; Searles-Wood, H. D.

Members of Council.—Chetwood, H. Clarke, Max; Collard, A. O.; Curtis, W. Fraser, P. M.; Gill, C. L.; Gunton, J.; Hu E. A.; Hunt, W. G.; Joseph, D.; Moo A. W.; Scott, W. G.; Scott-Moncrieff, W. W Solomon, Digby L.; Swan, J. A.; Trave Wilfrid I.; Wills, H. W.

Associate Members of Council.—Ashfo W. H. (Birmingham); Culliford, L. A.; Heav F. H. (Glamorgan); Scott, J. D.; Welford, A Woodward, F.

Members of the Practice Standing Co mittees.—Lovegrove, G. H.; Niven, D. B.

[The Council's list of candidates is giv on *p.* 788.]

COMPETITION NEW

The Harrogate Infirmary.

The committee of Harrogate Infirmary inv designs for the extension of this Infirma Mr. Sydney D. Kitson, F.R.I.B.A., has b appointed assessor. Premiums of 150, 100, 50 guineas will be awarded respectively. Ap cations, together with cheque for two guine should be made to Mr. Geo. Ballantyne, Sec tary, The Infirmary, Harrogate, by May Sending-in day September 30.

Other Competitions.

Other competitions still open include following (the dates given are, first the sendi in date, and second the issue of *The Builde* which full particulars were given):—Indust Designs (June; Dec. 21, 1923). Ross-Sm Memorial (Sept. 30; Feb. 21). Glasgow Pu Hall (July 4; May 2.)

XHIBITION OF SWEDISH ARCHITECTURE

)n Monday Mr. E. Stanley Hall, F.R.I.B.A. esident of the Architectural Association), upied the chair at the opening ceremony of Exhibition of Swedish Architecture arranged the Architectural Association in the galleries the Royal Institute of British Architects at nduit-street, by permission of the R.I.B.A. ongst those present were :—The President of Royal Institute of British Architects (Mr. J. Gotch), Mr. Alister G. Macdonald, Consul Eriksson, Sir Gregory Foster, Sir Edward and ly Boyle, Lord Bury, Sir William and Lady nson-Hicks, Sir Newton and Lady Moore, Charles and Lady Walston, the Hon. Mrs. zroy Stanhope, Sir Lawrence and Lady aver, Dr. and Mrs. Hagberg Wright, Sir ment and Lady Kinloch-Cooke, the Right n. Sir Maurice de Bunsen, Admiral Mark Kerr, Henry and Lady Penson, Mr. Arthur H. vis, Prof. A. E. Richardson, Mr. Raymond ude, Mr. Alfred Praga, Mrs. de Beaufort, Mr. l Mrs. C. Harmsworth, Mr. Herbert Baker, s Cecil, Mr. W. B. Simpson, Mr. and Mrs. gglesworth, Mr. and Mrs. Wester, Mr. and s. Charles Sims, Mr. and Mrs. Hugh Spender, . and Mrs. Siosteen, Miss Weinberg, Miss H. C. ork, Mr. Hamilton Lamplugh, Mrs. Clogg, . and Mrs. C. A. Lowenadler.

In opening the proceedings the Chairman pressed the pleasure of the Architectural sociation in having been successful in arrang- the Exhibition, and thanked Mr. Ahlberg his kind help. All through the ages, he d, the fire and energy of the North had had a ivifying influence on the South, and they d only to look at the Exhibition to feel that edish architects had that fire and forceful thusiasm in their work which British archi- ts were so anxious to foster.

His Excellency the Swedish Minister, who clared the Exhibition open, said it was the ention on that occasion to present to Sir ton Webb a diploma conferring upon him mbership of the Royal Academy of Sweden, t as Sir Aston Webb was unfortunately unable be present owing to his recent accident, he nded the diploma to Mr. Maurice Webb. ntinuing, he said there was much in common ween the two nations, and the more one died what they were doing in the field of art more one realised how akin they were in pressing what was in their minds. Their ional aspirations, their views, and their out- k on life corresponded to a very large extent. architecture the British always understood t paper plans were not sufficient, and that y were not the final end; they were looking practical purposes, and with that sound lism they coupled a sense of tradition. That l made British architecture cultivated and the same time rational. In conclusion, he pressed the gratitude Swedish architects felt the Architectural Association for taking the iative in forming the Exhibition, and to the .B.A. for permitting it to be held in its leries. Mr. Maurice Webb expressed Sir on Webb's thanks for the honour conferred n him, and the proceedings were terminated a vote of thanks, moved by Mr. Gotch, to s Excellency the Swedish Minister for opening Exhibition, and for his sympathetic and erning speech.

Some of the exhibits are illustrated in this ue.

A lecture and discussion at the A.A. on edish architecture on Monday are reported on 786. The Exhibition closes on June 6.

Bethnal Green Museum.

The Bethnal Green branch of the Victoria l Albert Museum is now open on Monday l Thursday evenings until 9 p.m. A guide- urer is now available to conduct parties nd the galleries of the Museum on Monday nings (7–8 p.m.), and Thursday afternoons 4 p.m.).

Swedish Architecture Exhibition.

Bank Building, Stockholm: Detail of Carving.

Mr. Ivar Tengbom, Architect.

CARDIFF CASTLE.*

Cardiff Castle, the residence of the Most Hon. the Marquis of Bute, K.T., is still a dwelling as well as a relic of antiquity, and contains examples of the work of all periods from Roman days to our own time. The illustrated account prepared by Mr. Grant faithfully portrays the many interesting steps by which the Castle has grown from a primitive camp to a magnificently decorated mansion. A great deal of Roman work has been brought to light by the researches undertaken in recent years by successive owners of the Castle. Photographs and plans in the book show how freely the Romans could adapt themselves to local conditions and the use of local material. At Cardiff Castle squared stonework in courses of unequal depth replaces the flint and tile lacing courses familiar to us in Roman remains nearer London. One practice which held good throughout Roman fortifications east and west was observed at Cardiff. The bastions to the curtain wall were built independently of it in order that the unequal settlement of these heavy masses might not occasion fractures at the point of junction. In this instance a considerable lapse of time may have occurred between the building of the wall and the bastions. The Norman Conquest was made the occasion for additional building and a great earthmound or bank was superimposed upon that with which the Romans had lined the interior of their walls. To exhibit the best of the Roman work a passage has been formed in the heart of the earth-bank, and where restoration has been necessary the added work has been distinguished from the ancient by a change of material and by the introduction of a course of red Radyr stone between the new and the old. Within the wall a Norman keep was erected upon a mound 40 ft. high, and several towers and dwelling-places were added from time to time at different points within the boundary wall; the Octagon tower being one of the most important. The external appearance of this tower was materially affected by a spire of timber and lead added about 1875, from the designs of William Burgess, A.R.A. This original genius of the romantic school also created much of the distinctive interior decoration, which combines (in a spirited attempt to revive mediæval art) profound archæological knowledge and great skill in colour composition. The subjects of the decorations are drawn from mediæval legend and sometimes betray a whimsical humour as in the instance of "matrimony" represented by two hounds in leash pulling in opposite directions; and "Life after Marriage" is illustrated by a cat up a tree with a dog at the foot barking at her.

The ever-popular subject of subterranean passages is not forgotten and several extracts are quoted from publications recording the discovery of such passages in the neighbourhood of the Castle. A great deal of interesting historical matter and many plans, views, and photographs are included in the book.

CORRESPONDENCE

Registration and the Proposed Amalgamation.

SIR,—Since my return from India a few weeks ago, I find that the proposals of the present Council of the R.I.B.A. with regard to Registration are very similar to those which I advocated as early as 1911.

As I believe that the possibility of obtaining Registration under the Institute scheme is not so remote as formerly, I feel my position on the Defence League is therefore inconsistent, and have accordingly sent in my resignation to that body and withdrawn my name from the voting list.

GEORGE HUBBARD.

SIR,—In the President's letter to the electorate of May 9 last, the opinion of Mr. Edward Shortt, K.C., is quoted to the effect that, if the proposed amalgamation with the Society of Architects should take place, there would be "a reasonable probability with a reasonably good case on public as well as professional grounds" of obtaining Registration. I submit that this opinion should be taken *cum grano salis*. For Mr. Shortt was asked to assume two hypotheses—

(*a*) That the Society of Architects would oppose Registration if administered by the R.I.B.A.;

(*b*) That the R.I.B.A. would not consent to Registration if administered by an independent body, such as a joint Board.

I contend that neither of these two hypotheses is founded on fact, and that had Mr. Shortt been asked for an opinion as to the possibility of obtaining Registration if the two bodies interested in it suggested it independently of each other, his opinion would have been the same as that quoted by the President. If this assumption be correct, the whole of the arguments advanced by the supporters of Unification fall to the ground. And, further, if we believe that the Society of Architects would approve a scheme of Registration that was not based upon antecedent Unification, shall we not be correct in saying that, practically, the Council of the R.I.B.A. is allowing itself to be coerced by the Society for an ulterior object which is other than that of Registration?

ALFRED W. S. CROSS.

SIR,—A few months ago you were good enough to publish a letter from me about Registration, before the present R.I.B.A. Council's proposals were known. Now that these have been published, and an election upon them is taking place, will you allow me to say that in my opinion they are eminently wise, generous and just, and that they indicate that those who drafted them may be trusted to produce a Registration Bill which would be acceptable both to the architectural profession and to the public whom its members serve?

It is to be hoped, therefore, that the Council's nominees may be elected overwhelmingly.

G. A. T. MIDDLETON.

SIR,—Mr. Travers points out, in your issue of May 2, that the proposals of the Council would hand over the control of the Institute to the "unexamined" men.

Accepting "examined" and "unexamined" to mean one who has, or has not, passed the Associate examination, this is obviously the case: but can one limit examination to one particular examination; and if so, should not one inquire whether all those who have passed that examination at any time are equal in merit?

Before admitting Licentiates, the Institute set up a special examining body and satisfied itself by special examination that men were qualified before they were accepted as Licentiates. Is it then quite fair to describe Licentiates either as "unexamined" or "unqualified"?

Admittedly, the standard of the Associate examination has varied considerably, and only those who passed within certain limits of time can reasonably claim any real distinction which that examination may give. It is manifestly absurd to rule out all men who have not passed a particular examination from any claim to distinction: to do so would deny distinction to some of our greatest architects. Obviously, then, it is not the passing of the Associate examination—or any other examination—which denotes distinction in the profession or gives a claim to control. Other things being equal, age and experience should be recognised, as a better criterion than examination, in considering the control of a professional society.

One thousand and forty-one, or 44 per cent. of the Associate class, have been admitted to the ranks since 1918; does Mr. Travers wish that the control of the Institute should be placed in the hands of the youngest and least experienced section of the profession? Old men are of course learning their lesson that youth is very much at the helm, but even youth itself will hardly claim that it is either entitled or able to govern the profession.

It would appear to me much more dangerous to trust to much-examined youth, just starting out into the competitive world, to settle questions of policy than to trust the judgment of older but less-examined men who have passed the test of many years' practice.

It is quite certain that *esprit de corps* will do more to help us than quibbles about distinction; it is absolutely necessary to impress the public with the fact that all our members are qualified men, and it is essential that members of all classes recognise their common membership of the Institute and act as men interested in a great profession—not in a section of a professional institute.

I do not think Mr. Travers, or anyone else, could elaborate a policy which would have the effect of obtaining the unanimous support or opposition of either "examined" or "unexamined" men.

The greatest power of ultimate control (if every man votes) on any question must rest with the Associates, because they will always be the largest class; this cannot be helped, one can only hope that examinations will give youth wisdom.

J. E. YERBURY.

SIR,—As a student of the R.I.B.A. I should like to say how interesting I found the figures quoted by Mr. Travers in his letter published in your May 2 issue. I do not think I should be far wrong if I said that almost all the students of the Institute regard Fellowship as the topmost pinnacle of their ambitions, and this was certainly so in my case.

Before reading Mr. Travers' letter I was, of course, aware of the fact that Fellows were elected either directly or from the Licentiate Class without examination, but I was under the impression that this distinction was reserved by the Council for exceptionally brilliant men of note, and the fact that there were at the moment nearly 500 Fellows of the Institute who had not been examined amazed me.

In the case of Associateship, this diploma can only be obtained by passing the Institute examinations, so that the inferior diploma is to all intents and purposes the sounder qualification, which is surely a wrong state of affairs.

The result is surely then to lower the status of Fellow and incline to make what is regarded as the highest distinction in the Institute represent nothing at all. Associates realising this will refrain from applying for Fellowships, and in course of time this distinction will be held practically entirely by the unqualified.

By amalgamation with the Society of Architects the Council cannot even reserve the right to elect their unqualified Fellows, but are required to take from the Society, on trust, several hundred of their more or less unqualified Fellows, thus swelling the numbers of unqualified Fellows in the Institute to such an enormous extent that they actually outnumber those w have qualified by over 200.

If this amalgamation should take place, t as far as I can see, the only ray of hope to student desiring to become qualified lies Associateship, which will be fortunately untouched by the inroads of the Socie members, and this he will doubtless make ultimate goal.

M. H. POWEL

[*** In the letter referred to, Mr. Tra states that the new Fellows from the Society Architects will number 200. We believe we correct in stating that at least 40 of these already Fellows of the Institute. He also st that the Members of the Society of Archit who will be joining the Institute will be 1, About 57 of these are already Associates.—E

King's College, Cambridge, Competition.

SIR,—The letter of apology which Messrs. T & Rees have signed and with which Mr. Gor H. G. Holt has asked to be permitted to associ himself is completely satisfactory to us.

We accept the unreserved withdrawal of t charges and now consider the matter to finally closed.

HERBERT J. ROWSE
LIONEL B. BUDDEN

SIR,—Although I had associated myself w Messrs. Tait and Rees in sending the letter wh you published in your last number, I did under the reasonable impression that it was, itself, evidence enough of our desire to m adequate apology.

I did not expect to find the long added amble. What this preamble does is to spr the mistaken idea that our open letter of November was throughout a string of un comments.

Whilst it is now established that in one resp —and one only—the statement then ma namely, that Messrs. Budden and Rowse arri at a particular result "by violating a condit thought to be desirable," was inaccurate conveyed an unfair meaning, the critic obtaining in the rest of our November letter not, and in fact could not be, assailed, and such was never withdrawn.

GORDON H. G. HOL

Westminster Abbey, North Transept.

SIR,—The statement in my letter of April that Professor Lethaby objected to the rest tion of the North Transept because "it was in accordance with the original design," altho it did not express truly his views on restora generally, was quite relevant in respect Westminster. There it happens that "continuity" advocated is broken by construction of modern work based on the records in place of what Professor Leth considered to be the original design (in the —Wren's rendering of it; and in the gable— actual mediæval stonework). Against t these alterations in design he vigorously te ted and accepted the design of the arc as he states, only on the principle of " tinuity" of Wren's work.

Those who have read my paper will, I th agree that there is a considerable amount evidence to support the views of the resto and I hope soon to have the opportunity bringing forward further facts in the endea to show that the noble front as it stands to- is indeed as far as possible an authentic re of the ancient work.

S. HURST SEAGE

Ypres.

The Strand.

SIR,—Mr. Slater is in error when he st that the Charing Cross Hotel is on the of the Duke of Buckingham's House. It Hungerford House which was replaced Hungerford Market. The name still surv in Hungerford Bridge. In Wilkinson's "L dona Illustrata" a view of the old marke given and a plan.

London. ANDREW OLIVE

UNITY AND REGISTRATION

:,—There are certain facts which should
orne in mind by the members of the Royal
tute who wish to make intelligent use
eir votes at the forthcoming Council elec-
. As Mr. Travers writes in your issue
ay 2, it is simply inconceivable that the
l Societies will agree to any arrangement
h will not give their members equal
rs with the Society of Architects. Having
in view, therefore, the result of the
cil's scheme for amalgamation with the
ty is that the present Fellows and Asso-
s, numbering about 3,300, will have to
on the traditions of the Institute in the
of about 5,400 unqualified newcomers,
full voting powers, who are to be intro-
l into the Institute. Will any Associate
s zeal for registration commit the astonish-
folly of supporting these proposals by
g for the Council's house list?
n the same page as Mr. Travers' letter
ars a letter from Mr. Yerbury, speaking
the Licentiate class, to the last part of
graph 3 of which I earnestly crave the
ntion of the members of the Royal Insti-
I gather, moreover, from this letter that
e is to be a referendum to Licentiates.
us appears that the Council have granted
he Licentiates something they refuse to
the corporate members.
here are certain statements in the Council's
lar which cannot be allowed to pass.
o. by the way, is paying for all this elec-
propaganda?) Mr. Shortt, K.C., says
after amalgamation the whole profession
ld speak with one voice; he cannot, there-
be aware that there are large numbers
nattached architects in the country, and
there is considerable apathy and even
osition towards registration among many
he leading men of the profession. More-
, both the question and the opinion are
that it is an insult to the intelligence of
members to hold this out as an induce-
t.
very Associate should strenuously protest
nst the lapsing of the Council from the
ertaking given for many years past that
affix "L.R.I.B.A." would not be
ntenanced.
ssociates will have a lively recollection
although pressed for many years past,
section of the Institute of which the
ent Council is the mouthpiece have con-
ed the right of Associates to have equal
ng powers with the Fellows. They have
however, promised the Licentiates this
ilege over the heads of the Associates! By
porting the Council's scheme, therefore,
ociates will be electing as members 5,000
ualified men who will have greater voting
ers than they themselves now possess.
he Council are not content with this, but
want to increase the representation of
Allied Societies. This is already too strong,
ng that they are a burden of expense to
Institute. (I believe the actual cost of the
d Societies to the Institute is over £400
annum.) The figures for the last year
r that out of a total of about 4,000 mem-
of the Allied Societies only about 1,000
qualified architects. It would seem, there-
that the Allied Societies are sufficiently
served with no less than nine representa-
on the Council of the Institute.
owhere do the Council give the slightest
rance that registration will be obtained
his generation, or even in this century,
propose a scheme which, while it brings
no nearer registration, will certainly
k the Institute as at present constituted.
Royal Institute does now stand for some-
g. It has a Royal Charter and a member-
of over 3,300 educated and qualified men
posing the flower of the profession. All
is being put in jeopardy by a band of
tics who are prepared to barter their trust
the bubble Registration.
embers of the Royal Institute should resent the action of the present Council in refusing to obtain the feeling of the Institute members by means of a referendum. This refusal is based on the foolish quibble that they are inhibited from this course by our charter. (This is a case of the devil misquoting Scripture.) Members of the Institute are forced thereby into voting against some of the best men in the profession. Thus the morbid and sinister political campaign which is now rife is accentuated by the Council's action, while a referendum would have been absolutely final and would have brought peace in our time among all parties in the Institute.

Associates should not lose sight of the fact that the splendid array of names on the Council's house list represents men who will not suffer the crushing effects this dilution will have on those commencing a career. Associates should ponder whether the vicarious sacrifice made by these elect gentlemen may not be a little beyond their victims' powers of endurance.

The Council, of course, have had no mandate to open negotiations with the Society. The position is that there is a Registration Bill before the Institute, consideration of which the general body decided to postpone in order to obtain the Allied Societies' views.

I should have liked the Council to have told members how the conferring of diplomas on 5,000 unqualified men will help "the improvement and elevation of the professional status and the advancement of the Art" (of Architecture).

PERCIVAL M. FRASER.

London.

[Mr. Fraser's letter reached us too late for our last issue, and we have had an opportunity of considering the points raised by him. Taking them in order, we believe we are correct in saying that:—

The fact is that the Allied Societies' Conference, by a unanimous vote, backed up by numerous meetings in the provinces, has agreed to this arrangement which is thought to be inconceivable.

By assuming that the societies will not agree to the scheme, but will insist on another which has not even been suggested, and by substituting this imaginary scheme for the Council's actual scheme, Mr. Fraser's figures are arrived at. There is nothing of the sort in the Council's scheme, and it could not come to pass unless it was put forward in a new charter and voted for by members. Even at that the figures are wrong. In the United Kingdom (which would be the only country affected by the Register) the number of members of Allied Societies unattached to the R.I.B.A. is far less than 2,000.

The Council took the opinion of the Licentiates by post-card because they have no votes either at general meetings or in the election. The voting members have the power of expressing their verdict first at the election and afterwards at two special general meetings.

Mr. Shortt was given these precise facts in writing—the numbers in the R.I.B.A., the numbers in the Allied Societies, and the numbers in the Society of Architects, and an estimate of the number of unattached architects. (See Mr. Shortt's second opinion, *p.* 780, in reply to the exact question selected by the Defence League.)

The Council do not "lapse from an undertaking." They simply give the Associates and members generally an opportunity of voting as to whether they want to make this change or not. The Council could not impose such a change. If it is made, it is made by the express vote of the general body at two general meetings.

This right of the Associates has been conceded by every Council that has been in office since the war. It was agreed to by the general body in 1923, and it is included in the Council's actual scheme in so many words.

The Licentiates get nothing "over the heads of the Associates." They will not be electing 5,000 men as members with greater voting powers than themselves. They will be voting for the admission of about 1,200 men with the same voting powers as themselves, and promoting 1,300 more to the same voting powers.

When the Allied Societies were first given representation they had nine seats on the Council, though there were only nine societies with a few hundred members. There are now 55 Allied Societies and branches with over 4,500 members, yet the Council only propose to increase their representation from 9 seats to 15, and all these representatives must be Fellows of the R.I.B.A.

A careful analysis of the membership of the Allied Societies was made only last year, and it showed that the non-architect members of the Allied Societies (honorary members, surveyors, and craftsmen, &c.) were about 1 in 100. Practically the whole membership consists of *bona-fide* members of the profession.

The Council cannot give assurances as to what Parliament will do. They can only give their opinion, backed by the opinion of the legal advisers of the R.I.B.A., and by the opinion of an eminent Parliamentary authority.

Mr. Fraser may regard registration as a "bubble." The profession as a whole does not. And the profession's opinion was shared not long ago by several well-known architects who now appear to be in opposition, at a time when the prospects of registration were not so good as they are now.

A postal vote has no power to settle anything, even if members voted 3,000 to 1. The proposals can only be adopted at a special general meeting, and they will be laid before a general meeting if the election shows that the Council retains the confidence of members generally.

The Council were not instructed to obtain only the Allied Societies' views, but "that the Bill be not considered until other professional societies and interests affected have been consulted and a general consensus of opinion obtained in favour of the Bill." These are the actual words.—ED.]

The R.I.B.A. Election.

SIR,—Fifty years of close acquaintance with the R.I.B.A., a recollection of every president, except one, may entitle me to express the hope that in the forthcoming important election of the council, and of the committees, the voters will take some pains to ascertain whether or not those for whom their votes are recorded are men who, by reasonable attendance at the council and committee meetings are likely really to work for the best interests of the general body, and for an increase even in the good estimation in which the R.I.B.A. is now held by the public.

The report of the council for this year contains the number of attendances of each member on the various committees (it would have been useful if it had also contained the number of attendances of members of council) and a persual of the figures will show what I mean.

The mere credential of a name, however eminent, is not likely to further the interests of the Institute unless the owner of it has made up his mind to attend to the work he has undertaken to perform.

I am not a candidate this year for the council nor for any of the committees, but I may repeat what I have been saying and writing of late, that there appears to be an inclination to be "patronised" by officialdom; that dilettantism is creeping into a body which should be essentially an artistic and a practical one; that 20 boards and committees—the number this year—rather supports my point of view, and leads me to hope that the new council and committees will be composed of men who will minimise those "embellishments," and get on with the useful work of the Institute in a practical manner.

WM. WOODWARD.

London.

MR. E. STANLEY HALL (President) occupied the chair at a general meeting of the Architectural Association on Monday last.

Two nominations for membership were announced, and Messrs. P. Rodeck and C. F. Cornelius were unanimously elected members.

House List.

The PRESIDENT then announced the result of the elections for the House List for the session 1924-5 as follows:—

PRESIDENT.—Mr. H. S. Goodhart Rendel.

VICE-PRESIDENTS.—Messrs. J. Alan Slater and L. S. Sullivan.

HON. TREASURER.—Mr. Gilbert H. Jenkins.

HON. EDITOR, *Architectural Association Journal*.—Mr. Manning Robertson.

HON. LIBRARIAN.—Mr. A. H. Moberly.

HON. SECRETARY.—Mr. M. T. Waterhouse.

PAST PRESIDENT.—Mr. E. Stanley Hall.

ORDINARY MEMBERS OF COUNCIL.—Messrs. W. H. Ansell, E. J. T. Lutyens, P. D. Hepworth, C. L. Gill, O. P. Milne, Philip Tilden, S. C. Ramsey, T. W. Newman, C. H. James, H. I. Merriman.

SWEDISH ARCHITECTURE.

MR. HAKON AHLBERG then lectured on "Modern Swedish Architecture," and illustrated his remarks with a number of lantern slides of past and modern architectural works in Sweden.

After expressing the thanks of the Swedish visitors for the kindness they had received at the hands of their English confreres during their stay in this country, he said Swedish architects had always admired the capacity of English architects to make their creations live and their attachment to national traditions. But at the same time they had admired the English in their refusal to be bound by the shackles of academic red tape—it was those qualities which had kept English architecture on safe and sound lines through all the changes of style and fashion. Modern Swedish architects strove after the same things, and by immersing themselves in their own traditions they endeavoured to lay sound foundations for their creations.

In considering the modern Swedish art of building, the ancient times and the Middle Ages were of hardly any real importance. It was, in fact, not until the beginning of the sixteenth century, when the country secured political security, that Swedish architecture became fully and consciously national. The seventeenth century, the era of Sweden's political greatness, was of more importance; it was in that century that the exterior architecture of palaces, mansions, and the houses of well-to-do citizens gained their typically old Swedish character, which was simple and dignified. The chief contribution of the eighteenth century was a refinement of that type of design and the development of interior architecture. The nineteenth century contributed scarcely anything of real value to the history of Swedish architecture. It was an unhappy time; it was the time of the expansion of towns and suburbs, and unfortunately had given many of those developments their stamp of stereotyped dulness and uncultured grandness.

With the last decade of the nineteenth century indications of a renaissance appeared. The man who was generally recognised as the pioneer of the modern school of Swedish architects was I. G. Clason, whose productions had been prolific, whose achievements in an official position had been considerable, and whose activities as a teacher had had a great influence. Clason had not striven to be an artist in the same way as the majority of architects who had faith in their own activities. He was first a builder, and had laid down laws for a sound architecture, suited to the times, and at the same time traditional. He had reached a high standard, and in his official activities he had imbued his laws with life. From the seed which Clason had scattered as a teacher there had sprung up vigorous plants which bore witness to its excellence, although he had not escaped the sower's bitter lot of seeing some strange and startling growths appear. He had waged a stubborn and successful fight against the use of inferior material and false construction, to which recourse had been had with fatal results during the period immediately preceding his activities; he had taken up arms for well-thought-out, logical, and solid construction; he had studied every detail, and carried out his work in a way almost unknown to his contemporaries; through the reliability and authority of his personality and the thoroughness of his work, he had earned from the architects of Sweden a confidence which, because of careless and shoddy work, they had nearly lost.

An interesting contrast to Clason, and representative of another stage of development, was Ragnar Ostberg, who belonged to a younger generation which was reaping where Clason had sown. The tendency to fixity of style in Clason was in Ostberg converted into a robust and sometimes revolutionary love for creating and recreating.

Between Clason and Ostberg were a number of good architects of distinctly individual type, and perhaps the most robust representative of that school was Carl Westman, whose work was characterised by austere sobriety and manly control.

In Ostberg's Stockholm Town Hall would be recognised many of the elements from old Swedish buildings. In that building there was a trace of realism which manifested itself in showing forth the materials naked and unadorned, and at the same time there was a trace of romanticism; but it was by no means an imitation—it was as original as possible both in its great lines and in its details, and most certainly it was a clever work. Stockholm was beautifully situated, and almost surrounded by water. The front of the Town Hall rose directly from the water, like the buildings at Venice, for Stockholm was a queen of the water as well as Venice. The front facing the water was of red hand-made bricks, reminding one of mediæval work. The spires and sculptures on the roof were gilded. In the banquet hall the walls were covered with mosaic, mostly gold. The pavement was of light green and black marble, polished to reflect the rich colours of the walls. A banquet in that hall, only lighted with candles on the tables, was indeed a magnificent sight. There were many startling effects in the building, although it looked simple in plan.

The recent history of Swedish architecture could be summarised as follows: First a technical renaissance which expressed itself in the condemnation of inferior materials and false construction; then a stylistic renaissance which rejected academic and hackneyed conventionalism, and aimed at individual and national forms suited to the particular purpose in view. That period had certainly made one of the happiest and one of the most valuable contributions to the history of Swedish architecture during the past century. Naturally they occasionally met with exaggerations, but a trend towards classical ideals, towards a stricter and more law-abiding style, could now be discerned. That change did not, of course, appear as connected or intentional; the new trend was, at first, hardly discernible, and was introduced by men of very moderate tendencies.

From the technical point of view the contributions of the most recent years were perhaps not of the same importance as those of the first years of this century, but the pure and strict form which had followed on the ideal of the younger school suited the modern technique extremely well. Modern Swedish architecture did not aim at being a direct expression of construction such as was sought after at the beginning of this century—especially in Germany; it rather sought after a cultivated form in the solution of the whole architectural problem, and not principally in construction, which must be a subservient factor. The cultivation of the formerly despised branches of architecture, such as interior decoration and handicrafts, was one of the most important contributions of the younger generation of Swedish architects, and the quality of modern Swedish handicrafts might in no small degree be ascribed to the influence of architects.

In conclusion, he extended a cordial invitation to English architects to visit Sweden to see what architects were doing in that country.

A hearty vote of thanks to the lecturer was proposed by MR. GOODHART RENDEL and seconded by SIR LAWRENCE WEAVER, both of whom complimented him on the excellent manner in which he delivered a difficult lecture in a foreign language.

MR. IVAR TENGBOM said they in Sweden were very glad to receive the invitation of the A.A. to hold an exhibition of Swedish architecture in London, as they deeply respected the works of English architects. Architecture could not be expressed at all except through the actual building, and he hoped they would find sincere work behind the drawings in the exhibition.

The vote of thanks was carried with acclamation.

YORK ARCHITECTURAL SOCIETY

THE annual meeting of the York and East Yorkshire Architectural Society was held at York recently. The chair was taken by Mr. Stephen Wilkinson, F.R.I.B.A., the President. Amongst those present were Messrs. J. M. Dossor (Hull), T. Snowden (Hull), S. G. Highmoor, E. A. Pollard, J. S. Syme, S. R. Kirby, C. W. C. Needham, S. Needham, S. Low, T. H. Cliffe, J. P. Wilde, D. Robinson, W. O. Noble and J. E. Reid.

Mr. Stephen Wilkinson was re-elected President, and Messrs. J. M. Dossor and Alan H. Munby (London) Vice-Presidents. The following members were elected to serve on the Council:—Messrs. George Benson (Easingwold), A. B. Burleigh, C. H. Channon (Malton), G. H. Harbon (Hull), R. Jackson, S. R. Kirby, Llewellyn Kitchen (Hull), G. Leckenvy, H. Monkman, C. W. C. Needham, S. Needham, A. Pollard (Scarborough), T. Snowden (Hull), J. Stewart Syme, W. S. Walker (Hull), T. W. Whipp (Scarborough), and F. T. Penty. Mr. J. E. Reid was re-elected Hon. Secretary, and Mr. E. A. Pollard Hon. Treasurer. Messrs. S. G. Highmoor and A. Cowman consented to act as Hon. Auditors. At the meeting several excellent suggestions were adopted, and it was resolved to pay visits to buildings of interest in the county, and to give a series of lectures by architects on popular subjects. It was also resolved to adopt a presidential badge, and several sketches were laid before the meeting.

Messrs. Arvid Fuhre, Hugo Jahnke, Conny Nyguist & Karl Samuelson, Architects.

Swedish Architecture Exhibition.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS

The Proposed Amalgamation.

The following resolution has been passed unanimously by the Councils of the following allied societies :—

Ulster Society of Architects.
Liverpool Architectural Society.
Nottingham and Derby Architectural Society.
Northamptonshire Association of Architects.
Glasgow Institute of Architects.
Manchester Society of Architects.
Berks, Bucks, and Oxon Architectural Association.
South Wales Institute of Architects.

"That the Council of the . . . note with regret the attitude of certain members of the R.I.B.A. who seek once again to place obstacles in the way of a union between the two principal architectural bodies in the country.

"The Council of the . . . assure the Council of the R.I.B.A. of their whole-hearted support in the effort that is being made to obtain unity in the profession."

The following resolution has been passed unanimously by the Councils of the following Allied societies :—

The Northern Architectural Association.
The Gloucestershire Architectural Association.

"The Council of the . . . assure the Council of the R.I.B.A. of their whole-hearted support in any effort that is being made to obtain unity in the profession, and await with interest any scheme to further this object."

The following members of the Allied Societies' Conference, who were unable to append their names to the letter sent out before Easter to members of the R.I.B.A., and signed by the members of the Council and by members of the Allied Societies' Conference, have informed the Secretary of the Royal Institute that they desire to support the Council's proposals :—

J. Leighton Fouracre, President, Devon and Exeter Architectural Society.

G. D. Oliver, Chairman, Cumberland Branch, Northern Architectural Association.

D. W. Galloway, President, Dundee Institute of Architects.

W. S. Purchon, Past-Chairman, Central Branch, South Wales Institute of Architects.

C. F. Ward, Chairman, Eastern Branch, South Wales Institute of Architects ; also Vice-President of the South Wales Institute of Architects.

Frank S. Swash, Vice-Chairman, Eastern Branch, South Wales Institute of Architects.

Mr. T. Alwyn Lloyd, Chairman, Central Branch, South Wales Institute of Architects.

G. Vincent Evans, Chairman, Northern Branch, South Wales Institute of Architects.

Letters sympathising with the registration policy of the Institute have also been received from Messrs. Oscar Wilson, hon. sec. of the Singapore Society of Architects ; S. M. Eveleigh, president of the Architectural Institute of British Columbia ; G. A. Roberts, of Sydney ; Storey and Van Egmond, of Regina, Canada ; and from William P. Bannister, of the State Department of Education, the University of the State of New York.

Up to May 9 replies had been received from 716 Licentiates who were asked to express their opinion on the Council's proposals—of these, 19 were not in favour, and 697 were in favour.

Election Circular.

The following letter has been sent to the electors of the R.I.B.A. :—

"DEAR SIR,—Last year, by an overwhelming majority, a really representative Council was elected to try and come to some satisfactory solution of the unfortunate impasse which had been reached upon the question of registration, and our relations with the Society of Architects. We believe that the proposals now submitted by this Council will, if carried, be of the greatest value to the profession in the future, and ensure an end to the unfortunate disputes of recent years. We, therefore, ask you to give your votes at the Council Election to the Candidates who are named on the opposite page, all of whom have been nominated by the present Council, and support their proposals in full."

This letter is signed by six Past-Presidents, 66 Presidents and Past-Presidents of Allied Societies, about 180 Fellows, and nearly 300 Associates.

The following list of candidates is appended to the letter :—

PRESIDENT : Gotch, John Alfred.

VICE-PRESIDENTS :

Barnes, Major Harry.	Dawber, Edward Guy.
Buckland, Herbert Tudor.	Lutyens, Sir Edwin Landseer, R.A.

HON. SECRETARY : Keen, Arthur.

ORDINARY MEMBERS OF COUNCIL :

Adshead, S. D.	Keppie, J.
Ashley, H. V.	Lanchester, H. V.
Burnet, Sir J. J.	Monson, E. C. P.
Cave, Walter	Rees, T. T.
Corlette, H. C.	Sadgrove, E. J.
Fletcher, Sir Banister F.	Scott, G. Gilbert.
	Thomas, Sir A. Brumwell.
Fletcher, H. M.	
Green, W. Curtis	Thomas, Percy E.
Jones, F.	Verity, F. T.

ASSOCIATE MEMBERS OF COUNCIL :

Bagenal, Hope	Budden, L. B.
Bradshaw, H. C.	Slater, J. Alan.
Bucknell, L. H.	Waterhouse, M. T.

[The list of candidates nominated by the Defence League is given on p. 782.]

The R.I.B.A. and the Defence League.

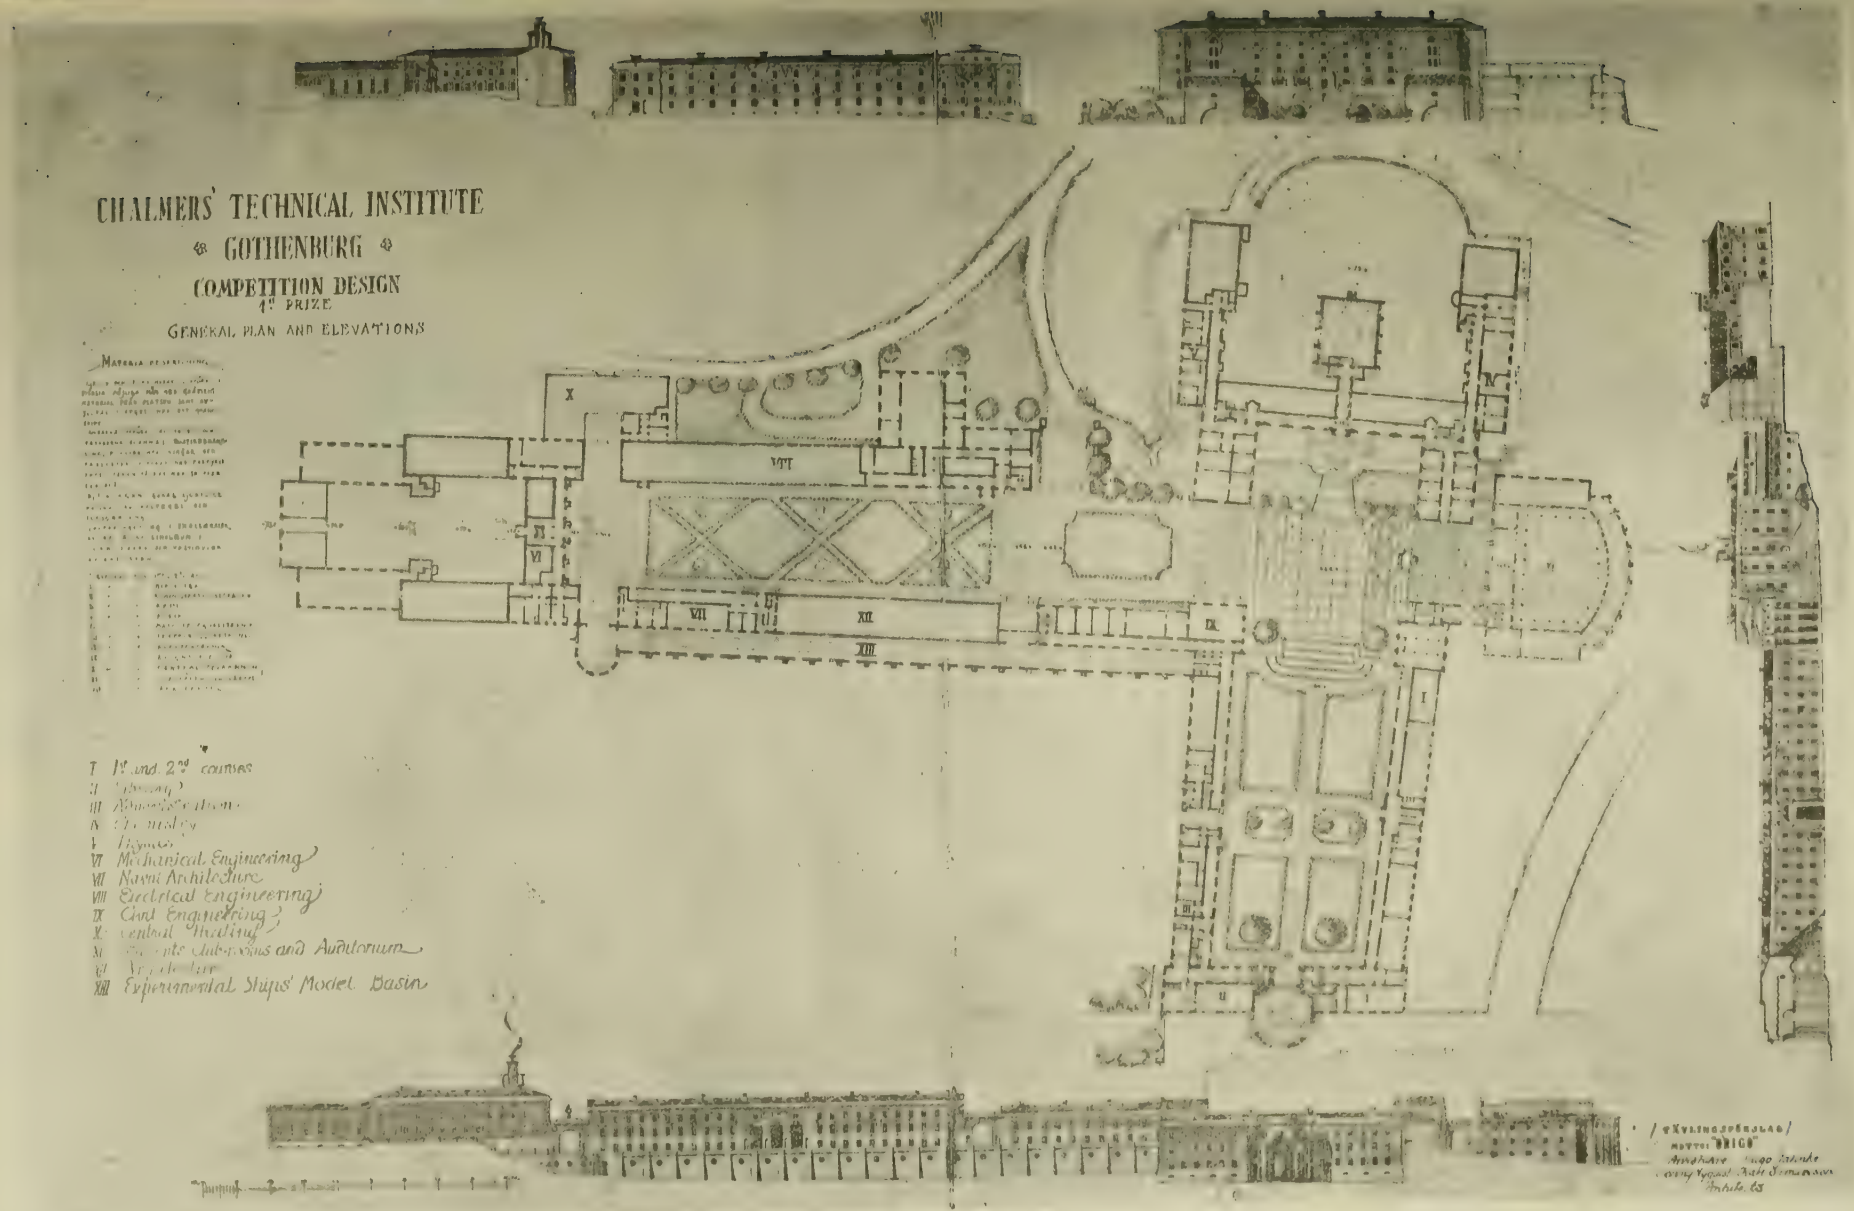
At the suggestion of the Council of the R.I.B.A., on March 17 Mr. J. A. Gotch (President) wrote to Mr. A. W. S. Cross asking whether a meeting between representatives of the R.I.B.A. Council and the Defence League might not be desirable with a view to avoiding the differences which occurred at the last two Council elections. A meeting was held on March 27, when the representatives of the Defence League suggested that a referendum should be taken, and on April 2 Mr. Gotch wrote, stating that the Council intended to put its proposals before the electorate, which was the only form of referendum available under the constitution of the Institute. The Defence League objected to this course, and expressed a preference for a referendum, in reply to which the R.I.B.A.'s Council informed the Defence League that it could not see its way to alter its previous decision to place the whole matter before the general body at the forthcoming election.

Architects and National Housing.

MR. WHEATLEY, Minister of Health, recently received a deputation from the Royal Institute of British Architects and Allied Societies on the question of national housing. The deputation was introduced by Mr. J. Alfred Gotch, the president of the Institute, and views of the architectural profession were expressed by :—Major Harry Barnes (Vice-President, R.I.B.A.), Mr. H. V. Lanchester, Professor S. D. Adshead, Mr. G. C. Lawrence (President of the Wessex Society of Architects), Lt.-Col. G. T. Reavell (Northern Architectural Association), Mr. T. Alwyn Lloyd (South Wales Institute of Architects), Major H. C. Corlette (Federal Council of Australian Institutes of Architects), Professor Patrick Abercrombie, Mr. Paul Waterhouse.

The deputation desired expressly to emphasise the importance of architects and the Institute being represented in any statutory or other Committee which might be set up in connection with the carrying out of a Government scheme. They also desired to lay stress on the importance of trained architectural advice being sought in the carrying out of housing schemes from the points of view of securing economy, efficiency, and grace of design.

Dealing with the Report of the Building Committee, the speakers endorsed the recommendation that a long-term programme of house building should be undertaken. They had grave doubt whether in the long run a advantage would be gained from any syst of dilution which did not aim at produc trained craftsmen. They felt that it was the greatest importance that an appro standard of housing would be maintained extended.



The Minister (Mr. Wheatley), in re thanked the deputation for putting before the views of a body of such importance assisting at arriving at a proper solution the difficulties of the problem which he had hand. He assured the deputation that he no intention of departing from the system competitive tenders or from the principle free trade in the supply of materials. pointed out that the control of actual build would largely be in the hands of local auth ties, but he recognised fully the desirability bringing trained skill to bear on the proble He had not yet arrived at a final decision the functions and composition of the Co mittee which had been mentioned, but he noted the wish of the Institute for represen tion on it, and would not fail to consider it

The following were invited to take part the deputation :—

Council.—Mr. J. Alfred Gotch (Preside R.I.B.A.), Mr. Paul Waterhouse (Past-Pre dent, R.I.B.A.), Mr. John W. Simpson (Pa President, R.I.B.A.), Mr. Herbert T. Bu land (Vice-President, R.I.B.A.), Mr. E. G Dawber (Vice-President, R.I.B.A.), Mr. Curtis Green (Vice-President, R.I.B.A.), Robert Atkinson, Sir John J. Burnet, Edwin Cooper, Major H. C. Corlette, Banister Fletcher, Mr. Henry M. Fletch Mr. Gilbert Fraser, Mr. John Keppie, Edwin Lutyens, Mr. Thomas R. Milbur Mr. G. Gilbert Scott, Mr. Walter Tapp Sir A. Brumwell Thomas, Mr. Percy Thomas, Mr. Maurice E. Webb, Mr. Chalton Bradshaw, Mr. W. G. Newton, Michael Waterhouse, Mr. J. Hubert Wor ington, Mr. Eric Morley, Mr. E. Stanley H

Housing Committee.—Mr. Henry V. Ashl Major Harry Barnes, Mr. Walter Cave, G. C. Lawrence, Mr. Horace Cubitt, Mr. Leonard Elkington, Mr. W. G. Hunt, Herbert A. Welch, Mr. George H. Gray, Aston Webb, Mr. Wm. Harvey, Mr. Fran Jones, Mr. T. Alwyn Lloyd, Mr. James Lo head, Mr. C. B. Willcocks, Professor S. Adshead, Mr. W. R. Davidge, Mr. F. Elgood, Mr. H. V. Lanchester, Mr. Raymo Unwin.

Representative of Allied Societies.—M Edward P. Warren (Berks, Bucks and O Architectural Association), Mr. Rupert Sav (Birmingham Architectural Association). J. Leighton Fouracre (Devon and Exe Architectural Society), Sir William Por (Hampshire and Isle of Wight Association Architects), Mr. W. Alban Jones (Leeds West Yorkshire Architectural Society), Mr. Stockdale Harrison (Leicester and Leicest shire Society of Architects), Mr. E. B. Ki (Liverpool Architectural Society). Mr. A. Hope (Manchester Society of Architects). S. F. Harris (Northamptonshire Associat of Architects), Mr. E. H. Heazell (Nottingh and Derby Architectural Society), Mr. E. Boardman (Norfolk and Norwich Associat of Architects), Mr. W. T. Jones (North Architectural Association), Mr. T. P. Marw (Incorporation of Architects in Scotland). R. G. Wilson (Aberdeen Society of Architect Mr. D. W. Galloway (Dundee Institute Architects), Mr. C. G. Soutar (Dundee In tute of Architects), Mr. J. Inch Morri (Edinburgh Architectural Association). G. A. Paterson (Glasgow Institute of Ar tects), Mr. Alexander Grant (Inverness Ar tectural Association), Mr. H. L. Pater (Sheffield, South Yorkshire and District Soci of Architects and Surveyors), Mr. Percy Thomas (South Wales Institute of Architect Mr. W. S. Skinner (Bristol Society of Ar tects), Mr. G. P. Milnes (Gloucestersh Architectural Association), Mr. Stephen V kinson (York and East Yorkshire Archit tural Society), Mr. R. M. Young (Uls Society of Architects).

Morgan Grenfell Bank.

Messrs. Morgan, Grenfell & Co. are acquiring two buildings of different design, and the scheme illustrated shows how it is proposed to re-front the elevation in Portland stone and unify the design. The entrance doors, as well as the window bars, will be in bronze. A new banking hall will be designed for the ground floor, which will be lowered to give extra height. This will necessitate considerable alteration in planning to the floors above. The work is to be carried out by Messrs. Trollope & Colls, Ltd.

Messrs. Mewès & Davis, FF.R.I.B.A., are the architects. Our illustration is from the Royal Academy Exhibition.

New Offices for P. & O.

This detail drawing shows the elevation of these premises in St. Mary Axe, E.C. The area wall and plinth are in granite and the whole of the upper part of the building in Portland stone. The roof is covered with green slates in graduated courses, the dormers, hips and curbs to roof being in cast lead.

The general contractors for the work are Messrs. Trollope & Colls, Ltd., of Coleman-street, and the following is a list of the sub-contractors:—Henry Hope & Sons, cast lead work; James Gray, Ltd., heating; W. Richardson & Co., windows; Electrical Installations, Ltd., electric light; Burke & Co., and Belman, Ivey & Carter, marble work; Brookes, Ltd., granite work; Faldo & Co., asphalte; G. Jackson & Co., plaster decoration; Birmingham Guild, Ltd., bronze entrance door; H. W. Cullum & Co., hollow block floors; Waygood-Otis, Ltd., lifts; plumbing and sanitary work, Matthew Hall & Co. The stone enrichments were modelled and carved by Mr. P. G. Bentham, of Stamford Bridge Studio.

The whole of the work has been designed and carried out under the supervision of Mr. Stanley Hamp (Collcutt & Hamp), 126, Wigmore-street, W.1. The original drawing is by Mr. R. S. Dixon, and is exhibited at this year's Royal Academy.

Vigo House.

This building forms the Vigo-street end of a block of buildings which will eventually have a frontage on Regent-street from Vigo-street to Heddon-street, the design used in the façade of the present building being carried on and used for the whole block. It was found that with the new floor heights the resultant elevational "grid" lent itself more definitely to treatment in a modern than in a conventional manner. A strong horizontal lintel marks the second-floor level, above which a vertical treatment is obtained by the use of simple stone piers carrying a projecting cornice at the fifth-floor level, and emerging through this till they reach the eaves level at the sixth floor. A circular corner in which tall columns take the place of piers, and support, above the cornice level, a battered drum and dome, forms the important motive at the junction of Vigo and Regent streets. This feature will also be repeated on the Heddon-street corner, thus affording massive terminals to each end of the completed facade as viewed from Regent-street. The stonework throughout is worked to simple mouldings with incised enrichments. Rich bronze balustrades at the first-floor level, bronze entrance doors and shop-front detail, and specially designed metal windows throughout are provided to give a contrast to the simplicity of the stonework. High polished green Swedish granite, capped with a 2-ft. wide band of polished black Belgian marble, forms an effective base to the structure above, which is in Portland stone throughout.

Sir John Burnet, A.R.A., and Partners are the architects, and our illustration is from the Royal Academy Exhibition.

The sculpture work was executed by Mr. Reid Dick, A.R.A.; and the modelling and stone carving by Mr. George Alexander. The general contractors are: First operation, Messrs. Trollope & Colls; second operation, Messrs. P. & W. Anderson. The sub-contractors are: Messrs. R. A. Skelton & Co., steelwork; Messrs. Diespeker & Co., patent floors; Messrs. Fenning & Co., granite and marble; Messrs. Crittall Manufacturing Co., steel windows; Messrs. Crittall Freeman Bronze, Ltd., shop fronts, lift grilles, &c.; Messrs. Carter & Co., terrazzo and mosaic floors; Messrs. Young, Austen & Young, heating; Messrs. Tyler & Freeman, electric lighting; Messrs. Shanks & Co., sanitary fittings; Messrs. Waygood-Otis, lifts.

Proposed Business Premises in the City.

The basement, ground floor, entresol and first floor of this building are to be occupied by a bank, with staff luncheon rooms in the roof. The four upper floors will be available for private offices. The lower part of the facade is to be faced with Swedish marble, and the upper part with thin red facing bricks, and the roof covered with Roman type tiles.

Mr. Oliver Hill is the architect. Our illustration is from the exhibit at the Royal Academy Exhibition.

Coulsdon and Purley U.D.C. Town-Planning Scheme: Bradmore Green.

This illustration is from the Town Planning Institute Exhibition in the Palace of Arts, at the British Empire Exhibition, and shows how a proposed shopping centre ar a village green should look when develope private enterprise in accordance with the t planning scheme which is being prepare Messrs. Allen & Potter, 11, Arundel-st W.C.2.

SOUTH WALES INSTITUTE OF ARCHITECTS

Mr. C. F. Ward, F.R.I.B.A., Chairman of the Eastern branch, South Wales Institute of Architects, and vice-president of the South Wales Institute of Architects) presided at the third annual dinner of the Eastern branch at Newport recently. There were also present Mr. Percy Thomas, O.B.E., F.R.I.B.A. (president, S.W.I.A.), Mr. Ivor Jones, F.R.I.B.A. (hon. secretary, S.W.I.A.); Mr. C. E. Tebbs, A.R.I.B.A., Mr. W. S. Purchon, M.A., F.R.I.B.A., and Mr. R. H. Winder, M.A., F.R.I.B.A.; Mr. A. Lovelock (president, Building Trades Employers' Association); Mr. Horace Jones, M.S.A. (hon. secretary, Newport branch, S.W.I.A.), and Mr. J. H. Daniels (assistant secretary).

The President, proposing the toast of the guest of the evening, Mr. C. E. Tebbs, said they all regretted he had felt compelled to resign. He was appointed secretary on the formation of the branch in 1915, but before then he was a member of the Doric Club in 1910-11, a club which had done much for architecture in Newport. Students of the present day hardly seemed to appreciate the importance which the meetings of the Institute had in the life of the young architect, but he assured them that they were most valuable. On behalf of the members he had pleasure in presenting Mr. Tebbs with a silver cigarette casket.

Mr. Tebbs, responding, expressed his appreciation of the gift. He congratulated the Institute on the progress that had been made towards registration, and urged students to continue their studies until they had obtained the diploma of the R.I.B.A. That would prevent them becoming architectural hewers of wood and drawers of water.

Proposing the "Royal Institute of British Architects and Allied Societies," Mr. Frank Swash, Newport, said that the main object of the Institute was the education of their own members and of the general public. As an Institute they were on the eve of big things, the result of which would be the upraising of the profession. As an Institute they had 5,483 members, but there were 24 allied societies, which made their membership much greater. They also had organisations and branches throughout the Colonies and Dominions. There was a scheme on foot for the amalgamation of the R.I.B.A. and the Society of Architects, and this would be for the benefit of the profession as a whole.

Mr. Percy Thomas, responding, said they had suffered much in Wales from want of opportunities for their students. More good would come to Newport from one properly trained architect than from 99 grants from the Board of Education. As regarded the unity of the profession, the R.I.B.A. did not, at present, represent the whole of the profession. The object of unification was the promotion of a Registration Bill in Parliament, but whether they were able to do this or no, the unification of the profession was a worthy end in itself and would be of immense advantage.

Mr. R. Fisher proposed the visitors and the Building Trades Employers' Federation.

Mr. A. Lovelock responded, and congratulated the branch upon the unity of their association, and the enthusiasm they had displayed. He then proposed the health of the chairman.

Mr. Ward, responding, thanked the members for the support they had given him, and appealed for even greater enthusiasm and service in the future. They were making great progress both as an institute and for the improvement of the profession.

Mr. W. J. T. Collins, replying for the visitors, said that among the things that made for the good of Newport was that they should have in their midst buildings of which they could be proud. He hoped that the members of the profession would hold fast to their ideals, and do their utmost to bring back to Newport and Monmouthshire the glories of the architecture of the past. The last word in architecture had not yet been said, and it was for them to educate the public to understand the new lines of beauty in the buildings they designed. For this education was necessary, and he hoped this would be recognised by the public generally, so that the Newport which they loved would be made a town worth living in and one of which they could be proud.

ARCHITECTS' BENEVOLENT SOCIETY

On May 13 the Architects' Benevolent Society held their seventy-fourth annual general meeting at the rooms of the Royal Institute of British Architects. In the absence of the President Mr. W. Hilton Nash was in the chair.

After the minutes had been read the Hon. Secretary read the annual report, from which we take the following extracts:—

The sum of £1,477 18s. 6d. has been actually expended during the year under review. In addition, £407 has been paid out in pensions to the Society's pensioners. Subscriptions have maintained a high level, a total of £1,106 0s. 6d. having been received. The Society's scheme of Professional Insurance, by which architects may insure their lives through the Society and thereby donate the commission, or half of it, to the Benevolent Fund, has been progressing steadily during the year. In February, 1923, a circular letter was sent to all members of the Royal Institute of British Architects, the Society of Architects and the Architectural Association, to Presidents of Allied Societies, Directors of Architectural Schools, and to the whole of the architectural press; and it was followed in May by a circular from the Society's Assurance Company which was sent out with the annual report, and later as an inset in the R.I.B.A. *Journal*. The results were encouraging. Up to date, thirty insurances have been effected and a total of £10,136 has been insured. £51 16s. has been received by the Society in commission, and £41 16s. has been returned to the insured. In addition, the sum of £39 12s. has been paid to the Society by the Assurance Company as a sliding scale commission on the total for the first year.

In place of Sir William Emerson, who resigned his position as a trustee of the Society, the Council has the pleasure to nominate Mr. Paul Waterhouse, M.A.Oxon, F.S.A., P.P.R.I.B.A.

The Council regret to report that the Society has lost by death many supporters during the year, including Sir Ambrose Poynter, Bart., the Rev. W. F. Yates Rooker, Mr. Walter Burrows, Mr. Arthur Clyne, Mr. William Cooper, Mr. Ernest Flint, Mr. Arthur Harrison, Mr. E. Haslehurst, Mr. R. H. Kerr, Mr. George Lethbridge, Sir James Lemon, Mr. Sidney Muggeridge, Mr. A. E. Murray, Mr. George H. Paine, Mr. Marshall Robinson, Mr. A. E. Sawday, Mr. T. F. Tickner, Mr. W. Henry Ward, and Mr. W. E. Willink.

The Council have the pleasure to acknowledge their great indebtedness to the Royal Institute of British Architects for the use of office accommodation, and to Mr. MacAlister and the staff of the Institute for courteous help on all occasions.

Mr. Hilton Nash then moved the adoption of the report, and said he considered they should get more help from the architects, many of whom, although in good positions, did not subscribe. The election of Council for the year of office 1924–25 was as follows:—President: Mr. J. A. Gotch. Vice-president: Mr. Thomas Dinwiddy.

Ordinary Members: Mr. William Grellier, Mr. Osborn C. Hills, Mr. George Hubbard, Mr. L. S. Sullivan, Mr. A. Saxon Snell, Mr. H. L. Anderson, Mr. Albert E. Kingwell, Mr. W. Campbell Jones, Mr. C. H. Brodie, Mr. Digby L. Solomon, Mr. W. Henry White, Mr. Maurice E. Webb, Mr. R. Dircks, Mr. E. J. Partridge (representing the Society of Architects), Mr. E. Stanley Hall (representing the Architectural Association), Mr. Henry Lovegrove (representing the London Society).

Votes of thanks were then passed to Mr. W. Hilton Nash for his services as hon. treasurer, Sir Charles Nicholson for his services as hon. secretary; and to the retiring hon. auditors, Mr. C. H. Brodie and Mr. Henry Lovegrove.

AUCTIONEERS' AND ESTATE AGENTS' INSTITUTE

The Registration Bill and the Housing Question.

At the annual meeting of the Auctioneers' and Estate Agents' Institute—the President (Colonel G. E. Kent, J.P., of Portsmouth) in the chair—the Council reported that the position as to the Registration Bill was one which called for patience. Although the Bill was introduced into Parliament early in the year, it failed to reach the stage of Second Reading, being crowded out by measures deemed to be of more general public importance. The nature and extent of the opposition to the Bill had, however, been disclosed, and discussions and conferences with all the opposing bodies had been in progress and were continuing. While the Council was prepared to make reasonable concessions so long as they did not interfere with the fundamental principles upon which the Bill was based, a firm stand would be made when those principles were involved. It appeared that some considerable time might be taken up in these negotiations, and that the Bill might ultimately require a certain amount of redrafting before it was in a condition to be re-introduced into Parliament. The Council regarded this matter as being of such vital importance that the final revised draft of the Bill would be submitted to the members of the Institute, through the branches, for approval before the measure was re-introduced into Parliament. The progress must necessarily be slow, but the contents of the Bill were so vital to the profession that the Council felt fully justified in proceeding slowly and cautiously in order that no false step might be made. The report of the Council was adopted.

Speaking at the annual dinner, Sir William Joynson-Hicks (late Minister of Health) said he desired to make a serious appeal to that great Institute and its Council in regard to a question he had very much at heart—the housing question. He thought there was no body of men who had such knowledge of the housing question and its difficulties as they had. Every day and every week many of them were dealing with houses from one point of view or another. The housing question was one of the questions that had to be solved, and it seemed almost insoluble. He was not going to touch upon the housing question from a political point of view, though he was not sure from what the Solicitor-General had said of his affection for the Guilds of the Middle Ages with the idea of enlisting the bricklayer in a vocation, that it would not be well for the Solicitor-General to transfer himself to the office he (Sir William) had held of Minister of Health, and induce the bricklayer to lay even a moderate amount of bricks per day, which would go very far towards solving some of the difficulties of the housing problem. The difficulty was almost insoluble because they were up against the fact that they must have houses built, and they could not get houses built while the restrictions were on, and they could not take the restrictions off until the houses were built. That was really a kind of vicious circle in which, unfortunately, politicians from time to time revolved. It was just as important to one party as to the other to solve this great difficulty.

Mr. Charles Osenton (Leatherhead) has been elected President of the Institute for the ensuing year in succession to Colonel Kent.

WN - PLANNING CONFERENCE AND EXHIBITION

O the second day of the Conference the
al at the first session was taken by Alder-
n Thos. Turnbull, D.L., J.P. (Chairman,
nchester District Town-Planning Com-
tee), who, in introducing Professor Aber-
mbie, gave a brief address on town-plan-
g principles and an account of the work
ich was being carried out in the Manches-
district.

Professor Abercrombie, in the course of his
ss on "Planning Industrial Regions," said
at for the purpose of general considera-
n the subject could be divided into two
s of "region." First, that in which the
ering of industry had been clearly de-
ated and where a series of industrial
munities were showing signs of coalescing
o a single urban mass; second, that in
ich industry had hitherto been absent, or,
any rate, only an appendage here and
re but where, from sudden cause, an in-
tial expansion was imminent. These two
ic areas could be briefly defined as the
ising Industrial Region and the Potential
ustrial Region.

It seemed to him that the solution of the
blem of the factory areas was a twofold
e—1) the regulation of the factory areas
emselves so that they should not be a nuis-
ce to neighbours, with special reference to
ok abatement; (2) the second solution
sisted in the provision of permanent open
ace, and thus preventing the towns from
ous coalescence. This open space need not,
doubt, be used for recreation purposes, and
uld be selected as far as possible to use
nd that was unsuitable for building, or
ich would be specially suitable for allot-
nt. Also it might be pointed out that the
crease of publicly owned golf courses pro-
cedsome return on the purchase price and
uldise up odd-shaped or elongated stretches
land.

Professor Abercrombie said it was remark-
ble that in the three Midland industrial areas
e largest towns—Manchester, Birmingham,
d Leeds—were not in the centre of the in-
strial region, but appeared to act as a
me, beyond which stretched the residential,
d, finally, rural surroundings.

After a brief reference to Sheffield and the
gional problem of London, Professor Aber-
mbie considered the case of new industrial
eas. These, he said, naturally gave much
re scope for regional planning. The con-
uctive plan was less likely to be regarded
an interference, and, indeed, was seen to
a plain necessity. Transport planning pro-
ded an easy step to prove the necessity for
gional zoning at the same time. This par-
ularly applied to districts such as the Don-
ster or East Kent regions. In both cases
e preservation of natural amenities during
dustrial or at any rate colliery development
as the prime factor in the scheme, and
s importance equal to the efficient industrial
anning itself. It was extraordinarily satis-
ctory to note the broad way in which the
dustrialists who were developing Kent's re-
urces realised and were aiming at this.

Continuing, Professor Abercrombie referred
the progress being made in Dee-side and
erse regions, and in his concluding re-
arks said it must be clearly stated that
gional planning was, for industrial purposes
any rate, something more definite than the
ere extension and combination of town-
anning schemes under the Town-Planning
cts, and should deal with the co-ordination
industry, railway planning, and the de-
lopment of industrial "parks," dock de-
gning, and reclamations among other things.
would seem that for certain purposes a per-
anent pooling of rates would be essential,
pecially in view of the concentration of in-
strial zones, for regional purposes, in the
eas of certain local authorities, and their
exclusion from those of others. They might indeed go further and state that if the full benefits of a progressive Industrial Regional Plan were to be realised action by Chambers of Commerce would be as important as action by local authorities.

Regional Planning.

Mr. Pepler (Chief Town-Planning Inspector, Ministry of Health) in his paper on "Regional Town Planning," briefly surveyed the initial stages in town planning and the gradual emergence of regional planning as a logical development of the principle established by the Act of 1909. Continuing, he said that an important feature of town-planning schemes must be the provision or preservation of adequate open spaces. These could only be retained if transport facilities were so planned as to prevent their development. There were thus two problems to be considered in town planning: (1) the provision of relief roads and arterial thoroughfares to take the traffic; and (2) the preservation of the "wedges" of open space or the park belts. If the main traffic routes were taken through the wedges, there was little doubt that in course of time these would become built-up areas. He thought the solution in this case was for the main traffic route to be taken—not through the centre of the open space, but close to the built-up area which adjoined.

With regard to regional planning, of late years much progress had been made; there were now 26 joint town-planning committees, of which the largest was the Manchester and District J.T.P. Committee, which included 73 local authorities, and dealt with an area of nearly 1,000 square miles. It was significant that many authorities had come into the scheme knowing that it was going to cost them something, which, he thought, was conclusive evidence that they considered town planning was a practical proposition. After making a brief reference to various regional schemes, Mr. Pepler said he would like to draw attention to the fact that the Joint Town-Planning Committee for East Kent, which included the whole of the local authorities in this area, had taken timely steps to preserve the amenities of this district. East Kent would, in the near future, become an industrial region, as the coal and iron deposits were to be developed. It was, therefore, a matter for congratulation that the authorities had unanimously agreed to ask Professor Abercrombie to prepare a report for a joint scheme for this area.

He thought that they were only at the beginning of things as regards regional planning, and the value of these joint committees, which were coming into existence all over the country, lay in the fact that not only did it result in joint action but also in joint thinking, directed to making the best possible use of the powers with which Parliament had endowed the local authorities in this country.

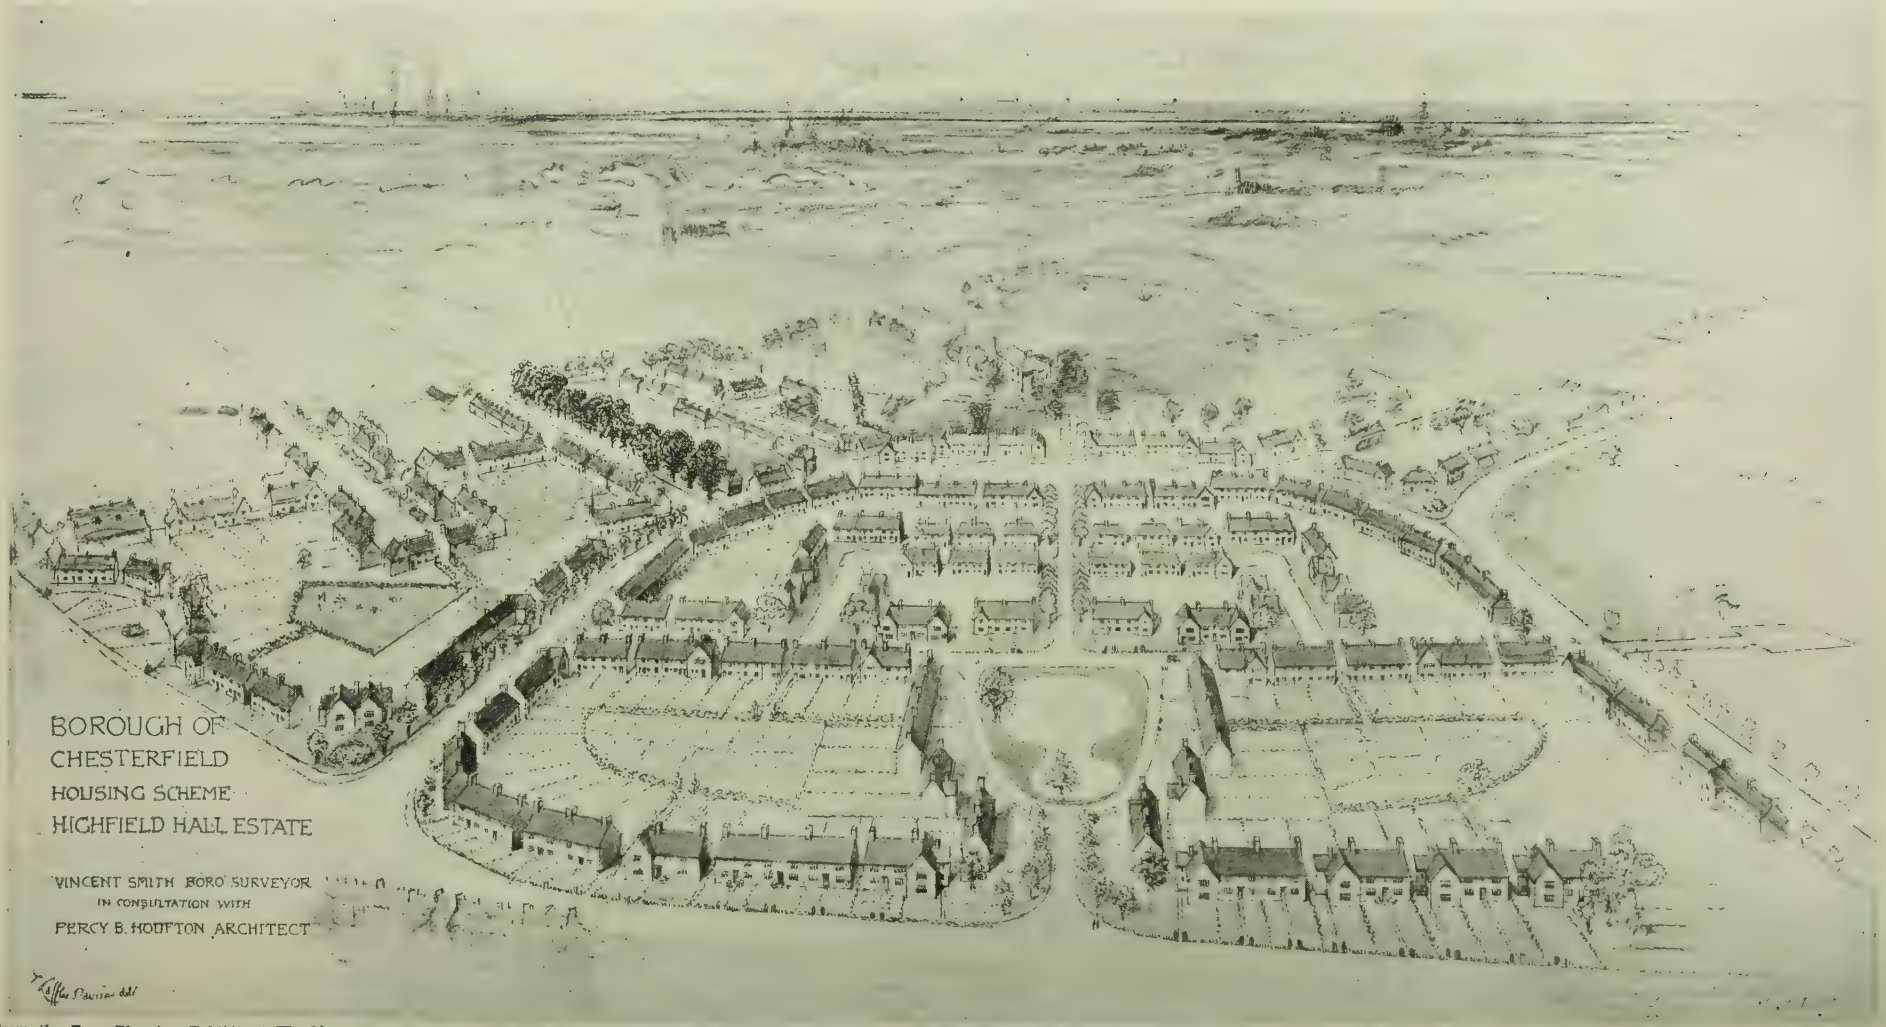
Ald. T. Turnbull (Chairman, Manchester and District Joint T.P. Committee), in opening the discussion said that he considered there was no work which local authorities were doing which was so important as town planning. They, in Manchester, were fully determined to carry on the work they had begun until their aim was achieved. He hoped that the result of these joint town-planning committees would make England the best kingdom in the world in respect of the conditions under which their people worked and lived.

Mr. Greenwood (Parliamentary Secretary, Ministry of Health), who took part in the discussion, said he came there as a member of a Government which had to live by co-operation, which was, perhaps, a good thing. He felt that there was no sphere of their work in which this spirit of co-operation was more required than in that of regional planning. If problems were to be effectively dealt with, it was necessary to look beyond the single local authority. He could assure the delegates to this important conference that the Ministry of Health would do everything possible to facilitate this co-operation between local authorities. He thought they could claim that the Ministry had, in the past, been foremost in pressing what he would call "the regional point of view." What was required, above all, was foresight—they must be able to look ahead for ten, twenty or fifty years, and see what the needs of the country would be. If England was to preserve and improve conditions and the standard of living, it was essential that they should conserve and develop their industrial and natural resources to the fullest possible extent.

In the discussion which followed, the questions of the possible decrease in rateable values consequent on development beyond municipal boundaries, the problem of smoke abatement, the conservation of objects of historical interest or natural beauty, and the representation of industrial interests on town-planning committees were debated.

Town Planning for Large Cities.

The afternoon session, under the presidency of Ald. T. O. Williams (Lord Mayor of Birmingham), was opened with a paper by Mr. Wiltshire (Town Clerk of Birmingham), on "Town Planning for Large Cities." Mr. Wiltshire, in his opening remarks, dealt mainly with the progress of town planning as it affected the development of industrial centres, and pointed out that Birmingham could claim to be the first to take advantage of the provisions of the Act of 1909, as their first scheme was approved in 1913. This was no doubt due to the influence of the late Mr. George Cadbury in the development of the Bournville Estate and the development scheme of the Harborne Tenants Estate, which was largely due to the action of Mr. John Nettlefold. Details with regard to these two schemes were given by Mr. Wiltshire, who then described the more recent developments in town planning undertaken by the City of Birmingham, and the formation of the Midlands Joint Town-Planning Advisory Council, which included some fifty-two local authorities and had to deal with an area having a radius of some twenty-five miles around the city of Birmingham.



Mr. Wiltshire next dealt with the special problems in relation to (1) built-up or central areas, and (2) wholly or partially developed areas, and described the procedure adopted in such cases, more especially with reference to questions such as laying out of arterial and other roads, open spaces, zoning and density, and the acquisition of land, &c., concluding his remarks with a brief reference to Town-Planning Acts abroad.

Mr. C. J. F. Atkinson, LL.B. (Town Clerk, Otley), read a paper on "Town-Planning Schemes for Small Towns," and in the course of his remarks said that he thought there was a possibility, with regard to the smaller towns and villages in industrial areas, that unless they made better use of their opportunities than their predecessors they would be absorbed by the large towns.

He wished to make a plea for the early application of town planning to all such small towns and villages. It was better to do this than to wait until they reached the congested condition of the large cities, which, he thought, were, in many cases, past praying for. But, at the same time, small towns must not discourage the development of industry and healthy growth.

He would like to emphasise the need for strict control in the matter of advertising, which should not be allowed to disfigure their towns, as was often the case, and there should also be some measure of control over the architectural appearance for all buildings erected. In fact, he considered that this question should be brought to the attention of the Ministry and of Parliament, so that adequate powers could be given them to deal with it.

In too many cases in their smaller towns and villages the only place which was well laid out was the cemetery, and he would conclude by

From the Town-Planning Exhibit at Wembley.

Chesterfield (Highfield Hall Estate) Housing Scheme.

MR. VINCENT SMITH, Borough Surveyor, in consultation with MR. PERCY B. HOUFTON, Architect.

The Highfield Hall Estate, including park and hall grounds, comprising 104 acres, was purchased by the Chesterfield Corporation for development under the 1919 Assisted Housing Scheme. Since the curtailment of the Government scheme, let off in tenements, but will eventually be used as a public building. The park, of 23 acres, is being converted into a public recreation ground. The estate is now being developed by the Corporation, partly under the 1923 Act,

ng whether it was not time that something done to improve conditions for the living.
veral members took part in the subsequent ussion on these two papers. Mr. Swann irman, Housing and Town-Planning Com- tee, L.C.C.) said he thought one reason why were somewhat backward in town planning that public opinion was slow to form he South of England. In Greater London e was an area of about 9,000 acres of eveloped land, of which about 3,000 was able for development under a town-planning me. What was required was a comprehen- plan for the development of London as a le, which should also give them power to with built-up areas.
here was, in this connection, the problem of slums and overcrowded areas. What was to one with them and where was the necessary vision for those displaced by any scheme for areas to be made?
e considered the question of the reduction he density of population was almost entirely of finance; they had the difficulty of the boundary authorities who would not be , even if they were willing, to provide the ssary houses out of their own resources.
e thought the question of finance was one the Ministry to deal with, and felt the istry ought to take the lead in this matter, was one which they could not deal with out he rates.
here was also, he felt, a strong case for ing the cost of betterment on the owners.
eplying to questions raised during the ussion, Mr. Wiltshire said he regretted he omitted to mention that in Birmingham r city engineer was a member of the Art isory Committee; he thought it was most rable and necessary that the engineer and eyor should, in all cases, be a member of committees, as he was able to assist in the tical realisation of the schemes put forward.
With regard to cost of roads, the principle of eased contributions by large towns to assist heme had been adopted in the Birmingham— lverhampton arterial road.
With regard to the preservation of open ces, he thought much could be done by king use of narrow strips of land adjoining eams and brooks which could be linked up as to give a continuous chain of park-land.

Distribution.

The chair at this meeting was to have been en by Sir Aston Webb, but in his unavoid- e absence, Mr. Pepler (Chief Town-Plan- g Inspector, Ministry of Health) presided, in his opening remarks referred to the ere regret which they would all feel at reason for Sir Aston Webb's absence, their sincere hopes for his speedy recovery n the effects of his accident.
Dr. Raymond Unwin (Chief Architect of the istry of Health) then read an abstract of paper on "Distribution," which was illus- ed by lantern views. Dr. Unwin prefaced remarks by a definition of Distribution as ag the study of the general distribution of population and of industrial development, the distribution of different parts of any n or urban district. This aspect of town nning, he thought, required special study he present time; for it was the most essen- and difficult part of any scheme, and was, reover, the part in connection with which it most urgent to provide for further pro- ss.
On the one hand the realisation was being ed upon them that if they were to secure per development of urban areas, the con- of distribution as regarded population, in- try, open spaces, and, indeed, of all the erent parts of the town, must be carried ch further than had hitherto been at- pted. On the other hand, they had already n faced with the difficulty of carrying out n a moderate degree of distribution regula- without injustice to landowners, or in- ing heavy liabilities for compensation to se whose property might be depreciated in ual or prospective value. He thought the e had come when this difficulty must be faced frankly and removed effectively. It was becoming more and more evident that unless some adequate method of dealing with distribution could be found a great deal of what they called town planning, city improvements, and the solution of traffic problems would not be real remedies but merely palliatives.

Continuing, Dr. Unwin said that it should be realised that the difficulty did not arise because town planning was a costly enterprise, or that it was economically disadvantageous to the community that the various parts which went to make up the city should be allocated to those districts which were most adapted, by their location and circumstances, for each of the several functions which had to be provided for. On the contrary, all the evidence went to prove that there was a great advantage to the community in town planning and proper distribution, which was reflected in the value of the land to which these principles of development were applied. The difficulty, he thought, was due to the fact that many of the expectations of increment which had grown up under the system of private ownership of different pieces of land would be disappointed, while others would be exceeded if an orderly method of distribution, based on skilled foresight, was introduced.

Dr. Unwin then examined this question in some detail, and remarked that, with regard to values, owners of valuable residential land, commanding high prices because of its pleasant situation, might have that value greatly reduced if a neighbouring owner found that an immediate personal profit could be made by selling his site for a factory. An owner who had erected an expensive factory for manufacturing high-class confectionery might have his value practically destroyed by the erection in the immediate neighbourhood of a gasworks. The situation which had to be met was, he thought, that they had on the one hand the necessity for the adoption on a large scale of regulations as to the distribution of user with regard to land which would distribute in a new manner the increased values which attached to land for development purposes, and on the other a general demand for compensation in cases where such distribution regulations seemed to interfere with the owner's expectation in regard to the maintenance or improvement of value which might accrue, apart from such regulation.

The problem was one which depended a good deal on an attitude of mind which had grown up in the community, and which could only be changed slowly. This was one of the main reasons why legislation adopted successfully in one county could not be transferred, without modification, to another. Public improvements which were essential to the well-being of urban communities could not, at present, be effected because of the unwillingness to provide funds to compensate those injuriously affected unless these funds could, in one way or another, be obtained from those owners who were equally directly benefited by the improvements.

Turning to the consideration of the different methods by which the cost of distribution and town planning could be met, Dr. Unwin said that there were, broadly speaking, four ways of doing this: (1) By the public ownership of land; (2) the principle of special assessment, as adopted in America; and (3) the method known as excess condemnation, or (4) the taxation of land values. Each of these methods had its advantages and its weak points. With regard to the public ownership of land, it was obvious that if all land was held in one ownership the injuries and benefits would cancel out, and there would be a margin of increased value due to the improvements. The truth of this statement depended, however, on certain suppositions, which were not generally accepted. From the purely technical point of view of the town planner, there was no doubt the most satisfactory solution would be national ownership, but the difficulties of such a solution made it necessary to examine other methods.

The method of "special assessment," which was widely adopted in the United States, consisted, broadly, in raising a fund to compensate those whose land was taken or injuriously affected by assessing upon the land adjoining an improvement a special contribution or rate based upon an approximate estimate of the degree of benefit derived.

This method had been very successfully adopted by the town of Kansas, and it was found that the estate owners who had to pay this special rate had still benefited because of the increased value of their land due to the improvements.

The method known as "excess condemnation" was also widely practised in America, either as an alternative or in addition to special assessment. It had been adopted in London in the case of Kingsway, and consisted of purchasing compulsorily more land than was required for the improvement to be carried out, with the object of securing to the public the increased value consequent on the improvement. This method was, in practice, only applicable to certain kinds of improvements of limited area, and could not, therefore, be regarded as a complete solution of the problems arising from the redistribution of values which result from town planning.

The method of taxation of land values was unsatisfactory from the town planner's point of view because it would result in the creation of a common fund having no direct relation with the questions of distribution, etc., which would be just as difficult to get at as the rates.

With regard to the question of higher buildings, Dr. Unwin showed by two comparative plans of London and New York, that the "density area" was not reduced by the construction of high buildings in the central area of a city, because this necessitated wider and more numerous streets to deal with the increased traffic. He did not think there was any serious danger of such a development in London.

In conclusion, Dr. Unwin said that it must not be thought that because he had devoted considerable time and thought to the question of "distribution" that he had modified his views on the general principle of town planning. His aim remained the same, to secure for each citizen an adequate space in which to live or work and develop his faculties so that the race as a whole might become healthier and happier.

To do this the pernicious system of the growth of towns by mere inflation or accretion must be arrested. Open spaces must be secured and deliberately organised and planned; self-contained units must be planned to provide for the increase of industry and population, by the development of self-contained suburbs, satellite towns or garden cities, each defined by adequate open space, each planned in an orderly manner and all brought into proper relation to each other and the parent city from which they derived their impetus and to which they would continue to look for much of their prosperity and culture.

City Design.

Professor Adshead (Professor of Town Planning and Civic Design, London University) then read an abstract of his paper on "City Design," and, in the course of his address, said he thought the time had passed for writing about "tree-lined avenues," etc., and that what was now required was to consider the methods by which these could be obtained. He agreed with Dr. Unwin that the only means of arriving at a satisfactory result would be by a proper distribution of land values. With regard to the important matter of regional planning he considered that if regional plans were to be worth anything they must upset the actual land values. Unless this could be done the subsequent town plans would not be satisfactory.

Town planning was, in itself, only a stepping-stone to city design. He did not think the widening of streets in their big cities was a practical proposition, and for this reason he

thought there was no real danger of higher buildings in such a city as London; in fact, he thought enlightened opinion was tending more and more against such a proposal. Speaking as an architect to a meeting composed mainly of those who were not architects, he would say that he did not think architects as a whole looked at these questions as broadly as did town planners: they did not give sufficient study to town planning and sociology. At the present time he felt they were passing through a transitional period consequent on the passing of the big landowners, who (with all their faults) had larger views and planned on big lines. He considered the future held much promise and that the solution of the problem of distribution would be as favourable to fine architecture as to good town planning.

The discussion on these two papers was opened by MR. LANCASHIRE (City Engineer, Leeds), who said he thought American methods, however successful in the United States, would not, in most cases, be applicable in an old country such as our own, and hoped for a solution for the problem of distribution on traditional lines. Continuing, Mr. Lancashire gave some particulars with regard to the difficulties of architectural control of new buildings in Leeds, and said he thought this was essentially a question of to-day.

ALDERMAN ROGERSON (Worsley) referred to the difficulty of providing open spaces on built-up land between a large city and its smaller neighbours, and suggested that in such cases some sharing of the cost was the only solution, even when the area in question was outside the municipal boundary of the large city. With regard to housing, he thought the fault of the Addison scheme was that insufficient discretion was given to local authorities.

SIR THEODORE CHAMBERS spoke on the question of values, and said the difficulty was that any modification of values consequent on distribution and town planning meant that the ratio of supply and demand was completely modified in the area affected. There would be endless arbitration in any attempt to settle the questions of betterment and loss, though he agreed that, as a rule, most town-planning schemes increased the ultimate, though not always the immediate, value of land; this problem was just as difficult in a small town as in a large city.

In their larger cities the demand was, at present, concentrated too much on the central area; what was required was to bring the owners and commercial men to see that they would gain by going farther out. This idea, he thought, was gradually gaining ground, because the tendency in any questions with regard to rates of wages was to consider these in connection with the "cost of living," which included all that made life expensive to those who had to work in congested areas—rates, transport, and loss of time had all to be considered in their relation to wages and costs. With regard to the solution of this problem by means of satellite towns, he thought the chief difficulties were the cost of construction to the small local authorities and the loss on the rateable value to the larger towns by the emigration outside their municipal area. The problem was, how could the larger towns, if they had to bear a considerable amount of the cost of construction, also share the benefit which would arise from the increase in rateable value due to the development of such satellite towns?

COUNCILLOR BOWRON (Rochford) discussed the question of the control in the erection of temporary buildings which were not in accordance with by-laws, and said he thought the solution of this and many other problems was to be found in the American's definition of liberty: "Let every man do as he likes, and, if he won't, make him!"

COUNCILLOR BERKELEY (Kidderminster) referred to the special difficulties of small industrial towns where recurring periods of industrial activity and depression resulted in bad housing and planning. He also mentioned that industrial populations did not always appreciate good conditions unless accompanied by transport facilities.

MR. REGINALD BRUCE (Chief Surveyor, Manchester District Joint Town Planning Committee) mentioned that in the area round Manchester they had, in effect, a series of satellite towns, but (owing to the high value of the intermediate land) it was a matter of great difficulty to provide adequate open spaces at a reasonable cost.

COUNCILLOR HILES (Cardiff) said he thought one of the chief needs of the present time was to convert the non-technical members of municipal bodies and to emphasise the necessity of taking long views. In Cardiff they had one of the finest examples of town planning in the country, but when this was undertaken there was a great deal of opposition on the part of the public. He thought they should not be afraid of what the man in the street said to-day, but make their schemes for the future.

DR. UNWIN, in his reply, paid a tribute to the work of Mr. Pepler at the Ministry of Health, and said that he entirely agreed with Mr. Lancashire as to the need of solving their problems on traditional lines. With regard to the difficulty of providing the necessary open spaces between towns where the value of the land was considerable, he suggested this might be met by acquiring more land than was actually required for the improvement, and selling the surrounding property, when the increased value would probably considerably decrease the ultimate cost of the improvement. He entirely agreed with Sir Theodore Chambers in his remarks on the subject of values, and suggested that if the parent city acquired the satellite towns there might be advantages as well as liabilities.

PROFESSOR ADSHEAD, in his reply, stressed the need of obtaining public support for regional planning, and also referred to the urgent need for architectural control of buildings on arterial roads where these approached towns and cities.

The chair at the afternoon session was taken by Sir Henry Maybury, K.C.M.G., C.B. (Director of Roads, Ministry of Transport), when papers were read by Mr. J. A. Brodie, P.P.C.E. (City Engineer, Liverpool), on "Planning Main Roads," and by Mr. T. Alwyn Lloyd, F.R.I.B.A., on the "Planning of Estate Roads," which terminated the business meetings of the Conference.

THE DINNER.

MR. NEVILLE CHAMBERLAIN was the guest of honour at the tenth anniversary dinner of the Town-Planning Institute at the Savoy Hotel on May 7. MR. W. T. LANCASHIRE, the senior Vice-President, was in the chair. Amongst a distinguished gathering of members and guests were Mrs. Chamberlain, the Dean of Windsor and the Hon. Mrs. Baillie, Mr. and Mrs. J. A. Brodie, the High Commissioner for Australia and Lady Cook, Mr. Carby Hall (Chairman, North of England Division) and Mrs. Hall, Mr. E. Howard (President, International Garden Cities and Town-Planning Federation), Sir Henry Maybury, Sir Richard Redmayne (President, Institute of Professional Civil Servants) and Lady Redmayne, Sir Arthur and Lady Robinson, the Lord Mayor and Lady Mayoress of Birmingham (Alderman and Mrs. T. O. Williams), the Town Clerk of Birmingham and Mrs. F. H. C. Wiltshire, Professor and Mrs. Abercrombie, Professor and Mrs. Adshead, Mr. and Mrs. E. G. Allen, Mr. R. Bruce, Mr. and Mrs. W. R. Davidge, Mr. M. J. Dawson, Mr. F. M. Elgood, Mr. P. M. Heath (Town Clerk of Manchester), Lieut.-Colonel H. Carte de Lafontaine, Mr. and Mrs. H. V. Lanchester, Mr. T. Alwyn Lloyd, Mr. and Mrs. R. A. Reay-Nadin, Sir Richard Paget, Mr. Barry Parker, Mr. and Mrs. G. L. Pepler, Mr. and Mrs. H. E. Stilgoe, Mr. and Mrs. F. L. Thompson, Alderman Thomas Turnbull, Dr. Raymond Unwin, and Mr. A. R. Potter (Secretary).

After the loyal toasts had been honoured, the Chairman, proposing the toast of Mr. Chamberlain, said they were a young institution, and their early days were somewhat troubled; like all reformers and enthusiasts, they were subjected to ridicule. They were designated cranks and visionaries, but their reputation sanity was now established.

Mr. Chamberlain responding, said it was in t month of May, 1913, that the first town-planni scheme under the 1909 Act opened its campaig and as chairman he saw the first scheme carri through by the Corporation of Birmingham.

When one reflected on the way in which t country had grown up, and looked at the co glomeration of their great cities, and what mig have been if town planning had existed 2 years ago, one asked the question: Why h they not thought of it before? Some peo went so far as to assert that town-planni came too late to save the country, but he d not consider this the case. Gross as had be the mistakes of the past, they were not whol irretrievable at the moment. A great part the problem concerned the replanning of t areas that had already been built up. Region town planning had now become recognised one of the higher branches of the art, and had made such remarkable progress that would not be unreasonable to say that they cou already measure the time in which the whc country would be covered and come under co trol of one kind or another.

The next great step in town planning wou be additional legislation which would give local authorities power to replan existi cities, and which would deal with importa features, namely, the control of the main li of communication, and the location, or zonin which meant the future method of using sit within the area. It would be necessary proceed with the utmost caution and wisdo It sometimes occurred to him whether it wou not be wise to try experiments by means private Acts, passed by progressive bodies wh had technical resources. Possibly an expe ment of that kind, preceding general Acts, mig be the best method. It was the greate mistake to suppose because a city had been existence for hundreds of years it was, therefo in a state of stable equilibrium.

In the great problem of housing, which w agitating the country, the question of t future of the slums was one which continual pressed upon them, and was more insistent th any other, because of its effect upon the conten ment, happiness, and health of the peop He had given a good deal of attention to t subject, and in his opinion the whole questi of the future of the slums was inseparable fro the idea of town planning. In the past they h had to proceed, when dealing with small are without any general idea of where they we going. The question of slum improveme was not merely one of substituting good buil ings for bad, but it was actually a question the redistribution of part of the population.

They could not make a disturbance in t existing distribution without raising a wh lot of problems to which, in the absence of plan, there was no answer. They had to ma up their minds where the people were to li where the factories and commercial and pub buildings should be. Then the whole proble raised of the sweeping away of the slum wo receive an answer. One of the great functi the Town-Planning Institute was performi was the education of public opinion. Nothi was more important. There was no section public opinion which was more in need education than those who were concerned w the local authorities. It was a subject wh appealed highly to the imagination, but it w one which required faith and knowledge appreciate its full responsibilities.

THE DEAN OF WINDSOR, proposing "H Majesty's Ministers," said Cabinet Minist came and went, but he thought that Engla was managed very largely by herself rather th by her Ministers. Ministers should be ve sympathetic with the work that had gone on improving the country. Irrespective of politi he believed the present Government maintain a universal standard of desire for the welfare the country—the finest praise they could gi to any Government.

In the absence of the Minister of Transpc

H. Gosling), Sir Henry Mayury responded. Government departments, represented by Civil Servants, were, he said, in sympathy the work of local authorities. The great s of town planning and arterial roads were much allied.

r Richard Redmayne (Chief Inspector of s), proposing "The Town Planning Insti- " said their colliery villages were an re to the Kingdom, and more in need anything else of the reforming in- ces of the town planner. The appalling itions had led to an appeal to the town ner, and in this way perhaps they per- ed a useful function. He only wished that forefathers 200 years ago, at the commence- of the era of great industrialism, had had benefit of the Town-Planning Institute. would not then have witnessed such a rable thing as the five towns of North ordshire; and Wigan and Swansea.

r. William Carby Hall, responding, said were celebrating that night their tenth anni- ry, and there might be many of them who happy memories of their inaugural dinner the toast of the evening was given by the t Hon. John Burns, who was the President e Local Government Board and responsible he passing of the first Town-Planning Act. onclusion, as Chairman of the Northern ch, he suggested that a branch should be ed to enable members who lived far from quarters, to meet together with greater ty and therefore further the interests of the itute, in which were to be found the bonds ood fellowship and sincerity which enabled to do work for the benefit of their fellow-

THE EXHIBITION.

he exhibition at the British Empire Ex- tion, organised by the Institute and timed coincide with the Annual Conference of body is excellent in many respects, and illustrates the rapid growth of town ning in this country and in the various s of the Empire. In the foreword to the logue of the exhibition the purpose of n planning is defined as being the most ductive use of all land in the interests of community as a whole, and it is pointed that to achieve this it is clear that the rest of the community must be repre- ed by a responsible body, which respon- lity by Acts of Parliament has been placed he shoulders of local authorities, under the ervision of the Ministry of Health, who now guide the development of their terri- s and allocate to each part the function which it is best suited, and at the same make provision for inter-communication hat the whole may represent a balanced efficient organism. It is also pointed out the main object of town planning (and regional planning might well have been ded) is not the carrying out of expensive ks by local authorities, but the orderly ning of all development so that whatever ey is subsequently spent, either public or ate, shall be put to its most productive and not wasted on mutually destructive or fective objects as has so often been the in the past.

he exhibition is divided into nine sections: Civic Survey; (2) "Zoning"; (3) Town- ning Schemes; (4) City Development s; (5) Regional Town Planning; (6) len Cities; (6a) Garden Suburbs and sing Schemes; (7) Open Spaces; (8) ds, from which it will be seen that the bition is so planned as to give the general ic a sort of general survey or bird's-eye of the whole subject of the orderly plan- of national resources, whether human, strial, or historical, or, as is usually the , a compound of all three.

pace does not permit any detailed refer- to exhibits, and, moreover, these could be made easily intelligible in most cases out reproductions in colour of the maps, rams, and plans which go to make up It is certainly the most comprehensive bition of this vast subject which has yet arranged, although, in point of size, the necessary limitations of space have had their effect. This is not altogether a misfortune as it has resulted in a judicious selection being made of exhibits which are of considerable interest not only to the technical expert but to the ordinary man in the street, who (with the help of the explanatory notes which are given in the catalogue) should be able to form a very good idea of the methods by which the problems of our urban and industrial life are being solved.

THE NATIONAL HOUSING PROGRAMME.

An important conference of Trade Union and Co-operative Associations took place at the British Empire Exhibition last Saturday on the subject of the minimum standards of design and the lay-out of land in the housing schemes of local authorities.

This meeting was organised by the National Housing and Town-Planning Council, and was attended by a large number of delegates from all parts of the country, together with representatives of the Council, the Town-Planning Institute, and various local authorities.

The proceedings were opened by a brief address by the chairman, Mr. A. G. Cameron (Secretary, Amalgamated Society of Woodworkers), who said the object of their meeting was to discuss the following resolution. If approved by this conference, this resolution would be addressed to the Minister of Health. Mr. Cameron, after a reference to the work of the National Housing and Town-Planning Association and the need for propaganda work, said that it was a remarkable fact that those who were worst housed in the community were also those who took the least interest in the question of better housing. He attributed this lack of interest to the depressing and deadening effect of the conditions under which these people now lived. What was essential in building was that there should be quality as well as quantity; there was nothing which impressed the mind so much as fine architecture, and he thought that when they visited a fine, well-planned city, it compelled respect for the inhabitants of that city. Therefore, he was convinced that good housing would result in an improvement in the character of those who lived in such conditions.

In the discussion on the resolution which followed it became clear that the resolution would be unanimously carried on condition that it represented the irreducible minimum as applied to the new programme now under consideration by the Minister. Tributes were paid by many delegates to the zeal and ability of the architects who had designed and supervised schemes in various parts of the country, and the view expressed that if more discretion in the details of houses and accommodation was allowed to local authorities their architects would be able to give them what they wanted. Delegates from Northern districts, which were well represented, were insistent for rooms of greater height than 8 ft., especially on the ground floor. The view that private enterprise "cannot and will not build houses except for sale" was generally endorsed, and the necessity (in future schemes) for providing not only a bath, but a bathroom, and a properly constructed and ventilated larder were strongly urged. There was also expressed the view that in all future housing schemes the minimum accommodation should be three bedrooms, all of which should be of reasonable size, and that the floor area might well be increased to 1,000 square feet.

On the question of finance, it was generally held that an increased contribution was necessary or, if this were not possible, that the financial basis of the new scheme should be national and not local. The suggestion was made by Mr. Lanchester for a sliding scale subsidy with the maximum amount for 1,000 ft. floor surface with reduction for each house of less area. The view was also expressed that a large proportion of the high cost of building was due to the abnormally high rate of interest charged on loans, and reference was made to the difficulty of obtaining sites in urban areas.

The proceedings terminated by a unanimous vote for the following resolution as a minimum for any new housing programme:

1. The houses should be broad, rather than deep, in order to secure that all the rooms shall have ample light. This will involve the giving of increased frontages, but the additional cost can be met by economy in road construction under modern town-planning conditions.

2. Back extensions are better avoided, and all the rooms should be brought under the main roof. In the old type of workman's cottage the room most used is generally the most gloomy. The kitchen-living room is the workroom of the wife, and should be the sunniest and most pleasant room in the house.

3. Three bedrooms should be provided in all the new houses. There are hundreds of thousands of two-bedroom cottages in existence, and the members of the Committee therefore took the view that the cottages now to be built should be of the three-bedroom type.

4. The houses should, as a rule, be provided with parlours; the working people of this country know what they want in this respect, and the great majority desire the parlour cottage. Wherever possible this desire should be met, whilst securing at the same time that the kitchen-living room shall be of ample size and the sunniest and most cheerful room in the house.

5. Each house should have a bath, with provision for hot water supply, either in a separate bathroom or in the scullery.

6. Ample window space should be given, and the windows should be carried as near to the ceiling as possible.

7. Where the by-laws do not already demand it, an impervious layer of concrete, or other approved impervious material, should be laid under all floors to prevent damp rising, and the proper damp-proof course should be provided for all walls.

8. The level of the ground floor of the house should be above the level of the ground immediately surrounding it. The members of the Committee suggested that in the case of all housing schemes for which subsidies are granted the Government should insist that the necessary safeguards described in 7 and 8 be adopted where the by-laws or methods in operation do not already require them.

9. The assistance of women with close knowledge of household economy should be sought in regard to detail of interior construction.

The Lay-out of Urban Housing Schemes.

(*a*) That the number of houses per acre in urban housing schemes should not exceed twelve.

(*b*) That attention should be given to the planning of arterial roads, so that future expenditure on road-widening may be avoided.

(*c*) That on condition that the preparation of a town-planning scheme is entered upon within a reasonable period local authorities should be permitted to relax, for the purposes of these housing schemes, their by-laws and customary provisions relative to the width and construction of streets in residential areas.

(*d*) That building lines should be fixed to secure the proper set-back of cottages.

Rural Planning.

1. That there should be in every case a proper lay-out scheme submitted.

2. That where a scheme is large enough to justify it, an open space should be provided.

3. That the provision of land for cottages should, as a rule, be not less than one-eighth of an acre per cottage.

4. That even where only a few cottages are built care should be taken in their grouping, and especially in the set-back from the main roads, which should be ample in view of possible future requirements.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript?—Ed.

Cost of Building.

Sir,—Could you please give me a comparison of the cost of building work at August, 1914, April, 1921, and April, 1924.

The percentage of rise or fall based on the prices ruling at present would meet my requirements.

"Furness."

[We would refer our correspondent to the comparison of pre-war and present-day prices published in the first issue of *The Builder* in each month.—Ed.]

Glasgow Building Materials.

[Reply to J. J. H.]

Sir,—(*a*) For external walling, cube sand stone is generally employed for public buildings of an important nature, but ashlar with dressings is also largely used for less important jobs. Domestic houses before the war generally had rubble stone exterior walls in the suburbs of Glasgow, but now a common brick and roughcast is more usual on account of economy.

(*b*) Internal walls in brick or concrete blocks.

(*c*) Facing bricks are sometimes employed, chiefly of the "Bothwell Park" variety. Imported sand-faced bricks are not likely to stand well the moist climate, besides losing much of their value when used with local slate roofs.

(*d*) Prices rule much as in London.

Terra-Cotta Building Blocks.

Sir,—The difficulty of obtaining bricks in the Home Counties has given me the inclination to make use of one of the good makes of hollow terra-cotta building blocks now on the market.

If any of your readers have had experience of the use of this material can they tell me:—

(*a*) Are these blocks suitable for weight-bearing walls?

(*b*) Does the average country builder "set his stall out" to make the best use of this material?

(*c*) Is there any difficulty in cutting for bond, or have special blocks to be made to suit the sizes of an existing plan?

(*d*) Is this form of construction an economy, or how does it compare with ordinary brick building?

"Conservative."

"Domestic Hot-water Supply."

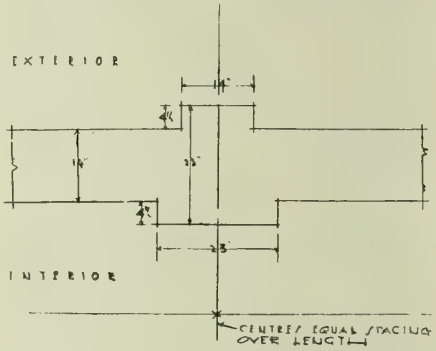
[Reply to Architect.]

Sir,—*Re* the above in last week's *Builder*, I have recently had a similar case, and found a cure through altering the space at back of the boiler by inserting a fireclay tile between the back of the boiler and brick face at back, reducing the space from 4½ in. to 2½ in.; the heating was raised so that three or four hot baths could be taken immediately following each other. Your querist does not give all details. My case had 25 gallon tank in bathroom, three radiators for heating rooms, 14 in. flow and return 1oot boiler in a pre-war 45 in. range. I find it a common thing for builders to give too much space behind the boiler, so the fire roars to waste and the heat does not properly affect the boiler.

"Experto."

Sir,—If "Architect" is correct in assuming that the trouble is due to an over-large cylinder he can easily save himself the trouble and expense of changing the cylinder for a smaller one.

All that is needed is to disconnect the return pipe, plug the connection, and re-connect the return pipe higher up in the side of the cylinder. This in effect reduces the hot-water capacity of the cylinder, the bulk of the water below the new return connection not entering into circulation. This is a comparatively simple operation.



"Plumbing."

Gables to Pantiled Roof.

Referring to our correspondent's query in our issue of the 25th ult., Messrs. John Williams & Co. inform us it is not possible to obtain right and left-hand pantiles unless they are made specially to order. They state, however, they have on the market a special improved pattern pantile which can be fixed to avoid the one-sided appearance of which our correspondent complains.

Cavity Between Brick and Concrete.

Sir,—I recently executed designs for a building. The main hall, which is to be used for dancing, concerts, &c., is 96 ft. long by 57 ft. wide, and is divided into eight equal sized bays. The main walls to this are 14 in. thick, increasing to 23 in. thick where the roof trusses are carried (see sketch attached). All main walls have footings stepping out in the usual manner to twice their thickness, and with 12 in. thick reinforced concrete in foundations. The height of these main walls from bottom of footings to eaves is 27 ft. It is now proposed to substitute concrete for brickwork, except that a 4½ in. brick "shell" is to be introduced in order to

give the appearance of solid brick from the exterior.

Can you inform me, please, if you consider it practicable and whether it would be the more satisfactory to build solid or to introduce, say, a 2 in. cavity between the brick and the concrete, the two materials being tied in the usual manner with metal ties or through blocks? It is the intention of the people concerned to have reinforced concrete foundations only.

If you are not in a position to answer these queries, I shall be glad of information as to the business designation of firm or individual capable of supplying the necessary information.

F. W. Holloway.

Stains on Cement.

[Reply to A. Watson.]

Sir,—The stains referred to by your correspondent should be treated according to their cause and nature. If they are the result of dripping and running down the surface in certain places, as at the sides of an undrained flat or the ends of an unthroated projection, the cause should first be removed and the dripping water diverted. If the cement surface is thoroughly sound and the stain thus only superficial it can then be rubbed off with a hard stone, and the surface will quickly weather to a uniform tone. The stains may, however, be due to the imperfect mixture of the compo. in the first instance, giving some areas more than their correct share of sand, and so leading to porous patches which hold the damp. If this is the case, such areas will need cutting out and replacing with the correct mixture, and it is difficult to see how a patchy appearance can be avoided without colouring or painting.

"A.B.C."

Adhesion of Tiles.

[Reply to J. W. Watson.]

Sir,—It would seem probable that Mr. Wat- is correct in attributing the trouble to the de of the reinforcement joists. It is always better practice to have the latter comple bedded in the floor concrete, both top bottom. If any of the loose tiles have l taken up and found to have much of the orig mortar-bed adhering thereto this would con the matter, showing that the displacement due to the non-adhesion of the bedding to solid floor. If, on the contrary, the tiles th selves are coming away clean from the l leaving the latter perfect, the fault is proba in the tiles not having a sufficiently "keye under surface.

The adhesion of mortar to a surface depe to a large extent on the drawing into the la of liquid grout, which, on setting, becomes th oughly incorporated therewith. This proc if allowed to excess, of course defeats its o object by drawing away all the water from wet mortar and arresting a chemical acti hence the wetting of bricks before laying a the drenching of walls before plastering; l in the case of an iron surface it cannot oc at all and the mortar merely lays on the after it has set and will almost inevita crumble when constantly jarred by traf It is probable that this is the case in this instan

The remedy would be probably again to scr over the entire surface after clearing away old mortar. The new screeding would need be of an extra thickness (2 ins. or over), a the tiles relaid thereon. The bed would th have a certain strength of its own that sho stand ordinary traffic. If very heavy tra is to be anticipated a layer of wire netti bedded in the mortar would greatly assist.

"A. B."

EXHIBITION NOTES

OLD WATER COLOURS.

The water colour drawings now at Mess Agnew's Gallery form the annual exhibiti on behalf of the Artists' General Benevole Institution. The artists are Turner, Cox a de Wint. Of special interest as to t Turner drawings is that they are arranged groups as far as possible chronologica from before 1810 to 1843. It is interest to note the care and precision and genc air of accuracy in "Salisbury Cathedral La Chapel" (1797) with its agreeable tones yellow and brown. Here is a drawing object of which appears to be to empha the architectural quality of the subj which it does to a considerable degree. H different it is to the long array of myst landscapes which Turner afterwards indul in, painted mainly in reds and blues, a which left definite forms and substance of reckoning. The Cox drawings are in main disappointing, and when he essa architecture, as in his "Whitehall" (79), result was quite hopeless. In direct br treatment with good colour de Wint ov shadows his fellow exhibitor; there several of his most admirable drawings h These three artists, Turner, Cox and de W were born and died within a short time of e other, but the tradition of beautiful wat colour art which they each in their own v carried on has not been forgotten, and Wint has more specially seemed to h inspired some of the best work of to-d Three are 138 exhibits in this collection Messrs. Agnew's.

The Society of Architects.

The Scholarship for the Study of Mod Architecture Abroad, which was instituted the Society of Architects last year, but winner of which was unable to proceed, will awarded this year for what is, therefore, virtu the first time. Candidates must make appli tion before May 27. Entries for the Vict Scholarship are invited by the Society at same time.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

Building Trade Workers.

Replying to Mr. Black, who asked whether, view of the urgent need for houses, he would ss the various building trade-unions to permit employed ex-service men and other unemyed men to be employed in the various trades the risk of the building employers, Mr. Shaw nister of Labour) said that the subject of the mentation of the number of building trade rkers was under consideration in connection h the report recently prepared by the ployers' and workers' organisations. In s connection, the Minister of Health and would take into consideration any practicable thod of absorbing men at present unemployed. Dr. Macnamara: Will the right hon. gentlen consult with his colleague as to the desirlity of reviving the proposal to train fit exvice men? Mr. Shaw: I will consider with right hon. friend any practical proposal increasing the workers in the building trade, agreement with the employers' and workers' ganisations.

Wood, Concrete, or Brick?

Mr. Lumley asked the Minister whether he d inspected types of working-class houses ilt of wood and concrete; if so, how many ferent types had he inspected, and of how ny he approved.

Mr. Wheatley said that for the purposes the 1919 housing scheme, large numbers of cial methods of construction in wood or ncrete were examined and approved. Houses re erected in accordance with about fifty such thods.

Mr. Becker: Is the right hon. gentleman's partment in favour of building wooden houses the American plan, if they be cheaper than ck houses? Mr. D. G. Somerville: Is the ht hon. gentleman aware that none of these er forms of construction are anything like satisfactory as brick? Mr. Wheatley: think there are many criticisms, and some ople even criticise brick!

Mr. Greenwood informed Mr. T. Thomson at the Minister of Health had some correndence with reference to an offer in general ms to build concrete houses on an American nciple at £250 each. He had informed the nufacturers concerned that he would concur i any proposals which local authorities might bmit for erecting a small number of houses l the method proposed, subject, of course, to scheme submitted conforming with the neral requirements of the Ministry, and to houses being erected and completed at a sonable cost.

Replying to supplementary questions, Mr. eenwood said that in the two housing schemes at had been adopted concrete houses had been lt, and were continuing to be built. He d said nothing which would lead hon. members believe that the Ministry already regarded s method as a satisfactory one. The whole rpose of erecting a small number of houses s to enable them to get experience as to the visability of this method.

House Building Costs.

Mr. Greenwood (Parliamentary Secretary to Ministry of Health) informed Sir K. Wood at there had been no material advances in costs of building since January. The total reases in the cost of construction warranted such general advances as there had been uld not exceed £5 10s. a house.

Price of Sheet Lead.

In reply to Mr. R. Morrison, Mr. Wheatley d he was aware that the price of sheet lead d risen approximately from £36 a ton in ril, 1923, to £48 a ton in March last. It had, wever, quite recently been reduced in price about £4 per ton. He was advised that increase in cost of sheet lead had been due to a corresponding increase in the cost of the raw material which, in turn, was governed by conditions of world-wide demand.

Working-Class Houses.

Mr. Wheatley informed Mr. E. D. Simon that it was not possible to state the total number of working-class houses completed by all agencies in 1921, 1922 and 1923, as figures were not available showing the number of houses erected by private enterprise without State assistance over the whole period. The numbers of houses erected with State assistance were: 1921, 86,669; 1922, 88,999; and 1923, 19,185. During the year ended September 30, 1923, it was estimated that over 39,000 houses of not more than £26 rateable value in the provinces and £35 in the Metropolitan Police District were completed.

Red Facing Bricks.

Mr. Wheatley informed Mr. D. G. Somerville that red facing bricks were not in general use for cottage building, and the Committee on Building Prices had not, therefore, obtained records of the price of this class of brick.

Prices and Wages.

Mr. Wheatley informed Mr. E. D. Simon that the average increase in the present prices of the materials used in building workmen's houses over the prices ruling at the end of 1913 was estimated to be about 85 per cent.

Direct Purchases of Material.

Mr. Wheatley informed Mr. Laverack that as at present proposed it was not the intention of the Government to make direct purchases of material in connection with the new housing scheme.

Unemployed Brick-Workers.

Mr. Shaw informed Mr. White that the number of insured contributors under the Unemployment Insurance Acts who were registered as unemployed in the brick, pipe, tile and fire-clay goods industry in Great Britain on March 24, was 4,134, as compared with 4,876 on February 25, 1924.

Land Valuation Office.

Mr. W. Graham, Financial Secretary to the Treasury, informed Sir L. Lyle that the cost of the Land Valuation Office for the years 1920–21 to 1923–24 was as follows:—1920–21, £541,964; 1921–22, £503,075; 1922–23, £388,515; 1923–24 (approx.), £359,000.

Mr. D. G. Somerville: Is it not a fact that, in spite of the enormous sums spent on the valuations, only one-tenth of the valuations of the country were ever made? Sir L. Lyle: In view of this brilliant example of how not to do things, will the Government immediately drop any idea of continuing this Department? The Speaker: Those are matters for debate.

Replying to a further question from Sir L. Lyle, Mr. Graham said that the net receipt from all Land Value Duties from their inception to March 31, 1924, amounted to £6,151,008.

Distressed Tenants Bill.

Mr. Clynes informed Captain W. Benn that the Government could not see their way to give facilities for the Distressed Tenants Bill. The Government made proposals for the protection of unemployed tenants which a majority of the House refused to accept.

Cost of Government Housing Scheme.

Mr. Greenwood informed Sir K. Wood that the Minister of Health was not yet in a position to say what extra cost, if any, would be incurred under the proposed housing scheme in this financial year. The hon. member must know quite well that negotiations were now proceeding with the local authorities, and that the Bill had to be produced and passed through this House before any estimate could be made.

Mr. J. F. Hope: Are we to understand from the reply that the Bill would be passed first and the estimate of the cost arrived at afterwards?

Mr. Greenwood: We cannot tell until the Bill has been introduced and passed through all its stages what the actual cost will be.

Stone Work on National Buildings.

Sir John Brunner asked the First Commissioner of Works whether, in view of the large amount of money which was annually expended on repairing the stone work of national buildings, he was carrying out any research work to find a suitable preservative material.

Mr. Jowett said the department of Scientific and Industrial Research had appointed a committee, with a research staff, to investigate the whole problem of stone decay and the possibility of its prevention.

Industrial Training.

Miss M. Bondfield (Parliamentary Secretary to the Ministry of Labour), informed Lt.-Col. Horlick that during the years 1919 to 1922 (inclusive) 2,054 disabled ex-service men completed training under the Industrial Training Schemes as bricklayers or plasterers. None were trained as slaters. The approximate cost was £450,000, of which about £350,000 represented allowances to the men. Out of a total number of 2,635 men who had received training as bricklayers or plasterers under the scheme, 142 were registered as unemployed at the end of March, 1924. Apart from the above figures, over 600 men were trained in the trades mentioned under the Interrupted Apprenticeship Scheme.

White Lead Convention.

Mr. R. J. Davies (Under Secretary to the Home Office), informed Sir P. Lloyd-Greame that the Government had introduced the Lead Paint Bill with the express purpose of giving effect to the provisions of the draft Convention and if Parliament accepted the Bill and passed it without any amendments inconsistent with the Convention, it was proposed to ratify the Convention.

NOTTINGHAM EXCHANGE.

The President (Mr. E. H. Heazell), Vice-President (Mr. W. R. Gleave), and Hon. Secretary (Mr. H. H. Goodall), of the Nottingham and Derby Architectural Society, wrote recently to the *Nottingham Guardian* as follows:—

"The local Architects' Society has been reproved by some persons for venturing to put forward their view that the best building on the Exchange site would most likely be obtained by means of an open architectural competition.

"We trust you will allow us to state our reasons for this opinion. If it seems rather late, our excuse is that we only held our full meeting, since the scheme was made public, two days ago.

"(1) The outstanding importance of the site demands that concentration of thought and consideration of the problem from various points of view that a competition brings about. Incidentally the promoters have to make up their minds, with skilled help, what is essential and what optional.

"(2) The keeping of such a gigantic building scheme like this within the narrow limits of a Corporation department (even with competent architectural assistance) is a departure from the example set by municipal bodies like the L.C.C., Birmingham, Cardiff, Glasgow, Leeds, and Newcastle, to name only a few. Great commercial concerns like the Mersey Dock and Harbour Board and the Port of London promoted competitions, as did the University of Wales in another sphere.

"(3) It is only half a truth to say that a competition takes the decision out of the hands of the promoters. We maintain that an assessor is a real help in securing what the promoters require. Few City Councillors are equipped to form a judgment as to the merits of such a scheme.

"(4) It is not presumptuous of a local body of architects to criticise the action of the Corporation and to express their views thereon. As citizens we only ask that a recognised method of obtaining the very best shall be adopted."

THE BUILDING TRADE

THE HOUSING PROBLEM

PROPOSALS OF THE LONDON MASTER BUILDERS' ASSOCIATION.

WE have received from the London Master Builders' Association the following scheme for the relief of the housing shortage :—

Preliminary.

Recognising that the Bills passed by successive Governments have more or less failed to relieve the serious position due to the shortage of houses, and that the building industry should accept the responsibility which devolves upon it, the London Master Builders' Association have given earnest consideration to the subject, and now desire to submit the following proposals, believing that, if adopted, they would meet very largely the expressed intentions of H.M. Government to provide annually the largest possible number of houses.

It will be at once understood, in view of H.M. Government having appointed a special Committee of Employers and Operatives to report on the availability and supply of essential building labour and materials for their scheme, that this phase has not been under consideration, and it would be left to this Committee to determine entirely the question of construction, as well as the supplies of materials at fair costs. For the purposes of the scheme it becomes, however, necessary to assume that the Government would be able definitely to arrange a programme, extending over a period of years, and this, it is suggested, should be a minimum of 500,000 houses and the time 10 years.

In their Housing Bill it would be anticipated that the Government would take special powers to deal with the question of securing sufficient land for the purposes of the scheme, and that suitable houses would be erected, including the expenses of land, roads, sewers, water supplies, and artificial lighting, &c., at an inclusive cost of £650 each.

It would also be anticipated that the Government would take the necessary authority to give a Government guarantee for the payment of interest on the loan for the building of these houses raised by the various Regional Associations of Building Trade Employers throughout the United Kingdom, or as otherwise arranged. It is suggested under this scheme that, for the purpose of securing the loan required at the lowest possible rate of interest, the Government should consider making it free of any taxation (*i.e.*, death duties, income tax, and super tax) present or future.

In order to set off any loss to the participants of this scheme in purchasing houses under its provisions, H.M. Government would be asked to grant a subsidy to all purchasers of £100 for each house. Every encouragement should be given to members of the working classes, of known good character, to acquire their houses, which, it will be observed, less the subsidy, would cost £550 each.

All purchasers would be required to pay something down—in cash, if possible—as a guarantee of their *bona fide*. It is suggested that difficulty might be experienced in this matter, and that £10 or £20 might prove too great a sum for intending buyers to pay, and provision has been made in our scheme accordingly. However, it has to be remembered that in pre-war days builders of speculative properties did not find serious difficulty in obtaining a minimum of £20. As well, it might be possible to arrange through the various employers of the country a "tontine" system in connection with the factory or shop, so that subscribers could make weekly subscriptions, and when an amount of £50 had been subscribed by the members take a ballot and the successful member (having, of course, to continue his payments until the £50 had been paid in) would have the advantage of getting his house first. In view of the great success which was achieved by the sale of National War Savings Certificates on somewhat similar lines, there is every indication that this would also be successful.

Having arranged for payment of £50, either as in our formal proposals or as in the foregoing paragraph, the purchaser would then take up a mortgage on the house for £500, which would require to be repaid in 50 years (or whatever the finally agreed term might be) as to principal and interest.

Annexed will be found schedules* dealing with the repayment of principal and interest at varying percentages, and at varying terms; but for the illustration of the working of the scheme the basis of 50 years has been taken with an interest on loan of 2½ per cent. For the redemption of the loan in the period £10 per annum would require to be repaid by the purchaser, and if the interest were paid off year by year on the outstanding balances the amount required for interest would be reduced by 5s. each year. Thus the payments would begin at the rate of 8s. 8d. per week, and gradually diminish until the completion of the repayment at the end of 50 years.

As an alternative to the scheme of repayment it may prove of advantage *to* "spread over" the total amount of interest payable for the full duration of the loan, so that the repayments of principal and interest would remain the same right through the life of the mortgage instead of gradually diminishing as in the former. Purchasers would, of course, have to maintain their property, and be responsible for the execution of repairs.

It is fully realised that in a scheme of this nature—particularly owing to the long duration of the loan—difficulty would arise as to what would be the position of a purchaser who died, wanted to move to another part of the United Kingdom, failed to keep up his instalments, maintain his property, &c. This could be met by the Government establishing under their scheme a municipal register of properties. The existing legal methods of conveyance are considered to be too costly a proceeding for a scheme of these dimensions. The property acquired would be entered in the register, and a short form of certificate (passed under the seal of the municipality) might be issued to purchasers setting out that they are the registered owners of a certain property upon which a loan has been granted, quoting the amount of the loan, or balance remaining of loan, at time of purchase or repurchase. In the event of a purchaser desiring to transfer his interest it should be considered sufficient legal transfer for his signature to appear in the municipal register as having no further beneficial interest in the house in question, by his surrendering his certificate of ownership, and by the issue of the new certificate.

A person desiring to sell—owing to death, removal or other causes—would know, or could ascertain from the municipal authority, the balance of mortgage remaining unpaid, and he would be able to sell the house to a buyer who would take over the payment of the remaining amount on the mortgage. Assuming a man had repaid £200 off his mortgage and sold the house for £250 subject to the uncompleted amount being paid off by the new purchaser, he would be entitled to apply this £250 to his own purposes.

Special provisions would, of course, have to be made in the Government scheme for defaulting purchasers, or for those who failed to keep the property in reasonable repair. These powers, it is suggested, should be vested in the municipal authority, who should have power to eject the original purchasers and to resell their properties. Any gain or loss entailed to pass to the municipal authority.

* These schedules have been received, but are not given here owing to lack of space.—ED.

It is suggested that it should be the duty of the municipal authority to superintend the erection of the houses within their area, certify completion, and issue certificates for payment of Government subsidy, &c.

Formal Proposals.

	NOTES.
(*a*) A definite number of houses to be built—say, 500,000.	(*a*) and (*b*). A definite project such as this would tend to stabilise the industry and arrangements could be made to cope with the project by both employers and employees.
(*b*) In a definite number of years—say, 10.	
(*c*) A definite subsidy to be given—say, £100.	(*c*) The subsidy would cost the State only £5,000,000 per year for 10 years, or in all £50,000,000.
(*d*) To definite parties—say, those earning £10 per week and under.	(*d*) The object here is to ensure that the subsidy goes to the right people.
(*e*) A definite maximum sum to be fixed for cost of house to which subsidy would apply—say, £650. Cost to include land, also all fees and other charges.	(*e*) Some limit must be laid down in order to prevent undue profit or a monopoly being secured for material of any kind.
(*f*) A Government guarantee to be given for a loan free from all taxes and charges, present or future, redeemable in, say, 50 years. If this were done the loan could be raised at a low rate. Figures are given showing the weekly payments with interest at 2½, 3 and 3½ per cent., redeemable each in 30, 40 and 50 years.	(*f*) A loan redeemable in, say, 50 years and at a low rate of interest is essential in order to make the scheme economically sound. This would cost the State nothing; it would mean merely using the credit of the State for the advantage of the working classes, which is only proper, and for this purpose it is reasonable that the State should be asked to forego income tax and charges of all kinds on the loan. There are many ways this loan could be raised in order to ensure that people with small amounts could utilise it.

It is also suggested that everyone applying for a subsidy should be asked to contribute at least £50 in either weekly or monthly instalments. The contributions to be at the rate of not less than 2s. 6d. per week. This would mean that it would take over 7 years to contribute the £50, but it may be assumed that there are many thousands who could contribute the £50 in a shorter time. With a house costing £650 there would be thus £500 to loan as follows :—

Cost of House		£650
Less Contribution from purchaser	£50	
Subsidy	100	
		150
Amount of Loan..		£500

If this were loaned at 2½ per cent. per annum redeemable in 50 years, it would work out as follows :—

	Per annum
Redemption of loan	£10
Interest for 1st year at 2½ per cent. per annum	12 1
	£22 1

As £10 would be paid off each year, the interest would be reduced by 5s. each year for 50 years when the last instalment would be paid off

Ts would mean a decreasing payment each
yr, which is a better proposition than an
a uity. Thus the payment would begin at
8 8d. per week, gradually reducing itself until
tl 50th year, when it would entirely cease.
I: per cent. per annum had to be paid for
l loan, the weekly payment would be increased
approximately 1s. per week for the 1st year.
ocal authorities to be asked to carry out the
owing duties :—

) To authenticate each applicant in their
area as proper for the subsidy and suitable
ther ways.

) To supervise the erection of and to certify
he local builder that the houses in their
were completed according to the contract,
n automatically the subsidy and final
ment of the loan would be due.

) To be responsible for the collection of the
kly or monthly payments immediately the
ses are occupied, as well as the 2s. 6d.
kly or other contribution towards the £50.

) If any deficiency or liability should occur
local authority to be responsible for such;
, however, to have full power to resell the
se and arrange such terms with the old
er as they think best.

OTE.—The local authorities under this
eme, not having any responsibility other
an above, it seems reasonable that they
ould be asked to undertake these duties,
ecially as they would have the machinery at
d for dealing with them through their sur-
ors and rate collectors.

THE GENERAL ELECTRIC CO. AT WEMBLEY

HE General Electric Co., Ltd., of Magnet
ise, Kingsway, W.C. 2, recently invited a
mber of guests to visit their exhibit at
mbley. The stand, which occupies a central
sition in the Electrical Engineering Section
the Palace of Engineering, illustrates the
ility of the company to carry out everything
trical. With the assistance of the Fraser &
lmers' engineering works, which the G.E.C.
ntrols, heavy mining and other general
ineering plant is shown. The stand is con-
ucted as a two-floor building, the bottom
or showing industrial applications of elec-
ity, an electric kitchen, electric railway
paratus, a hand telephone exchange, and an
ctric shop. External to this building is
,000 kw. G.E.C. Fraser & Chalmers' turbo-
lternator with the rotor being slowly turned,
50 kw. rotary converter, transformers, and
power switchboard—the whole representing
h G.E.C.'s activities in electric power station
substation work. An exhibit which attracts
h attention is that of the Fraser & Chalmers'
conveying gear, in operation. On the upper
or of the stand is a room in which is shown
long plan the G.E.C. works at Witton, at
ammersmith, and at Erith.

Mr. Hugo Hirst (the chairman of the com-
ay), speaking of the exhibition at a luncheon
n connection with the visit, said the idea of
h great gathering together and display of the
ources of the Empire was a high conception,
ugh he thought the Government had not
orded the support to the manufacturers
ch it might have done. Too much respon-
ility had been thrown on the manufacturers
the matter of guarantees. He himself had,
the first, supported the suggestion of a
plete all-British electrical exhibit. He
not expect any return for the display from
mmercial point of view. For the average
sor an engineering exhibition was something
cold. The thought, care and organisation
ch was behind the apparatus displayed could
be brought home to the layman. They had
told there was a slump in engineering.
did not believe it to be a slump; it was the
come of extraordinary conditions, and the
ling-up process all over the world must be
c. The electrical trade was a basic trade for
l industries, and by its success alone could
r industries be brought back to success.
He was convinced that before long the "cheap unit" (of electricity) would become a plank in the political platform of one or other of the political parties.

THE DEVELOPMENT OF PORTLAND CEMENT

THE developments that have taken place in connection with the manufacture of Portland cement during the last quarter of a century have been very remarkable, and it is not too much to say that without these developments a good deal of the constructional work of to-day would have been impossible. Engineers would have hesitated to undertake such constructions as large-span concrete bridges, concrete roads, or concrete piling with the average cement that was on the market some twenty-five years ago, and the efforts that cement manufacturers have made to improve their product have been rewarded with a large extension of its uses.

During the period mentioned, the rotary kiln has almost superseded the stationary brick kilns in which cement was burnt, and this change alone has had a great influence upon the cost of manufacture and the quality of Portland cement. In the old brick kilns, coke was the fuel principally used, but at the present day coke is neither so abundant nor so cheap, and it would probably be impossible to fulfil the present-day demands for cement if kilns using coke were as prevalent as they were at the beginning of the present century. The rotary kiln not only enabled coal to replace coke as the fuel for burning, but small coal, which is usually much lower in price than the average run of a coal mine, can be used, and this has had an important effect upon the cost price of the cement.

The advent of the rotary kiln also revolutionised the quality of Portland cement, because with this kiln it is possible to eliminate all underburnt material, which material has a deleterious effect upon the quality of the cement. With the old brick kilns it was impossible to prevent underburnt material issuing from the kiln with the properly burnt product, and complete elimination of the underburnt portion was not practical. With the rotary kiln, moreover, the amount of labour required per ton of cement is greatly reduced, especially with the large kilns, which now run up to 250 ft. in length and 10 ft. in diameter.

Another direction in which progress has taken place is in connection with the grinding of the cement. In the earlier days of the industry, mills of the edge runner type were commonly used in conjunction with sieves and air separators, but the tube mill with metallic grinding bodies has now almost entirely replaced these, and in consequence it is possible to obtain a very finely ground product without prohibitive cost. Another feature of modern cement manufacture is the general economy of labour arising from the adoption of mechanical appliances for digging raw materials and for conveying materials throughout the factory. Such mechanical appliances, while reducing the labour cost, tend to swell the repairs cost, and naturally add considerably to the capital cost of a cement factory.

To the cement consumer, development in the cement industry is particularly noticeable in the quality of the cement. Towards the end of the last century, if a cement had a tensile strength when neat of 350 lb. per square inch at seven days, it would satisfy most specifications, while the requirements for soundness or stability were satisfied if the cement did not expand when immersed in cold water. The rotary kiln product, however, with its freedom from underburnt material, enabled the standard of quality to be raised considerably, and in consequence the first British standard specification adopted a minimum seven days' neat test of 400 lb. per square inch, and embodied the Le Chatelier boiling-water test for soundness. Subsequent editions of the standard specification raised the seven days' neat test to 450 lb. per square inch, at which it now remains, while the sand test (3 sand to 1 cement) has a minimum of 200 lb. per square inch at the same period.

It is, however, common knowledge among cement users that the present British standard specification does not represent the quality of the cement on the market, and it is not at all uncommon for cement tests to show double the strength required by the specification. This is a disparity that will no doubt be rectified before long by a new edition of the standard specification. It is doubted, however, whether modern cements are being used as economically as their high quality would justify and as, indeed, their increased cost of production and high selling price demand. If concrete to fulfil a certain purpose was strong enough fifteen or twenty years ago, when gauged at 6 to 1, then with modern cement the same strength could be obtained with a gauging of 8 to 1, or even weaker. In this connection it should be added that, if impermeability is a necessity, then the gauging must be based upon this factor and not upon strength. Again, the permissible stress to which concrete may be submitted in compression, according to the rules generally adopted by engineers, has been for many years 600 lb. per square inch, but during the period this rule has applied the strength of the cement on the market has increased by a large percentage, so that a similar increase in the permissible stress would be warranted, and this would lead to a reduction in the dimensions of concrete members and an economy in the cost of work. If cement users could fully appreciate the superiority of modern Portland cement to its predecessor of twenty, or even ten years ago, there would no doubt be considerable economies effected in concrete constructional work.

THE EVICTION BILL

THE Rent Bill known as the "Prevention of Evictions Bill," which was adapted by the Government from Mr. Simons's Bill, has been read a third time in the House of Commons. We referred to Mr. Simons's Bill in our issue of April 11, and the Government Bill on April 25.

On the Report Stage this Bill, which consists of one clause, stood: "Paragraphs (iv) and (v) of subsection (1) of section 4 of the Rent and Mortgage Interest Restrictions Act, 1923, are hereby repealed as respects pending, as well as future, proceedings, and the following paragraph shall be substituted therefor: 'Where the dwelling house is reasonably required by the landlord for occupation as a residence for himself and the Court is satisfied, having regard to all the circumstances of the case, including any alternative accommodation available for the landlord or the tenant, that greater hardship would be caused by refusing to grant an order or judgment for possession than by granting it.'"

This paragraph has been amended by inserting after the word "landlord" the words "not being a landlord who has become the owner after May 5, 1924."

It is still difficult to see why this Bill was introduced at all, as it does not represent in any way the intentions of the Government in the Bill they introduced to deal with the Scotch Evictions, which was defeated, and it only introduces fresh confusion in the law.

The repealed paragraphs referred to cases where "the existence of alternative accommodation shall not be a condition of an order or judgment on any of the grounds specified in paragraph (*d*)," and both paragraphs included the husband or wife of the landlord who required the house for themselves or for sons and daughters over 18 years of age.

Paragraph (iv) applied where the landlord became landlord before June 30, 1922, and under that paragraph the house had only

" reasonably " to be required; but paragraph (v) applied where the landlord became landlord after that date, and in that event the court had to be " satisfied that greater hardship would be caused by refusing to grant an order or judgment than by granting it."

Both these paragraphs have been repealed, and the new paragraph omits any reference to the husband or wife of the landlord, and does not apply where the house is required for occupation by sons or daughters, and, further, it re-introduces the question of alternative accommodation in a portion of the Act which relates only to cases in which alternative accommodation is not to be a condition of an order for possession, and it is hard to see that it adds anything practical to the general condition laid down in paragraph (*d*).

The Bill thus only adds conatus in the law, and appears to serve no possible useful object. It is, however, very significant that in the debate on the Report Stage several members in their speeches appeared to assume that the landlord requiring possession of his house had " to find " alternative accommodation for the statutory tenant, but we may point out that this is going further than the law requires, which is only to prove that alternative accommodation is " available." The number of Rent Restriction Bills introduced this year is very bad for housing, and renders the owning of house property almost impossible. Mr. Gardner's Bill is still being considered in Committee.

BUILDING OPERATIVES' WAGES

MR. F. ROBINSON writes:—

SIR,—In May 2 of *The Builder* you allow a statement to appear that building operatives earn £4 2s. per week. This, as you and Lord Wolmer must surely know, is not correct. Practically *all* trades earn 1s. 8d. per hour and work 44 hours per week = £3 13s. 4d. Out of this they are compelled to leave 1s. 2d. for insurance—leaving £3 12s. 2d.; Christmas, Easter, Whitsun and August holiday, they are shut out and, of course, lose their money. They have to stand the whole time during the eight hours every day, and old men over sixty-five have still to keep at work. If not feeling well, a man dare not stay at home for a day or so, otherwise wife and children have to suffer. No holiday at all during the year is allowed, except a man loses all his pay. Surely, neither Lord Wolmer nor any other humane capitalist would wish his workers to have a *less* share in this world's goods. Please put a correct statement of building operatives' wages in your next issue, if possible.

"Celotex" Film.

Messrs. Bivert & Firth recently showed a film demonstrating the processes in the manufacture of "Celotex." The film showed how the mountains of waste are baled, something like chaff, and are carried along endless conveyors to the Celotex manufacturing plant. Resultant pulp is then fed into the board machine, where the fibres are woven and interlaced into a board having great tensile strength, and valuable insulating, sound-deadening, and shock-absorbing properties, in addition to extreme lightness, weighing only 60 lb. per 100 sq. ft. Celotex can be used in connection with concrete, forming a direct bond with it, and preventing condensation and extreme expansion and contraction, for interior or exterior finish, for cold storage and refrigeration, for portable buildings, piggeries, dog kennels, fowl houses, &c., and also for box making.

Fortune Theatre.

With reference to the new " Fortune Theatre," illustrated in a recent issue, we are informed by the Trussed Concrete Steel Co., Ltd., of 22, Cranley-gardens, South Kensington, S.W.7, that they were responsible for the reinforced concrete designing of this building.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Altrincham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Ashton-under-Lyne	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barnsley	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½

(For rates of wages in the Building Trade in Scotland, see page 807.

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

PROPOSED NEW BUILDINGS & OTHER WORKS *

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

ABERDEEN.—Plans passed by T.C.: Bungalow, Queen's-road, for Mr. Charles Sangster, per Mr. George Watt, architect; house, Queen's-road, for Mr. Robert Sinclair, per Mr. John Milne, architect; Reconstruction of building, Chronicle-court, for the T.C.

ACCRINGTON.—The Ministry of Health has given formal sanction for the borrowing by the Accrington Corporation of £49,834 for the erection of 103 additional houses on the Laneside Estate. The Council are recommended to seal the contract with the C.W.S. for their erection on terms arranged.

ALDERLEY EDGE.—The U.D.C. has decided to borrow £5,000 for the purpose of erecting eight additional houses.

ALTRINCHAM.—The D.C. have made application to the M.H. for sanction for a loan of £13,700 for the erection of 28 houses on the Oldfield Brow Estate. The United Services Club are proposing the erection of Club premises on a site in Moss-lane. The parishioners of St. Albans, Broadheath, are proposing erecting a church house.

AMMANFORD.—The U.D.C. has received from Mr. G. H. Davies, the engineer, estimates of the cost of the proposed town sewerage scheme. The sum of £33,418 is given as the cost of the domestic scheme to which must be added £2,730 for easements, &c., to link up with the proposed joint sewer to be constructed by the Ammanford, Pontadawe, Llandilo and Cwmamman Councils.

ARMTHORPE.—The village lay-out plan includes sites for a school, station, village green, hotel, institute, shopping centre, and playing fields; also for 1,000 houses with a sewerage scheme.

ASHTON-IN-MAKERFIELD.—Plans approved by the D.C.:—Proposed control station adjoining Parkside Mills, in Bridge-street, for the Lancashire Electric Power Co.——The M.H. has approved a scheme for the erection of a new central school.

AYLESBURY.—The T.C. has decided to build new offices for the town clerk, borough accountant and staff, to complete the town hall improvement scheme. ——Plans passed by T.C.: Houses and shop, Penn-road, for J. E. Brinley.

BALLYMENA.—The Ministry of Home Affairs has approved of the application of the Council for liberty to secure a loan of £30,000 to build a new town hall.

BASINGSTOKE.—Plans passed by T.C.: Shop and office, Church-street, for Mr. J. F. Powell.

CARDIFF.—A fire occurred at Cardiff recently at the Cambrian Printing Works of Messrs. William Lewis & Co. and the warehouses of a flour company. The combined damage is estimated at £150,000.

ELLAND.—Damage estimated at £15,000 has been caused by fire at Long Lea Mills, owned by Messrs. J. B. Battye & Co., Ltd.

The Use of Professional Affixes.

In the Chancery Division recently the Institution of Civil Engineers brought a motion against two defendants for an injunction restraining them and each of them from using, or allowing to be used, after or in connection with their name, or in connection with any profession or business carried on by them, and from printing or writing on any document issued and published by them or either of them the words "Associate Member of the Institution of Civil Engineers" or any letters or words or designation to the same effect.

Mr. Rolt, K.C., and Sir Hugh Fraser appeared for the plaintiffs; and Mr. E. C. Morey for the defendants.

Mr. Rolt said the subject of the plaintiffs' complaint was that the defendants had employed after the name of one of them the description "A.M.Inst.C.E." in the printed headings of letter paper. That was not justified, and he understood that the defendants were willing to treat the hearing of the mot on as the trial of the action, and to submit to a perpetual injunction in terms of the notice of motion and pay the costs.—Mr. Morey said that that was so.

Mr. Justice Tomlin said there would be an order accordingly.

Mr. Morey said that he was instructed to say that the description had been inserted in the headings of a few letters by inadvertence.

Obituary.

The death took place recently of Mr. W. Not of Albrighton, near Wolverhampton, at the age of sixty-nine. For many years he carried on business as a builder and contractor.

HOUSING IN LONDON

THIS "Municipal Pamphlet"* falls into two sections. It deals with the inadequate standard of housing in the past, and with Labour's proposals to set housing on its feet in the future. With its aims and ideals generally we are in complete agreement; it is when we are told that house rents should be permanently subsidised by the taxpayer that we disagree. Mr. Morrison falls into error in company with Major Barnes in failing to realise that the duty of maintaining its employees in reasonable conditions of life is a burden that must ultimately be met by industry itself and by nobody else. We would like Mr. Morrison to prove the fairness or the desirability of calling upon the tax-payer to subsidise those industries that are parasitical to the extent of being unable to pay wages that can support their own people, and at the same time to tax the efficient industries (which can and do meet this first charge) in order to support the bad ones as well as themselves. Owing to abnormal conditions some form of temporary assistance is indispensable, but Labour will go seriously wrong if it confuses an unfortunate temporary necessity with a condition that could answer permanently. While private enterprise may have failed to provide adequate housing in the past, this is no sound argument for saying that it is incapable of ever doing so. May it not be that it was not properly directed owing to the absence of a public conscience? If this were so it may be better to aim at kindling the public conscience rather than to attempt to destroy private enterprise when we have only uncharted seas (evidently full of rocks) on which to embark as an alternative. It is hardly in dispute that no other agency can produce houses as cheaply as private enterprise, and this applies to houses of good standard as well as to poor houses. Labour cannot shut its eyes to this truth.

* "A Housing Policy for London." By Herbert Morrison, M.P., L.C.C. (The London Labour Party, 58, Theobald's-road, W.C.1.) Price 1d.

L CXXVI.—No. 4242. MAY 23, 1924.

THE HOUSING QUESTION AGAIN

AFTER many postponements there are indications that we shall shortly see the long-promised housing programme of the Government, and already certain important details have been published. We do not know whether the consideration of the complete scheme will do thing to modify first impressions, but the information which so far been published does little to encourage a feeling of efulness that a solution of the problem has been found. th the difficulties inherent in the subject we are only too ll acquainted, but it cannot be said they have been made ier by the methods adopted by successive Governments, l this new scheme to provide houses does not encourage belief that the present Governments will succeed where ers have failed. We know, of course, that the problem will solved one day, and because houses are urgently needed by community they will once again be provided, but when t time comes we shall probably find that the community e got what they want, as they get other things they want, h little or no help from the State.

The present difficulties are probably due in part to the that house building in the past was carried out too cheaply, l that the small profits which satisfied builders and speculators e always cut too fine. This may not have mattered while ple were willing or were compelled to occupy the dwellings t were provided, and builders lightly faced the risks involved loing work on the lowest margin of profit; but with the stent and proper demand for an improved standard of elling and builders determined to protect themselves against uncertainties always present in building work and greatly eased by the numerous difficulties which resulted from the increased costs were inevitable; and we believe we must pt a permanent increase in the cost of this class of work t altogether from the increase due to higher wages and er materials. The chances of a decline in labour costs he industry can be estimated from the fact that protracted otiations between employers and operatives have just taken rn in favour of a peaceful settlement on the basis of an ease of one penny an hour. Moreover, the Report on the ent Position in the Building Industry, which was recently d, and such details as we have of the Government's inten- in the Bill about to be introduced, do not afford ground belief that the Government and their advisers are under illusions as to the possibility of any substantial reduction e cost of good class houses for the working classes in the future.

o useful purpose can be served in attempting to apportion e for the present position, and all we need say is that most le competent to express an opinion on the matter believe that ad of accepting the position of responsibility for providing es after the war the Government should have attempted tial repeal of the Rent Acts, and encouraged in every way ble those who understood the business of house building, who had provided houses in the past. Rents would have of course, but everything was costing more, and most e were in a position to pay, as we know they did. There e no doubt that more and more houses would have been until the shortage had been made good, and rents would fallen as the supply increased, and the cost in any case have been borne, not by the community as a whole, but ose who were being supplied with what they wanted. Even now may not this, or something like it, be the best way out of our difficulties? Sir Ernest Benn, in a recent letter to the *Times*, argued as a publisher that if the housing market had been as free as the market in books or newspapers, if the Statute Book had not been encumbered with the 390 Acts of Parliament which provide for the housing of the working classes, if the enterprise which has been devoted to the making of books and newspapers had been turned on to houses, we would not now be embarrassed as we are by the housing problem.

Various Governments have now tried their hand at providing houses for the working classes, and we know at what cost and with what inadequate results. Are we likely to do better under the scheme so far foreshadowed by the present Government? We very much doubt it, and we shall be surprised if Parliament will agree to a subsidy of £9 for forty years with a municipal contribution of £4 10s. Even if successful in providing houses, the cost would seem to be prohibitive, and notwithstanding an agreement with the Industry it is doubtful whether the subsidy will stimulate house building sufficiently to produce the houses, which cannot be provided without an increased supply of building labour and the maximum effort by builders and their employees. The fact is there is a shortage of labour in the Industry and builders are well employed at the present time, and without more labour and an increased output we cannot hope to provide the large number of small houses needed, subsidy or no subsidy, unless the work which now keeps the Industry fully occupied is to suffer. Again we doubt whether Parliament, knowing something of the loss to the country as a whole which interference with this work would entail, and the enormous cost of the new housing programme, will agree to proposals which appear to promise such results. Judging from recent debates in Parliament, we should be less surprised to hear that the Government, willing to grant a subsidy of £9 for forty years, with a municipal subsidy of £4 10s., should propose to repeal the Rent Acts and give relief to really necessitous tenants to pay the increased rents which are the result of the better standard of housing and the increased costs of the present day. In our opinion the payment of a subsidy on houses built is the wrong method to adopt, as it creates artificial conditions in the Industry, and in so far as it succeeds it creates other evils of perhaps equal magnitude. The recent Report on the Present Position in the Building Industry is an admirable document in many ways, and as a contribution to the general stabilisation and improvement of the Industry it is welcome, but if the price we pay for an agreement between the Government, builders and operatives in the provision of houses is a greatly increased cost not only of the houses themselves, but in the price of building of all kinds, is the agreement worth while even to the Industry itself? Again, while welcoming the suggestions contained in the Report that the deficiency of labour will be dealt with, are we right in thinking that a lower standard of output appears to be adopted than that of the pre-war period?

Two or three salient facts stand out definitely in this housing question. Can we hope to cope with the housing need with the amount of skilled labour we have at our disposal? Can the country afford such an outlay of capital as is suggested? Can official control of building succeed better to-day than it has done before? Finally, can a purely industrial problem fairly be made a pawn in the great game of politics?

NOTES

The Institute Election. If at this late date there still remain any members of the Institute who have not yet filled in and returned their voting papers, we would remind them that it is but little that each of them is asked to do, but that that little may have a vital effect on the result. The present Council has gone very thoroughly into the attempt to solve a difficult problem, and has produced a scheme which has met with the approval of a very large number of representative architects as the one most likely to produce the best results. If there are any members of the Institute who have not yet recorded their votes they should fill in their forms and send them in at once. An indecisive result could give satisfaction to neither party, and everyone must wish that the verdict of the electorate will leave no doubt as to the opinions of voters. The last day for sending in voting papers is Saturday, May 24.

St. Paul's and the Bridges. Two points of great present importance have come to the front again this week. One is the serious view taken by Mr. Macartney, as Surveyor to St. Paul's, as to the safety of the Cathedral if the St. Paul's Bridge scheme is carried out. The other is a recommendation from the London County Council that a commission be appointed to consider the question of cross-river transport; the commission to be composed of representatives of the City Council and the County Council. The work of this commission is obviously of great and pressing importance, and the authorities responsible for the good government and well-being of London are the proper ones to deal with it. But we should never forget that the City of London is an Imperial City—the central point in a great world-wide Empire—and its future aspect and development are matters of Imperial concern.

St. Paul's Bridge. The strongest possible argument against the St. Paul's Bridge is, says Mr. Caröe, that which Mr. Waterhouse and Sir Ed. Marshall Hall brought forward in the *Times*, viz., the bringing of fresh traffic athwart existing streams of heavy traffic. Of course, this argument would tell against a high-level bridge at Charing Cross if it deposited fresh traffic directly into and athwart the crowded Strand.

Vital Points in Housing. We have tried to focus attention in our leader this week on the salient facts about housing, because amongst the endless amount of discussion about it one is apt to lose sight of the vital points. Many of those who know something of economics maintain t the principle of subsidies is wrong, that we simply cannot afford to those suggested. But if we had all money we need, even then what sho we say of the following from Sir Joynson-Hicks? "The Wheatley sch does not touch the real trouble, whic labour. The unions have declined admit ex-Service men. They decided 1920 to resist dilution with the utm strength of their organisation, and, make matters worse, they started 44-hour week. The only suggestion Minister has to make on the question dilution is to improve the apprentices system, which would mean that in years' time we might get a few thous more bricklayers. The thing is absu The only chance is dilution, and, if nec sary, Government instructional clas to teach bricklaying in defiance of unions. The only way to cure the is to get back to private enterprise, a to tell the building trades quite fran that the subsidies will not be increase

Swedish Architecture in London. The Exhibition of Swedi Architecture at the g leries of the R.I.B.A. is visible proof of the weal of inspired architectural talent which at the disposal of the Swedish natio, an lays a stress upon the tact and visio that have prompted various Swedi authorities to place their building proje in England in the hands of British arc

Swedish Church at Christiania. Mr. W. Wahlman, Architect.

CHIBITION, 1924.
"Charlotte Brontë."
. F. Doyle-Jones, A.R.B.S., Sculptor.
(*See p.* 826.)

The Swedish Church at Marylebone, Swedish Chamber of Commerce in ty-square, and the reconstructed ish Legation in Portland-place, are stances of the best and highest type odern design that can be produced s country, and each takes its place ally in a way that no exotic expres- f a foreign style, such as another might have been tempted to e in its place, could have achieved. therefore owe a double debt weden, in that she has contri- in so handsome a fashion to the y of our streets, and that in the she has suppressed the differences character as a foreign power and wledged her position as a welcome in so graceful a way. Nations like duals lose nothing in Rome by as Rome does.

Canny.

Were it possible to detach the consideration of labour questions from party feeling xamine them in the light of what is we should do better. For men may uated by good motives in thinking very falsely, and this, so it appears to us, is the case in regard to ca'-canny, or going slow. There is no doubt that many men think restricted output encourages employment. We shall not get them to understand such thinking is fallacious by accusing their motives and charging them with dishonest intentions, but through making them see that their action does not effect the result they seek. That there is a fallacy contained in such a view we do not doubt, and the men's unions are wrong in supporting such methods. But we must distinguish what is erroneous from what is evil in intention, and until we give more credit to the worker's heart, which is often more furnished than his head, we shall remain in a condition of mutual distrust and suspicion. On both sides, masters and men, we must give more credit to the motives inspiring them.

An Instance of Increased Output.

We may instance the case of a builder whose bricklayers are laying 350 to 400 bricks a day, perhaps less. The builder with a narrow margin of profit, a good deal calculated on the number of bricks he can expect to get laid each day, finds himself, as the result of restricted output on the part of the men, coming out at a loss. So he calls the men together, puts the figures before them, explains the situation, and offers each bricklayer a bonus of 4s. per day, to be divided between him and his labourer. As a result, instead of 350 bricks being laid per day, the amount goes up to more than 600. This continues for a few weeks only, when the unions, we are told, step in and forbid the bricklayers to do it any longer. Now the first and perhaps worst difficulty contained in all this is that the men do not really believe what the builder tells them. That is to say, suspicion and distrust of each other's motives largely decide the issue. But such motives should not govern them in justice to each other, for the evils growing out of such suspicion are many and destructive to the men themselves. For a man undertaking a job at a certain wage, and who is not using his time in the best way, is doing himself no less injury than his employer. A bricklayer working ca'-canny cannot enjoy that self-esteem and satisfaction which gives pleasure to his work. If men are producing less than they ought, the reduced value of their output depresses the industry they are engaged in. By doing our best in any work done we must create more value than by restricting our output, and production is therefore encouraged, so that, as a matter of fact, the effect of ca'-canny is rather to increase unemployment, because it depresses industry, and lowers the self-respect of the worker. We say this not as taking any side at the moment, but to show that suspicion of the motives actuating the men is no less mistaken than their suspicion and distrust of the masters. We must reach a better level of respect for each other, and in so doing we shall find half the difficulties of the present time falling away. Without confidence and initiative, unless we can restore human relationships, all our politics, all our organisation, are of no avail.

Stadium Advertisements.

As the result of protests made we understand that the advertisements on the Stadium will be removed. To undo with our right hand what we do with our left seems an inconsequent occupation, and having built the Stadium with some consideration of architectural dignity and proportion it appeared unaccountable that these should be later blotted out by advertisements. We are therefore very glad to hear that good sense has prevailed and that the disfiguring advertisements are to be taken away.

Mr. A. B. Pegram, Sculptor.

GENERAL NEWS

Caversham Bridge Closed.

Caversham Bridge has recently been closed for traffic and is to be demolished to make way for the new £78,000 bridge to be built by the Reading Corporation.

Waterloo Bridge.

In the course of a letter, Major F. William Wynn puts forward the following propositions with reference to a pontoon bridge as a solution to the temporary bridge problem: (1) That there is no engineering difficulty in placing a pontoon bridge near Waterloo Bridge; (2) that such a bridge could carry an important part of the traffic; (3) that the expense would be trifling as compared with that of any other form of temporary bridge.

The A.A. Ball.

The Architectural Association's Annual Dance, held at the Galleries of the Royal Institute of British Architects on Friday last week, was a great success. The dance had been organised in connection with the Exhibition of Modern Swedish Architecture now on view at Conduit-street, and in honour of the architects who had collected and brought over the collection. It was, in fact, as stated on the programme, an "Anglo-Swedish Night." The decorations and many of the dresses had been designed and executed by the staff and students of the A.A. School. The Swedish national colours entered largely into the colour scheme. A fancy dress dance is a thoroughly English institution, but the many visitors from Sweden entered into the spirit of the thing with great enjoyment, and by their enthusiasm greatly helped the success of the show. Among those present were His Excellency Baron Palmstierna, the Swedish Minister, accompanied by Baroness Palmstierna, a large number of the Swedish colony in London, and many Swedish architects who are visiting London for the Exhibition.

Blackpool Memorial: One of the Large Panels (14 ft. 6 in. by 6 ft.).

Mr. Gilbert Ledward, Sculptor.

COMPETITION NEWS

Dunfermline War Memorial.

On the recommendation of Sir John J. Burnet, assessor, the Dunfermline War Memorial Committee recently accepted for the Dunfermline war memorial a design by Messrs. Taylor & Young, architects, Manchester; a cenotaph will be the main feature of the memorial. Premiums in the competition, for which thirty-four designs were forwarded, were awarded to Mr. Robert Brodie, Cathcart, Glasgow; Mr. Joseph Addison, Leeds; and Messrs. Allan & Friskin, Dundee.

Scottish Rugby Union Stand.

The Scottish Rugby Union invite designs for a stand at their new playing field, Murrayfield, Edinburgh. The structure may be of steel and brick work in combination with ferro-concrete, or entirely of ferro-concrete. Premiums of £100, £50, and £20 are offered respectively. Particulars from Mr. H. M. Simson, 134, George-street, Edinburgh. Sending-in day, June 9.

Barrow-upon-Soar and Salford.

The conditions of the Barrow housing and Salford baths competitions are not in accordance with the Regulations.

Branch Library, Gabalfa, Cardiff.

The President of the Royal Institute British Architects has nominated Mr. S. Greenslade as assessor in this competition.

Leeds Maternity Hospital Extensions.

The President of the Royal Institute British Architects has nominated Mr. R. Bu Dick as assessor in this competition.

British Pavilion: International Exhibition of Decorative Art, Paris, 1925.

The President of the Royal Institute British Architects has nominated Mr. H. Goodhart-Rendel as assessor in this competitio

Other Competitions.

Other competitions still open include th following (the dates given are, first the sendin in date, and second the issue of *The Builder* which full particulars were given):—Industri Designs (June; Dec. 21, 1923). Ross-Smi Memorial (Sept. 30; Feb. 21). Glasgow Publ Hall (July 4; May 2.)

From the Swedish Architecture Exhibition at the R.I.B.A.

Church at Masthugget, Gothenburg. Mr. C. Ericson, Architect.

EXHIBITION OF MODERN SWEDISH ARCHITECTURE

By A. E. RICHARDSON.

E Council of the Architectural Association ell as the Council of the Institute have y earned the thanks of the profession and ublic for arranging the present exhibition e new gallery of the R.I.B.A. at No. 9, uit-street.

e exhibition consists of the designs and ls of works by twenty-seven architects, y all of whom have been inspired by n. But some of the works reflect tradi- l tendencies and others aim at being rn with malice aforethought. It is not ble to deal with every work shown, but following selected at random will prove liversity of interest of the exhibits.

ik Lallerstedt, of Stockholm, shows a illustrated by a number of good draw- Here the theme is a version of baroque. ıar Hjorth exhibits the Nobell Institute e and Tenement House, Stockholm; some petitive drawings; a factory at Nybohus, xcellent rendering of an industrial project, hich simplicity of statement is reflected cally; and the charming Iduna-Hall ansen " Restaurant, Stockholm, which is elegant and explicit. This architect also bits drawings of industrial buildings, which onstrate that such schemes are capable of t statement without loss of charm. Some ıe designs show that the tradition of 1800 ill pursued as a basis of expansion; in certain of the drawings have the old- d quality one encounters in past engrav- Such buildings as the Art Gallery and Memorial Hall at the Gothenburg Exhibi- as well as the towers and pavilions, show t can be achieved by observing canons of taste combined with extreme simplicity. example, the model of the Gota Palace, ıenburg, is an object-lesson of scale ob- ed in the large sense.

ıe chief fascination of the exhibition is fine model of the new Town Hall, specially ared for the purpose by the City ıcil of Stockholm. This building, writing ectly, belongs to the later middle stage ıe period of reform. Designs for the work first made in 1901, and in 1902 that by ıar Ostberg was selected. At the time it suggested that accommodation should be ided for the Law Courts in addition to City Hall and offices. This early design, e ingenious, lacked the grace of the one uced two years later—it was almost ally symmetrical. The architect was fight- for freedom of expression, he wished to is building to its unique site, and realising the first that the building needed a tower oncentrated his whole thought upon the ct of an appropriate plan. All the time ave full attention to the subject in hand, in 1907 the site was prepared for building ations; but it was not until 1909 that the adhus " was decided upon in its ultimate , freed from the incumbrance of the Law ts. Two years later, on the present site, revised plan was started.

this time Ragnar Ostberg had resolved mediæval cast for the plan, which, as ted, is a masterpiece of simplicity. The in this case is the key to the subsequent t; it relies for its ultimate force entirely he causes and conditions, but there is an try in the arrangement of the halls and s, one of which is lighted by clerestory ows, which lifts the scheme out of the f ordinary systematised planning methods, ough it shows elementary failings. The model of the building is a complete in- ion of the validity of the plan; apart from ks in the circulation there is not a move in the upraising of the walls from horizontal platform. In the large ed areas the points of support, thanks to modern construction, are reduced to a minimum and this without tricks or engineering feats of questionable character. The granite columns that support the arcades are monolithic and have been calculated to carry the full load of the superstructure without the intervention of steel.

It is the one outstanding feature of the exhibition; all the others are but pale reflections of this remarkable work. Yet the effect has been obtained in the most natural and obvious way. The material is brick, but the bricks to English eyes are of an unusual size, measuring 11 in. by 5 in. by 3¾ in., with a delightful texture. To attain his result the architect had recourse to Venetian models; he may have been influenced by the doctrines of Ruskin and led to certain conclusions by analogies of site, but whatever his methods he has produced a fairylike palace which is both real and convincing and keeps the lamp burning. One feels, on reflection, that this is the type of work the best of the Gothic revivalists in England seventy years since were striving for; but in this case it is neither Gothic nor Classic, it is a work above style and yet pre-eminently stylish. The true secret is that it is a building both functionally and structurally sound, a building schemed to include the latent forces of building and to express its purpose to the spectator by means of perspective and common-sense proportions. One feels as one studies the model that one would like to become a Tom Thumb in order to frequent its courts and colonnades. Professor Ostberg has aimed at the utmost effect of light and shade both internally and externally. That the same theme has possessed him on other occasions is apparent from a study of the domestic work which he shows. For example, the Geber House contains, to a smaller scale, many features which appear in the Town Hall.

The designs by Ivar Tengbom include the Hogoalid Church at Stockholm, a building internally inspired by Eastern examples, but externally showing regard for local character; he also shows a bank at Stockholm and some office buildings.

Without calling attention to individual examples criticism must be directed to some of the plans shown, both for public buildings and works of domestic stamp. Accustomed as we are in England to logical reasoning and simplicity of statement, some of the plans appear to be crude; they show a complexity which is both confusing and unnatural, as though the designers have been aiming at an involved rendering of conditions. This is not so much the case with the Town Hall, but it is apparent that our Swedish friends in some quarters have become obsessed with the mediæval theme for planning, and in their desire to emancipate their minds from classicality they have gone to the other extreme. Bearing in mind the enormous influence this exhibition will have upon contemporary thought in this country, it is only fair to point out obvious faults in some of the works, and in the sphere of planning there is much to be avoided. The Engelbrekt Church at Stockholm is a case in point. The design both horizontally and vertically is too involved, too forced and complex to be taken seriously. The same remarks apply somewhat to the design for the University of Architecture and Engineering. As a whole the exhibition is most stimulating, and the designs and models in the main indicate the high aims and ambitions of our Swedish friends.

Sweden, like Holland, has not suffered by the war. Both countries are imbued with the political significance of building, and the astonishing vigour of the designs as of the sculpture and decoration proves sincerity of purpose. But salvation for the arts in England will not come from Sweden any more than it will come from America or any other country. The signs in Sweden are very much the same as those that are apparent on a much greater scale in this country, the symptoms are practically identical. Where Sweden scores is in the efficiency of her craftsmen, in the sound training offered by her technical schools, and in the ideals of her leading artists to be natural and national. It is this spirit which has resulted in the splendid if temporary buildings of the Gothenburg Exhibition and the permanent monument of the Stadhus. Swedish artists in the past have profited much by contact with England and other countries; the present exhibition, rich as it is in ideas and ripe in associations, will do still more to inspire Englishmen to higher flights, and will throw into stronger relief the progress of the arts.

One fact is clearly demonstrated, and that is the necessity of architecture to commerce, and in fact to every phase of well-being. In England much fine work is being accomplished, but it is obscured by the works unsuited to the conditions given, and by the listless indifference of some workers who do not understand the nature of the buildings or the material which they are working. When it is realised that building is above questions of style and fashion and is entirely dependent on cause for its effect, then and then only will general interest in art revive.

It is consoling to realise that Swedish architecture, as shown in this exhibition, avoids the pretentious character of so-called modern work; it is neither brutally aggressive like the German nor fantastic like some recent Dutch work. There is no place in building for extravaganza or fantasia; building, above all things, must be real and sincere or it falls precipitately into the abyss of the ridiculous. The present revolution of thought which is common throughout the world aims at emancipation from pedantry and a desire to be natural without slavish copyism of the antique. The world's masterpieces are above style or fashion; the truths of the past are comparable with the rungs of a ladder which have been mounted and still remain. The mistake made too often in recent years has been the exploitation of a style because for the moment it is foremost in the mind.

Viewed thus coldly and with keen and logical calculation the present status of building in Sweden can be appraised at its true value.

One would like to see an exhibition of contemporary English work arranged at the galleries in Conduit-street, perhaps to coincide with the Congress on Architectural Education this summer; it would form an interesting foil to the present exhibition. Such an exhibition should be limited to two designs from each exhibitor, and the designs should be subjected to the closest scrutiny. There is much fine work being done in this country, and it would be enlightening to both architects and the public if a small but vital display could be brought into being.

Swedish architecture as shown will serve the useful purpose of stimulating art of a similar nature in this country; the danger to be guarded against is a too blind acceptance of the examples which to insular ideas may appear novel and recent, whereas the contrary is the case. But the Town Hall at Stockholm is a masterpiece.

Blair Atholl War Memorial.

The Duke of Atholl, Lord-Lieutenant of Perthshire, recently unveiled a memorial at Blair Atholl to the men of the parish who fell in the war. The memorial stands about 12 ft. in height, and bears only the figures "1914–1918."

CORRESPONDENCE

Consolidation and Registration of the Architectural Profession.

We have received the following letter from the North Wales Architectural Society:—

SIR,—All Fellows, Associates and Licentiates of the R.I.B.A. will have received the Council's proposals for dealing with the question of registration and consolidation of the profession, and it will be noticed that the scheme is supported by most of the leaders of the profession. We venture to express the hope that all members practising in the North Wales area will support the proposals and record their votes.

For over forty years dissensions within the profession have taken up time which should have been used in other and better directions, with the result that architects have not been able to speak with the united voice of the whole profession and the advancement of the art of architecture has suffered seriously.

The proposals agreed between the Council of the R.I.B.A. and the Council of the Society of Architects for the amalgamation of the two bodies indicate a scheme which is fair and reasonable, having regard to the interests of the various classes of members concerned. It is the only practical scheme which has been evolved during the long controversy. With this problem solved and settled, the R.I.B.A. will be afforded the opportunity of exercising its true function—in the words of the Charter—"The general advancement of civil architecture and for promoting and facilitating the acquirement of the knowledge of the various arts and sciences connected therewith, architecture being an art esteemed and encouraged in all enlightened nations as tending greatly to promote the domestic convenience of citizens and the public improvement and embellishment of towns and cities."

While seeking to protect the interests of the profession, let us not overlook our responsibilities to the public, for man's duties extend far beyond the limit of his own personal interest and advantage. As architects, it is our privilege, as well as our duty, to foster a larger intelligence and culture in the art of architecture for the common weal.

G. A. HUMPHREYS, H. HAROLD HUGHES, H. L. NORTH, RICHARD HALL, E. COLWYN FOULKES.

Registration.

SIR,—I am not likely to be accused of ignorance of the history of, or the difficulties surrounding, this great movement, which simply means a compulsory test of adequate training.

I note with satisfaction that the present Council of the R.I.B.A., the R.I.B.A. Defence League, and the Council of the Society of Architects, are all now pledged to do their utmost to protect the profession by some measure of this kind.

The respective parliamentary advisers of the R.I.B.A. Council and of the Defence League appear to differ in their opinions as to the chances of success for any Bill submitted to the Houses of Parliament, but those of us who have devoted much time and thought for many years to the subject all know that without unity of the profession such a measure has no chance at all.

In their appeal to the corporate members of the R.I.B.A. the Council have pledged themselves, if and when the amalgamation scheme is effected, to do their utmost to obtain a registration Act.

The signatories of the Council's Appeal consist largely of recognised leaders of the profession. Surely it is our plain duty to support them by re-electing the present Council, and thus giving them an opportunity of fulfilling their undertaking.

It is for the R.I.B.A. Associates to say whether the advantages to be derived from the unity of the profession are not to be allowed under the amalgamation scheme to outweigh a modification of their status as graduates.

W. H. SETH-SMITH.

Registration and the Proposed Amalgamation.

SIR,—Mr. M. H. Powell is under a misapprehension as to the method of election to the Fellowship of the R.I.B.A., and he will not mind, I hope, if I state the actual position.

Direct election to the Fellowship from outside the Institute ceased about 1909, and since that date election to the Fellowship has been limited to candidates from the Associate class. Of the 958 Fellows whose names appear in the current Kalendar, 408 were elected from the Associate class, 356 were elected from outside direct before 1909.

There are two exceptions to this rule:—

1. Between the years 1910 and 1920, Licentiates who passed a special examination were allowed to qualify for the Fellowship, and 183 out of more than 2,000 did so. This privilege came to an end in 1920, and none has been elected since.

2. The Charter of 1909 gave the Council power to elect Fellows of special distinction by a unanimous vote. They have used this power with such extreme discretion that in fifteen years only eleven Fellows, or less than 1 per cent. of the total, were so elected.

ARTHUR KEEN,
Hon. Secretary,
Royal Institute of British Architects.

The Council of R.I.B.A. and Counsel's Opinion.

SIR,—Is Mr. Cross quite correct in his assumption (letter to you, May 16) that Mr. Shortt's opinion should be taken "cum grano salis" being founded upon two hypotheses, neither of which is based on fact?

The opinion referred to is the answer to a question put by the Defence League, "*If the amalgamation takes place, do you see any possible chance of architects obtaining registration?*" The answer is an emphatic "Yes." The Defence League does not like this, and Mr. Cross now objects that it must be accepted "cum grano salis" because a previous opinion was based upon two hypotheses which Mr. Cross declares were not founded upon fact.

This does not appear to be very good logic. Of course, outside the Defence League everyone agrees that the hypotheses upon which the first opinion was based are perfectly sound, and Mr. Cross appears to hold the opinion, which is opposed to the expressed opinion of the League, that however put the answer would be the same. Mr. Cross goes so far as to say that if the two Societies had put the question independently the answer would have been the same, *i.e.*, there is not only a chance but a reasonable probability of architects obtaining registration. Can we reconcile this with the often expressed views of the Defence League that we cannot make a "public case?"

Mr. Cross thinks the whole case for unification falls to the ground if, as he believes, registration can be obtained without it. As far as I am concerned, and I think many agree, unification under the R.I.B.A. is more important than registration by Act of Parliament. With or without registration by Act, I think unification is essential to architecture and to the profession, and am content to take a long view.

I do not follow Mr. Cross in his suggestions of ulterior motives on the part of the Society of Architects. As a member of the Unification Committee, I formed the opinion that the Society, having been founded and having lived for a particular object, was willing to put its own federation scheme on one side and accept the views of the majority in favour of unification; it certainly seems to me rather rough on the Society for important members of the profession to suggest "ulterior motives," and it assuredly does not flatter the intelligence of our own Council to say that they are being coerced for such motives.

JOHN E. YERBURY.

R.A. EXHIBITION, 1924.

Lady Caroline Paget.
MR. W. REID DICK, A.R.A. Sculptor.

Architectural Competitions.

SIR,—May I, a more layman, endorse certain remarks by the writer who reviewed the exhibition of competing designs for a cottage hospital at South Moor and Holmside Collieries Co. Durham?

I went with an architect friend to see the designs, and enjoyed the experience, which to me was novel and instructive. I do hope however, that very few of the competitors, the "also rans," saw the sad sight. Yet, perhaps if all had seen it, a means to avoid such waste might sooner be devised by a profession which certainly has brains.

I had never seen anything of this kind before and I will never forget my first impression as I entered the large hall. It made me take a gasp before diving into such a sea of sheets. Rows of forms, back to back, left bare room to walk round; forms with their backs to the walls, window ledges, and temporary rails between windows, gave three rows of sheets on some of the walls. Every available space including a platform with more forms and tables was needed, and the floor was convenient for loose labels, and other papers.

I knew something of the efforts of one competitor, and tried to comprehend the amount of mental energy wasted. I suppose one might estimate the cost of each set of sheets at £2 and I think there were about seventy sets. I asked my friend if some scheme of preliminary competition, asking for plan sketches, and position on site, might not have saved all this waste, reducing the final competition to about a dozen competitors or less.

The profession has no need of a layman's suggestions, but I cannot find words to express that first gasp as I first beheld the scene of human tragedy—of "Ships that pass in the Night."

E. S.

R.I.B.A Council Election.

The last day for receiving voting papers in this election is May 24.

UNITY AND REGISTRATION

Mr. Frank H. Heaven, A.R.I.B.A., writes: The question of "unification" as presented to the members of the R.I.B.A. and Society of Architects, with a recommendation of the councils of both bodies for acceptance is now "amalgamation," and not "unification"—quite different objectives—identical meaning "to reduce to unity or uniformity," whilst amalgamation means "to combine." Why the change of policy? The councils of both bodies appear to think so long as they agree, all will be well; what of the unattached architects? Are they to be part of the "mix," or are all to be "reduced" at a later stage?

A comparison of the number of architects in the country with the memberships of the R.I.B.A. and the S.A. will show that there is a vast majority outside of these bodies. Yet both councils tell us that their united (when amalgamated) will so impress Parliament that it will grant to them "protection" or "registration"—call it which is most palatable; but what will be the attitude of the unattached architects to this proposal. Will they meekly submit to be governed by the R.I.B.A. without representation; and if they, too, be admitted into the Institute on what terms to the present proposals? In my opinion, the ultimate end of the present movement—if it is to remain at "amalgamation"—is to invite defeat from outside, to destroy the labours of forty years of the S.A. (the independent body pledged to registration), and to lose the present acknowledged status of the R.I.B.A., and, further, to encourage disunity and dissension in the ranks of both bodies.

Other societies in the past have desired registration, but have either failed to obtain it after application to Parliament, or have profited by the experience of others and abandoned the attempt. I allude to the Chartered Accountants, the Surveyors' Institution, the Institute of Civil Engineers, and the Worshipful Company of Plumbers. Except for the last, who obtained registration many years ago, no doubt through their very great influence in the House, no society has been successful except those directly connected with the health—the doctors, nurses, veterinary surgeons and dentists.

It is suggested that Mr. Shortt has at a late date to give an expression of opinion in favour of registration, but, in the light of all the facts, is it reasonable to suppose that architects are to be given special consideration? Is it not to "cry for the moon"? Prima facie, registration appears to be the object of the R.I.B.A. and the S.A. But Viewed with an unbiased mind and in the light of past failures, one is inclined to think the kudos (excuse slang) or perhaps the archy is uppermost.

True, the S.A. members lose their individuality but gain *locus standi*, and in so doing admit defeat in the pursuance of an original objective and give colour to probable future continued effort in the same direction as if amalgamated.

Further, if it is so desirable that the S.A. should be incorporated with the R.I.B.A. before registration, surely it is equally desirable and more reasonable that the R.I.B.A. should grant similar terms to all the members of its own allied societies. This is not attempted and a sufficient reason should be forthcoming from the Institute for the neglect of its own *protégé*.

Now, a word to the Associates of the R.I.B.A. At the present moment the Associates are "masters of the house," but after "amalgamation" on the terms now proposed it will not be so, because the Associate class will be a minority within the Institute, and for this reason one is not surprised that Fellows and Licentiates are being urged to support the project, as by so doing they advance their own positions to one of authority within the Institute at the expense of the examined class. Associates should therefore give this careful thought, and act as they think best when voting at the forthcoming elections, which, in their own interests, the interests of the Institute, and eventually the interest of the whole profession, will be against the present proposals for amalgamation.

[*** Taking the points in order in Mr. Heaven's letter, we think everyone knows what is meant by the words he quotes. In reply to his second paragraph, the R.I.B.A., the Society of Architects and the allied societies which are solidly with the R.I.B.A. in this matter, form a "vast majority" of the bona-fide architects of the country. There is no reason to fear opposition from the "unattached architects." They have much to gain and nothing to lose by registration. Their interests must, of course, be protected in any Registration Act, but as we understand the position, there is no question of admitting them into the R.I.B.A., and no need to do so. The movement for the statutory registration of the unregistered professions is stronger now than it has ever been before. Architects have obtained registration in the United States, Dominions, and elsewhere, and their success is a good augury for this country. We are entitled to think that Mr. Shortt's opinion really carries more weight on a Parliamentary question than Mr. Heaven's. As to Mr. Heaven's sixth paragraph, if the scheme goes through the Society of Architects can rightly congratulate themselves on having contributed to the most practical and hopeful Registration scheme that has ever been put forward. The Society can sing "Nunc Dimittis" with a cheerful mind. The admittance of the members of the allied societies into the R.I.B.A. is not necessary. They are almost a unit in support of the R.I.B.A. scheme, and their interests will be fully protected in the Act. They are an integral part already of the R.I.B.A. organisation so far as an appeal to Parliament is concerned, and there is not the slightest necessity for any change in their status. It is the independent status of the Society of Architects that makes the scheme necessary. The last paragraph of our correspondent's letter is not, we believe, in accordance with fact. Under the scheme the "examined" members of the R.I.B.A. will, we believe, continue to be in a majority.—Ed.]

R.A. Exhibition.

Cavalry Memorial. Mr. Adrian Jones, M.V.O., F.R.B.S., Sculptor.

[The setting for this memorial was designed by Sir John Burnet, A.R.A., & Partners.]

SCULPTURE AT THE ROYAL ACADEMY

RIGHTLY or wrongly, the annual exhibition at the Royal Academy is regarded as a reflection of contemporary thought and achievement in sculpture. For this reason it has an importance possessed by no other exhibition.

Viewed from such a standpoint the increased space allotted to sculpture by the addition of Gallery No. VI, and many small groups and busts placed in other galleries, shows that there is in England an increasing interest in the plastic art. This is an inspiring thought. It is something that is of great interest to the public, to artists and to architects, for most architects regard sculpture as the crowning enrichment of building. Sculpture has so much to tell: it can tell its story with such great effect, that all must welcome the fact, if fact it be, that the plastic art is gaining yearly in importance.

Even, however, with this advance in the space available for its display at the Royal Academy, the conditions are far from ideal. Life-size or heroic figures, intended for the open air with architectural surroundings, seem disproportionate or even clumsy when placed in a covered gallery of medium height. In Paris the Salon sculpture has an immense advantage because of its display under practically open-air conditions. Once or twice large groups have been exhibited in the Courtyard at Burlington House. This scheme might be capable of considerable extension, and groups might be placed there more frequently with advantage to all concerned.

What is the impression of "Sculpture in 1924" which the Royal Academy gives? Perhaps lack of imagination is the most salient characteristic. There are some works, to be noted later, which do not call for this comment, but, considered in bulk, the sculpture does not indicate high achievement or striking originality. These qualities are not the fault of lack of recognition by the public, or lack of facilities for display by the Hanging Committee, but of lack of real ability on the part of sculptors. Until sculptors, as a whole, achieve something upon a higher level than that of much of the present work, there can be no enthusiastic interest upon the part of the public. It may not be too much to say that no one is interested in a great part of the array of khaki-clad figures ranged around the central hall. Many of the smaller works in other rooms similarly lack any real distinction. This is not to say that the 1924 Sculpture Exhibition is below the level of former ye —it is probably higher.

On the other hand, there are some m who are travelling upon the difficult ward path that leads to great achieveme Serjeant Jagger is almost the only art who has produced striking and origi figures of soldiers, and his exhibit this y from the Royal Artillery Memorial ma tains the tradition he has created. Th is, perhaps, a danger that this type figure, good as it is, will become a m nerism, and the artist is too good to lost in a "type," however good that ty may be.

Among the younger men who are p ducing fine work must also be mentio Gilbert Ledward, who exhibits a rel from the Blackpool War Memorial. composition, although not perhaps qu so striking as some of his previous wo it yet shows a very high level of achie ment.

Head.
MR. CHARLES WHEELER, Sculptor.

arles Wheeler has introduced an al- archaic element into his exhibits. At moment the result, although fascina-, has a stiffness which is not quite eflection of modern thought. When stiffness is subordinated as in "The nt Christ"—which has a wonderful ng of religious mysticism—the sculp- shows promise of some most fascina- work.

mongst the coming men must also be ıded R. R. Goulden, who exhibits a roup for a Memorial Garden." This ı work where carefully studied line, ıtiful modelling, and a certain feeling nspiration raise the work to a high l. Gilbert Bayes appears in satirical with "The World We Live In," a e figure touching a bubble. There is rnical head, and a very fine torso, good dling of limbs, vigorous treatment of

"The World We Live In."
Mr. Gilbert Bayes, Sculptor.

"Faun": Study for a Garden Terminal.
Mr. F. Doyle Jones, A.R.B.S., Sculptor.

the various planes and details. One of these days Gilbert Bayes will produce an unmistakable "Group of the Year." Reid Dick maintains his position with some beautiful work which cannot fail to be attractive.

Of the remaining works, special mention must be made of a kneeling figure by Derwent Wood, broadly treated with simple drapery and a fine head. "The Spirit of Sleep," by C. W. Dyson-Smith, is a recumbent nude well modelled and attractive, the position perhaps somewhat difficult as regards display, but nevertheless quite an interesting piece of work.

"A Snarling Panther," by Ethel M. Henderson, is a fine animal with bold, well-modelled surfaces and vigorous handling of detail. "Virtus et Spes," a relief by Ernest Webb, is well composed and handled with a sharply defined low relief which is very attractive. Ernest Webb comes from Nottingham, where a very fine school of sculpture seems to be developing.

Two interesting busts, one in stone and one in bronze, of "An Athlete" and "The Boxer," while unlike in detail, yet are not dissimilar in effect. The former is in stone and by Edgar S. Frith, the latter in bronze, by Alfred F. Hardiman. "The Wanderers," by Bertram Pegram, is a group of two figures well handled in the modelling but failing to portray the subject by any direct appeal.

Mention must also be made of a good nude by David Evans, which as a study is most attractive, but which lacks inspiration. A decorative group of considerable possibilities, by Ferdinand V. Blundstone, is called "The Captive." It shows a number of figures carrying a woman shoulder high upon a barbaric stretcher. The grouping is very decorative, but the woman captive hardly maintains the importance needed by her position as the focal point of the composition. Leonard Merrifield shows a nude study which is sound. John Angel exhibits a fine head from the Bridgwater War Memorial.

Altogether an interesting exhibition, without perhaps any really striking works.

NEW PAINTINGS AT THE NATIONAL GALLERY.

During the next few weeks the public will have the opportunity of seeing at the National Gallery two pictures which have been acquired for the National Gallery of Canada. Sir Antonio Mor is represented by a three-quarter length portrait—considered to be the famous Sir Thomas Gresham, which has been placed in Room XIV, near the famous Rubens called "Chapeau de Poil." In the great Venetian Room, No. VII, hangs a fine male portrait by G. B. Moroni, which will also be a valuable addition to the Ottawa Gallery. In Room XXI there is a brilliant example, "Princess Ragotsky with a Negro Page," of the art of Largillière, who was not hitherto represented at Trafalgar-square. The portrait must have been painted while the Princess and her famous husband were in France, between 1713 and 1717. A group of interesting early Italian and Flemish pictures has been presented to the Gallery by Mr. Henry Wagner, F.S.A. These, it is hoped, will be available for exhibition towards the end of the month, together wi h the fine altarpiece by Francesco Zaganelli (da Cotignola).

"Fear."
Mr. S. W. Ward Willis, R.B.S., Sculptor.

Mr. J. A. Gotch (President) occupied the chair on Monday at 9, Conduit-street, W., at an ordinary meeting of the Institute.

Mr. A. Keen (Hon. Secretary) announced the decease of the following members:—Colonel Cecil Locke Wilson, elected a Fellow in 1906. Colonel Wilson was a Past President of the South Wales Institute of Architects, and represented that body on the R.I.B.A. Council during the session 1911-12. Mr. George Harry Barrowcliff, elected Licentiate 1910. It was agreed that the regrets of the Institute be entered on the minutes and a message of sympathy be conveyed to the relatives.

The Scheme for a Thames Embankment after the Great Fire of London.

Mr. Sydney Perks then gave an address on The Scheme for a Thames Embankment after the Great Fire of London, in the course of which he said:

Wren showed a wide quay on both his plans, the quay being wider and more important on his first plan, which provided for filling in Dowgate Dock. The proposal to make a quay had been referred to as an example of Wren's great genius, but it was a fairly obvious idea; Hooke proposed a quay and also the abolition of all docks, so as to make a wide and uninterrupted thoroughfare from the Fleet to the Tower. Evelyn's second plan also showed a quay 80 ft. wide, and the filling in of Dowgate Dock, so Wren must not get all the credit for proposing a quay, presuming they considered it a good idea. It was well to note that a public quay or embankment as shown on the plans of Evelyn and Hooke formed a thoroughfare by the river with no street immediately at the rear, but Wren's plan and the proposed quay according to the Acts of Parliament showed a quay with a thoroughfare only slightly farther north; they had Thames-street, a direct line east and west, and the quayside, according to the Acts of 1667 and 1670, would not have been wanted as it was only a few yards farther south. Two Acts of Parliament were passed, and they stated a quay 40 ft. wide was to be made; shortly, the generally accepted view of to-day was that a magnificent quay 40 ft. wide was made at public expense, the money being provided by the coal dues; this quay had been compared with the present Thames Embankment, and it had been stated that the Corporation of the City of London, after paying for the quay with public funds, allowed people to build over public property until in about 100 years it practically disappeared, and finally that the Corporation went to Parliament in 1821 and obtained an Act repealing certain sections of the old Acts.

After an interesting survey of the Acts of Parliament involved, the lecturer dealt with a document, which he considered very important, dated December 4, 1671, and entitled "Letters Patents confirming the Design for making an open Wharfe forty feet wide on the North side of the River Thames between London Bridge and the Temple and directing that no Buildings should be erected within that distance from the River." He had reason to believe that this document had never been made public; it was signed "By Writt of Privy Seal—Pigott," and had the great seal. It referred to the Act of 1670, stating "a Key or Public and open Wharfe" had to be formed, and buildings set back 40 feet from the river front, and that "Bounds of each Proprietors Ground . . . should be distinguished by Denter Stones to be placed in the pavement" and that the line of the whole Key or Wharfe should be it ascertained by Direction of the Lord Mayor, etc., referred to cranes, etc., to be allowed within the 40 feet, and that a plan had to be submitted by the 20th Day of June following the passing of the Act. It stated the Corporation had "presented to us a model form or Draught of the said Key . . . so designed and appointed to be made" and the plan was annexed. The letters patents also decided that "our Ground and Soil . . . may be taken out of our said River of Thames . . . to make the said Line between London Bridge and the Temple . . . uniform and regular . . . according to the said Modell fform and Draught . . . annexed," the said soil to become the property of the Corporation except between Paul's Wharf and Baynard's Castle. The whole document was exceedingly interesting, but perhaps the most interesting part was a plan of the frontage of the Thames from London Bridge to the Temple made in 1671; it was over 8 ft. long, the scale was 50 ft. to the inch: it was submitted to Dr. Wren in draft in May, 1671.

It did not agree with the Ogilby and Morgan map, and a comparison was very interesting, for Ogilby and Morgan showed the suggested quay according to the letters patents was not constructed. The river frontage and steps as they existed were clearly shown on the plan, and also the proposed frontage encroaching on the river and new landing steps. He had applied the line to the present Ordnance map, a little adjustment was necessary with regard to the bend of the river, but the plan fitted in very well, and must have been carefully measured: the plan and document were worth careful study, and a typewritten copy of the latter and a facsimile of the plan would be deposited in their library. To make the quay as designed considerable encroachment on to the river must have been made. The contractor for the Fleet Ditch for a length of over 200 ft. was paid over £51,000, so they saw at once the cost of the Thames Embankment scheme would have been colossal; no payment was recorded for purchasing property in connection with the scheme, or for making the quay, but several items of expenditure were recorded for improving the docks and quay adjoining, as provided in the Act of 1670. The entries in the minutes of the City Lands Committee, etc., indicated the improvements contemplated were national rather than merely local; the King was the final authority and not the Corporation; there were frequent references to Dr. Wren, or "Mr. Surveyor general." The City Surveyors were instructed to discuss their ideas for the line of quay with Dr. Wren and satisfy him before submitting the plan to His Majesty. Questions concerning the erection of buildings within 40 ft. of the river were not dealt with by the Corporation; they were delayed in order to ascertain His Majesty's decision. Dr. Wren, His Majesty's Surveyor, prepared the Fleet Ditch scheme. Dr. Wren applied to the King with reference to "an alleged encroachment on the 40 ft. wharf or space" by the Fishmongers' Company. The Court of Aldermen having received a petition for payment for land within the 40 ft. boundary "did not think it convenient to interfere in the matter," but promised to assist the applicant to petition His Majesty; and so on.

The Corporation acted with the greatest care in the matter, for they had seen that in January, 1673, they consulted the Attorney General, in June, 1674, the Lord Mayor Recorder attended a Committee of the H of Lords, and in November, 1681, the Co troller and Recorder again advised "on whole matter," they evidently were not tain if they were liable for the land ta etc., and the Act was not very clear; whatever the opinion was, no one had paid up to June 19, 1678; there was a defi entry on that date, and he could find no e at a later date.

The maps subsequent to that of Ogilby Morgan showed encroachments on the s of 40 ft., but they had also seen that o plans and many views about the same dat slightly later did not show a clear space 40 ft. from the Temple to London Brid but apart from the question of fact, and c sidering the Act of 1670 and the docum referred to above, what an illogical and moral proposal it was.

Let them for a moment consider the sche for a quay. It could not have been wan by the owners of the warehouses, and it co not have been used as a thoroughfare, old maps showed that there were many sta for landing goods, and the quay would h been inconvenient even for local pedestr traffic, being encumbered with cranes, rop etc. Wren's idea was different: the wat front was to be used partly for the Halls City Companies, the character of the wh river front being altered. But under the of 1670, and as stated in the document had submitted, it was clearly intended t buildings facing the river should be of t warehouse class; that being so, it was c viously a bad arrangement to erect wa houses 40 ft. from the river and so increa enormously the labour of loading and unloa ing barges. The proper place for a wa house was flush with the water line.

In conclusion, the lecturer said he did n pretend to have solved the mystery concer ing the quay, but he hoped he had been a to add some information on the subject; a he submitted for their consideration the fa that the quay as defined in the letters pater was never built; also that it was very doub ful if a clear space of 40 ft. was ever form from the water line, for the whole length the river frontage; and lastly that the C poration acted throughout in a fair and pr per spirit, bearing in mind the best interes of the citizens at the end of the seventeen century, just as they always did, and to-day.

Dr. Philip Norman, in proposing a vote thanks to the lecturer, said they owed him debt of gratitude for the work he had don both as a writer and architect, in preservi Old London. What specially interested h in the paper they had just heard was the 8 plan. With regard to the illustrations th had seen he had never been able to get a cle idea as to the accuracy of the streets, or of su details as the 40 ft. quay. He could not he thinking in the maps shown there were op spaces along the river front. A surprisi amount of information had been obtaine and, in his opinion, an honest but not su cessful attempt had been made to make quay.

Mr. Delissa Joseph, in seconding the vote thanks, said the part of the paper which a pealed to him individually was the part whi dealt with the contemporary life of the tim

Mr. W. L. Davidge said the work of t lecturer necessitated going to the City archiv themselves. They must have co-operation b tween the Government and the municip authorities. He considered the public, throu lack of care, lost the public quay which th had had, wholly or in part, for 100 years. showed the necessity of keeping a close wat on those things which they had in the w of improvements. It was absolutely necessa not only to have a fine plan, but a consiste public opinion to keep that plan in workin order.

ILLUSTRATIONS

Our inset illustrations this week are all exhibits at the Royal Academy Exhibition.

Record Office for the Bank of England.

There exists on the site a one-story building with northern light roof, the walls of which are to be retained, windows cut in them, floors introduced, and the whole structure raised to a height about 65 ft. from pavement level. The interior construction is of steel, with ferro-concrete to floors and staircase. The chimney that shows on the drawing is an existing one, larger than would have been necessary for the present building. Advantage, however, is taken of the fact to use it for the combined purpose of serving not only the heating apparatus and the destructor, but also for ventilation of the basement. The setting back of the upper stories has been done to avoid interference with adjacent lights. Acceptance of this governing factor is indeed the theme on which the design for this frontage is based.

The existing building is faced with London stock bricks, and these will be used throughout for the facing of the higher building. The windows with arched heads are formed on precast permanent centerings of concrete, thus combining the strength of the arch and the convenience of a flat lintel.

Messrs. Holloway Bros. are the contractors for the general building work; Messrs. Matthew Shaw & Co. are supplying the steelwork; Messrs. Stuart's Granolithic Co. the floor and other ferro-concrete work.

Mr. F. W. Troup, F.R.I.B.A., is the architect.

Midland Bank, Darlington.

The premises of the Midland Bank in Prospect-place, Darlington, are being entirely reconstructed. The banking hall, which is large and well lighted, covers an area of about 2,000 square ft., and is about 26 ft. in height. It provides accommodation for a staff of about forty. The usual strong rooms, cloak rooms and lavatories for male and female staff are also included in the accommodation which will be provided. With the exception of certain store rooms and lavatories on an upper floor, the building is of one story, the whole occupied by the bank.

The site is a fine one, at the junction of Prospect-place and Northgate, and the frontage line towards the latter street has been set back, and the salient angle splayed off in order to relieve vehicular traffic at a crowded and congested corner. The exterior will be faced with Portland stone raised above a base of polished dark-grey Aberdeen granite, and the roof will be covered with green Westmorland slates. The whole of the floors and roofs will be fire-resisting, and constructed of concrete reinforced with steel fabric supplied by the British Reinforced Concrete Co.

The general contractor is Mr. Thomas Lumsden, of Grantham-road, Newcastle-on-Tyne, and the following sub-contractors will be employed: Messrs. Scott & Sons, Newcastle, plumber's work; Messrs. Dawber, Townsley & Co., Darlington, slater's work; Messrs. Garden & Co., Aberdeen, granite work; Messrs. Concrete, Ltd., Leeds, artificial stone; Messrs. Thomas Faldo & Co., London, asphalting.

The architects are Messrs. Brierley & Rutherford, of 13, Lendal, York.

Additions to Farrington's Girls' School.

The buildings will consist of three blocks, with low connecting corridors. The first block, or East House, was completed in 1911, from designs by the late Mr. Charles Mileham, in collaboration with Messrs. Gunton & Gunton, who were also appointed honorary consulting architects in connection with the completion of the scheme.

The present additions comprise an assembly hall, with cloak rooms and retiring rooms, and over these, rooms for singing and music practice. Adjoining the hall are class rooms, science, art and mistresses' rooms, &c., arranged round a two-storied hall with galleries, and lighted by a clerestory and glass dome.

The third block, or West House, contains additional dormitories and bedrooms for girls and staff, common room and changing room, library, dining hall, with the necessary kitchens and offices. The buildings are designed to accommodate about 100 girls, with teaching and domestic staffs.

The general contractors are Messrs. G. E. Wallis & Sons, Ltd., of Maidstone, and the sub contractors are as follows: Messrs. Matthew T Shaw & Co., Millwall, E.14, structural steelwork; Messrs. Crittall Manufacturing Co., metal casements and lead lights; Messrs. Stirling & Johnson, roof tiling; Messrs. H. J. Cash & Co., heating and hot-water supply.

The work is now being carried out from the designs and under the superintendence of Messrs. Crickmer & Foxley, architects.

House at Hampstead Garden Suburb.

The unusual shape of the plan of this house was dictated by the fact that the building area was limited to a rectangle of about 50 ft. by 70 ft., and building lines on both the north-west and south-west sides were tied. The position of the drawing-room was dictated by extensive views down a narrow strip of garden leading to the Heath. The house is occupied by three persons having important work and living somewhat independent lives; for this reason there are three sitting-rooms in addition to the dining-room. The bedrooms are all on one floor, and open off a rectangular landing 8 ft. by 20 ft. No difference has been made in those rooms which are occupied by the staff.

The materials used are sand-faced bricks with artificial stone dressings, and a hand-made plain tile roof. The front doorway has a white surround and pilasters of wood, and a metal fanlight. The contractors for the house were Messrs. Guild Housing, Ltd., who also carried out a great many fitments in British Columbia pine, treated with "Dry-tone" process. The only sub-contractors were Messrs. Wontner-Smith, Gray & Co., who did the heating and hot-water work. The following firms supplied materials:—Messrs. Thomas Lawrence, Ltd., facing bricks; Messrs. H. F. Warner, Ltd., tiles; Messrs. Thomas Elsley, Ltd., fanlights; Empire Stone Co., Ltd., artificial stone; Messrs. James Gibbons, Ltd., ironmongery; North British Rubber Co., Ltd., rubber carpeting in the hall.

The house was completed at the end of last year, and cost, with fences and some garden work, a little under £4,000.

Our illustration is from the exhibit in this year's R.A. Exhibition. Messrs. C. Murray Hennell, F.S.I., and C. H. James, A.R.I.B.A., are the architects.

Lower Chapel, Eton.

Mr. Walter Tapper, F.R.I.B.A., is the architect of the Lower Chapel, Eton. The woodwork was carried out by Mr. L. A. Turner, of Lamb's Conduit-street. The tapestry panels, of which there are four, and which depict the life of St. George, are being carried out by Messrs. Morris & Co., of Hanover-square, from cartoons prepared by the Hon. Mrs. Akers-Douglas. Our illustration is from the exhibit at the Royal Academy Exhibition.

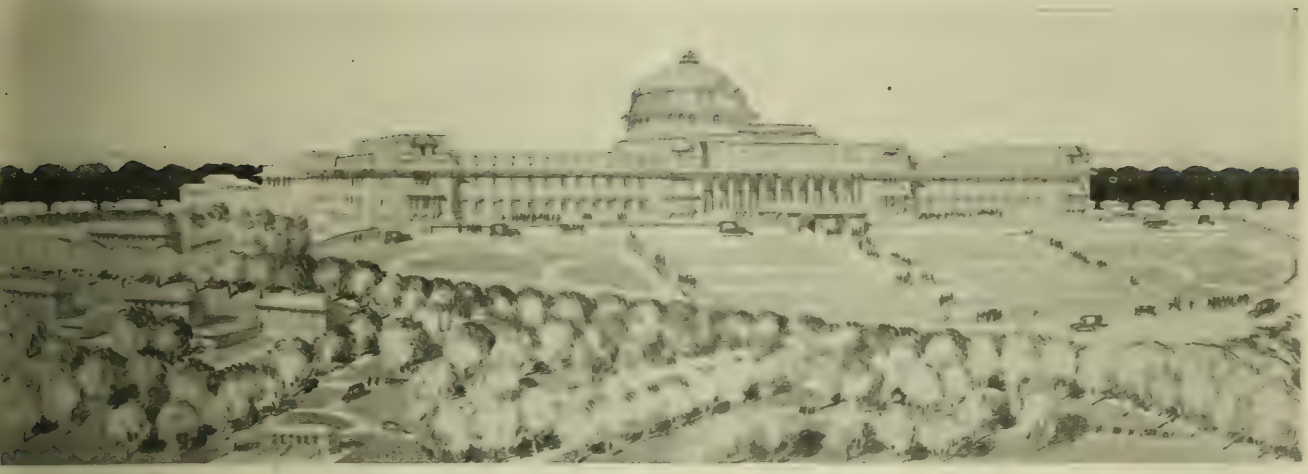
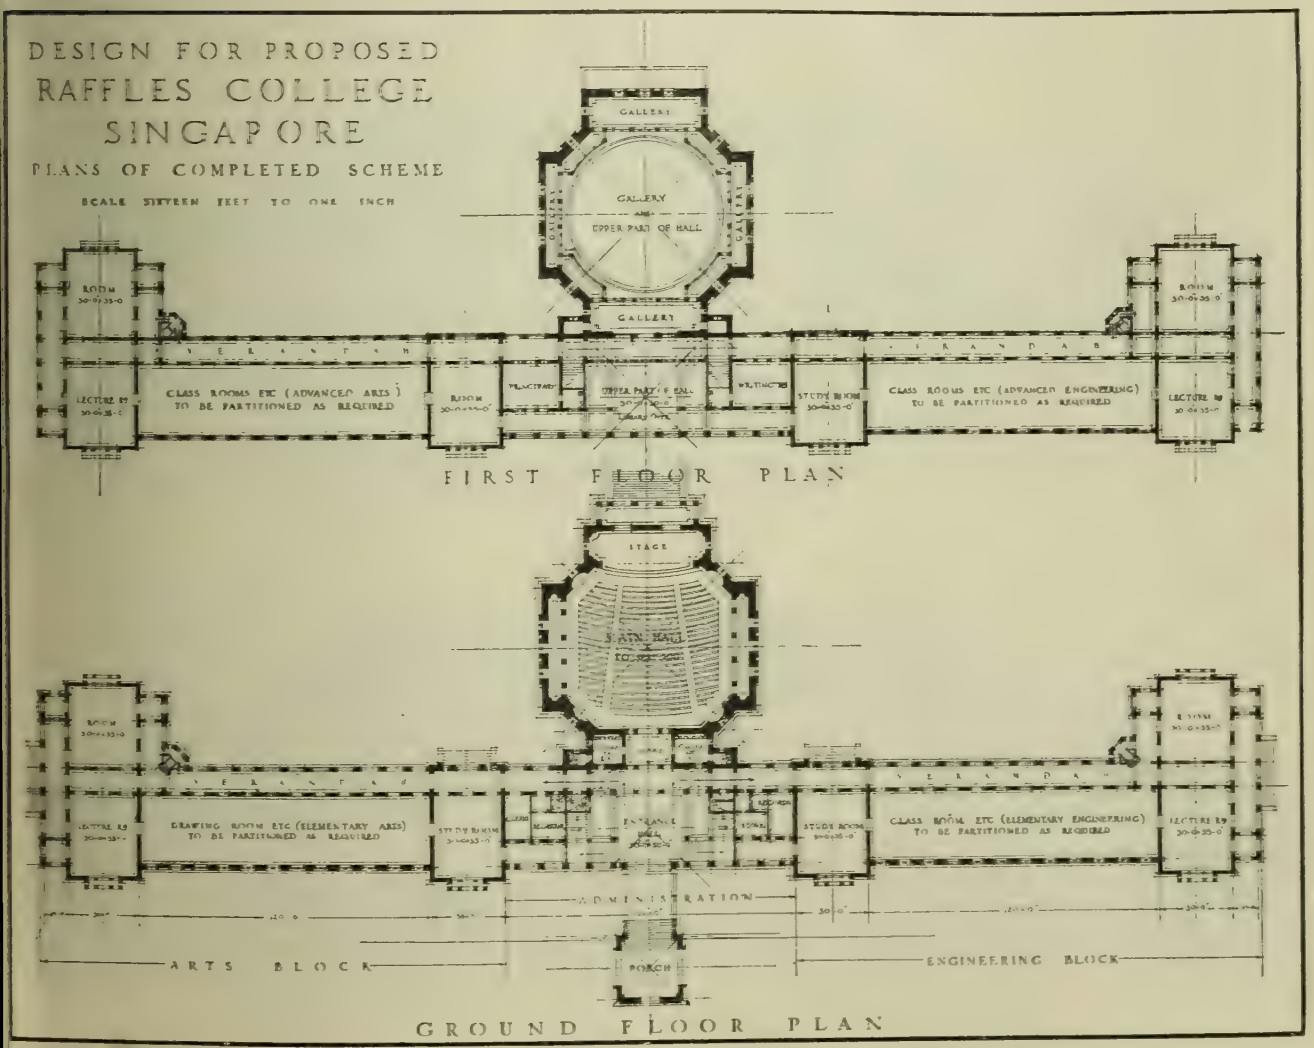
Design for Congregational Church and School, Bellingham. MESSRS. H. F. MURRELL & R. M. PIGOTT, AA.R.I.B.A., Architects.

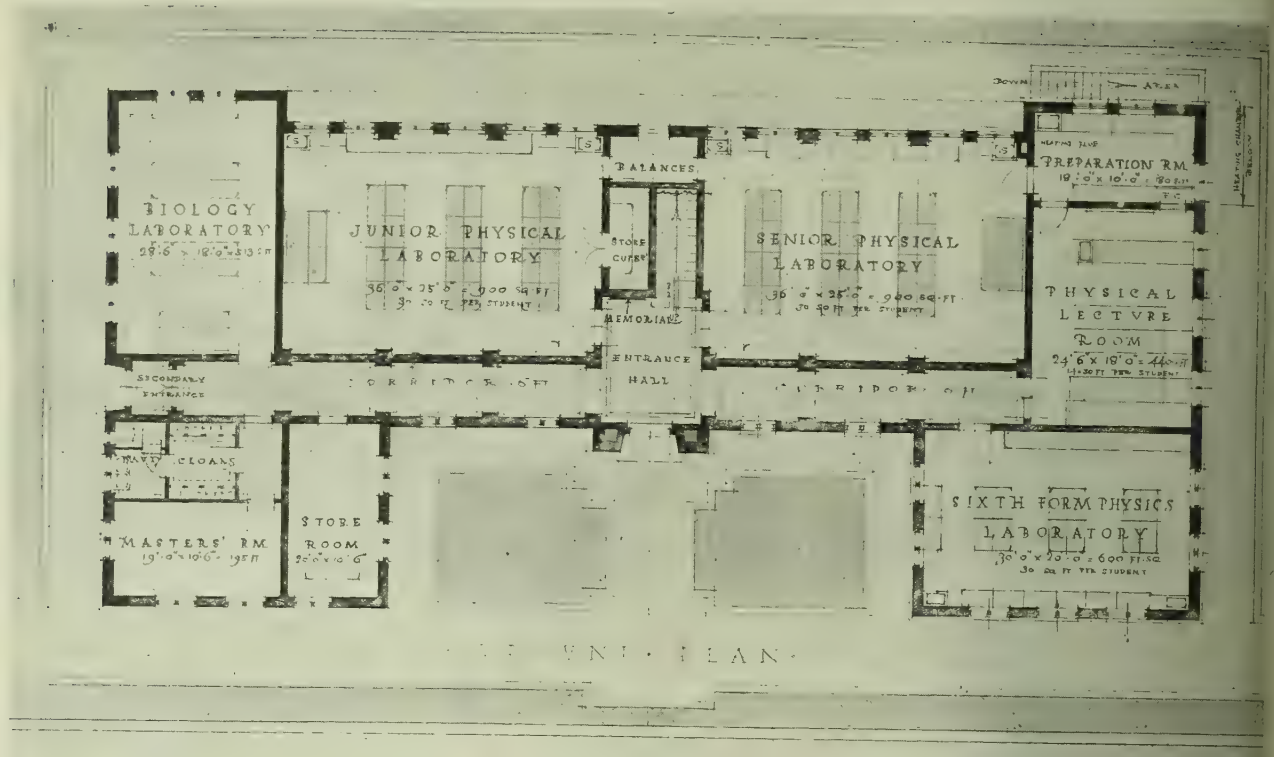
[This was one of the designs submitted in a recent limited competition for a Congregational Church at the new L.C.C. housing scheme at Bellingham. The accommodation asked for consisted of a church to seat some 500 persons, with the usual vestries, &c., with a Sunday school hall and church parlour adjoining. The materials proposed to be used were Luton stock bricks and stone dressings to windows, red tiles on roofs, and lead coverings to the fleches. This design was submitted by Messrs. H. F. Murrell & R. M. Pigott, AA.R.I.B.A., of 35, Bedford-row, W.C.1.]



New Gates at King's College, Cambridge. Designed and made by Mr. A. W. Elwood, M.I.S.I.



[These wrought-iron gates, closing the back entrance of King's College, Cambridge, are the gift of Sir Charles Walston and Lady Walston, and are from the designs of Mr. A. W. Elwood, of Denmark-road, S.E., who was placed first in competition with thirty others. The gates are influenced by the work of Tijou. In the panel above the centre pair are the arms of the Royal founder, Henry VI, and on the gates below are a crowned Tudor rose on one side and a crowned portcullis on the other.]



Raffles College, Singapore, Competition. Design submitted by Messrs. S. Woods Hill & E. C. Henriques, AA.R.I.B.A.

[Bracketed equal with the design of Mr. E. Vincent Harris for second and third premiums. The first premiated design, by Mr. Cyril A. Farey and Mr. G. R. Dawbarn, was given in our issue for January 25, 1924.]

Raffles College, Singapore, Competition. Design submitted by Messrs. S. Woods Hill & E. C. Henriques. (*See p.* 834.)

Taunton School Competition.

Design submitted by Messrs. Gordon G. H. Holt & Verner O. Rees.

[This design was commended in the recent competition. The accepted design, by Mr. E. Vincent Harris, F.R.I.B.A., was given in our issue for January 4 last.]

HE ISOLATION BLOCK T THE LONDON FEVER HOSPITAL

HIS building, to which reference was made recent issue of *The Builder*, was erected in 1-15. It comprises two stories, the ground being planned on the lines of the Pasteur pital, Paris, the upper floor containing eight ate wards for paying patients.

he ground floor, of which a plan is given, is ded in the centre by the ward kitchen on north, and the entrance with discharging ns and nurses' dressing room on the south, two groups of six small wards; one group male, the other for female patients.

he partitions between the wards and the idors are of plate glass in teak frames; idea being that each group of six wards ns one ward, and can be supervised from the s windows in the ward kitchen. Each d has two doors, one opening on to the idor, the other on to the open balcony ch extends along the whole of the outer s of the building. While, therefore, the ents are as much within the purview of the se as if they were in one room, each ward o cut off from the adjoining one that it is ible with proper precautions to treat separate distinct diseases in each without fear of ction passing from one ward to another. ach ward is a lavatory basin supplied with and cold water and waste, so that both ors and nurses can wash their hands after nding to the patient before passing to the ward. In each ward are hung overalls the doctors and the nurses, which are put before attending to the patient, and left in ward after the visit is over.

addition to the lavatory basin there is in ward a sink also provided with hot and supplies and waste. The use of which is mpty and fill the portable bath.

he wards are warmed by means of hot water ators served by a steam calorifier in the ment, and ventilation is provided by an ust trunk, one for each ward, opening into orizontal trunk of which there are twelve, to each ward, formed in a space between first floor and a false ceiling to the ground corridor. These trunks are connected two vertical shafts which are carried up ugh the upper ward kitchen into a main t in the roof which is provided with an ust fan. The measured effect of this arrangement is that the air in each ward can be completely renewed between four and five times in the hour. Besides the doors from the wards on to the balconies the ward kitchen is also provided with a door so that in case of need any ward can be entirely served from the outside.

The experience of the Pasteur Hospital proves that with due care diseases such as smallpox, scarlatina, diphtheria, measles, and erysipelas can be treated in adjoining wards without fear of cross-infection.

BOOK REVIEWS

An Itinerary of the English Cathedrals for the Use of Travellers. Compiled by JAMES G. GILCHRIST, A.M., M.D. (University of Iowa, U.S.A.); revised and edited with an Introduction on Cathedral Architecture by the REV. T. PERKINS, M.A., F.R.A.S., Rector of Turnworth, Blandford. With forty-two illustrations, a map, and thirty-six plans. (London: G. Bell & Sons, Ltd., 1923.) New edition, revised and enlarged.

"This little book," the Preface states, "as originally written by Dr. Gilchrist, was intended especially for visitors from the United States; but, as it seemed likely to be equally useful as a companion to the Cathedral Handbooks, it was revised and somewhat amplified by the late Mr. T. Perkins, who was already known as a writer on architecture." The book actually takes its place in the well-known series of Bell's "Cathedral Handbooks" as introduction to the rest, since it deals with the cathedrals of England in general, just as they describe each several one in detail. A map on the last page shows how the different cathedrals can be visited in turn without undue retracing of steps, and fortunate indeed are they who have leisure to make the circuit, for the inspection of many cathedrals is an education in the art of appreciating any particular one. The treatment is concise in the extreme; twenty pages are allotted to an introduction on "Cathedral Architecture," and then each cathedral in turn is dealt with in two or three pages divided between text and illustration, a view and a plan being inserted for each building. Even American tourists would probably find this too brief, for though they like to rush around a country and see the utmost possible for the expense of a certain amount of time and money, they enjoy absorbing a multitude of facts from the guide book in advance in order to prepare themselves to make the most of their opportunities when placed face to face with the monument. But this detailed information is already available in the other volumes of the series, and the "Itinerary" serves its purpose if the intending tourist in looking through its pages can obtain such a general idea of the buildings mentioned as will permit him to make up his mind as to which one he is most anxious to visit. There can be no doubt that the book performs this function to admiration.

The Housing Problem, and the Way Out. With Notes on Unemployment. (The Brotherhood Movement (Incorp.), 37, Norfolk-street, Strand, W.C.) Price 6d.

This pamphlet deals with the housing problem from the standpoint of the duty of the citizen in a Christian country, and it also examines various proposals for absorbing unemployment in useful undertakings, such as the erection of houses from materials now regarded as "waste products." We hope that the author is unduly pessimistic in suggesting (on p. 40) that the distribution of honours, on the lines of the O.B.E., is desirable to stimulate in our citizens a sense of self-sacrifice in helping forward the housing movement. It may be true that it is the hope of reward that sweetens labour, but we doubt that the anticipation of cheap honours would produce the kind of self-sacrifice we all wish to see. The pamphlet includes some type plans designed to secure the Government grant, and these would have been of greater value if they had been accompanied by carefully designed elevations, since these are no less important than the plans and are far more often deplorably bad. The pamphlet contains a mass of useful information concerning the housing shortage and possible remedies, and it emphasises the fact that an awakened public conscience alone can find the way out of an apparently hopeless situation.

LONDON FEVER HOSPITAL ISOLATION BLOCK.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS

We take the following notes from the minutes of the Council meeting held on May 5 :—

Architectural Scholarship at Oxford and Cambridge Universities.—On the recommendation of the Board of Architectural Education, it was decided to offer to the Universities of Oxford and Cambridge (in alternate years), on behalf of the R.I.B.A., an annual scholarship for the advancement of the study of the art of architecture within these universities in schools recognised by the university authorities and the R.I.B.A. as qualfying for the Degrees of the universities and for exemption from the examinations of the R.I.B.A. respectively.

Special Examination.—It was decided to allow candidates for the special examination to take the examination in two parts, as in the case of the Final examination.

International Competitions.—It was decided to take up the question of International Competitions with a view to the revision of the existing regulations for these competitions.

The R.I.B.A. and the Society of Architects.—It was reported to the Council that, in the poll of Licentiates on the subject of the Council's proposals for the registration and consolidation of the profession, some 98 per cent of the Licentiates who had voted had expressed themselves in entire agreement with the Council's proposals.

The Architects' and Surveyors' Assistants' Professional Union.—The Council unanimously approved the report of the Committee which has recently conferred with the representatives of the Architects' and Surveyors' Assistants' Professional Union, and which recommended that steps be taken to secure the representation of the Architectural Group of the A.S.A.P.U. on the R.I.B.A. Council, that joint inquiries be held on the subjects of the overcrowding of the profession and the establishment of a minimum wage for assistants, and that the Union should be given representation on the Registration Committee.

Reinstatement.—The following were reinstated: As Associates, Messrs. T. H. O. Collings and A. Wickham Jarviss; as Licentiate, Mr. Andrew G. Cole.

The Exhibition of Modern British Architecture (arranged by the R.I.B.A. and the Architecture Club) will be opened by the Earl of Crawford and Balcarres on Monday, May 26, at 3 p.m. in the Short Period Rooms, Palace of Arts, British Empire Exhibition, Wembley.

ARCHITECTS' AND SURVEYORS' ASSISTANTS' PROFESSIONAL UNION

The members of the metropolitan branch of this Union recently inspected the foundations of Messrs. John Barker & Co.'s new premises. The architect, Mr. Carbuche, explained that compensation for damage to adjoining structures was a necessary preliminary precaution to guard against in works of this size and nature: photographs taken at the commencement of the contract showed clearly the defects of neighbouring buildings. The depth of the foundations was approximately 40 ft., the subsoil consisting of clay and ballast, whilst a pressure of 5 ft. head of water was exerted. The retaining walls supporting a building at the rear of the site were peculiarly formed, and, combined with the floor, the outline was very similar to a ship's bottom. A hole was left at the base of the wall for the escape of water, which will subsequently be made good. Taking a section through the wall, there was the shuttering, breeze slab, concrete, and asphalte covering; and there would be 10 in. of concrete over the whole site. Mention was made of the L.C.C. regulations in connection with the staircase, which must be 1 ft. wide for every 1,000 ft. floor space.

SURVEYORS' INSTITUTION

The following candidates have satisfied the Examiners of the Surveyors' Institution :—

FINAL EXAMINATION, 1924.

Addie, A. L. Forrester, Manchester.
Allport, C. H., York.
Anderson, J. H., Gunnersbury.
Arnold, J. S., Canonbury.
Arundel, H. R., Highgate.
Ball, H. F., France.
Barron, J. R., Scunthorpe.
Bean, G. W., Bedford.
*Bedford, H. E. S., Essex.
†Bishop, W. T., Westminster.
Black, C. W., Putney Hill.
Blissett, F. C., Tooting.
Blowen, F. E. V., Newport.
Bowyer, C. P., Slough.
Browne, R. E. J., Wimbledon.
Burgess, S. H., Cheshire.
Bywaters, S. F., Maida Vale.
Caines, H. J., King's Cross.
Campbell, I. W. R., Guildford.
Chadwick, J. B., Derby.
Chamberlain, R. P., Leicester.
Chapman, H. A., Kingston-on-Thames.
Clare, J., Bedford.
Clark, A. E., Croydon.
Clogg, R. W., Hants.
Cook, J. O., Jun., Plumstead.
Cowell, A. E., Dorking.
Crown, R. J., Lee.
Davidson, A. J., Douglas.
Davies, D. P., Rhymney.
Dawney, P. W., Purley.
Daws, W. A., Reading.
Dawson, A. H. B., Sussex.
Denne, S. V., Kent.
Denton, A. S., Sheffield.
Dowling, R. B., Barnet.
Down, E. A., Wilts.
Esbester, E. H., Bristol
Exley-Fisher, T., Yorks.
Faddy, C. E., Wallsend-on-Tyne.
Farbridge, L. C., Kent.
Fowler, C. H., Sussex.
Fowler, T. H., Bath.
Frearson, T. B., Birmingham.
Gardner, G. G., Sussex.
Goldirg, A. C., Bexhill-on-Sea.
Gowing, C. G., Norfolk.
Grundy, F., Tyldesley.
Hagger, G. M. W., Greenwich.
Haines, R. J., Hereford.
Hawkins, W. V., Hammersmith.
Heather, J., Reigate.
Hedley, M. T., Sutton Coldfield.
Heynes, H., Manor Park.
Hogbin, L. M. T., Ramsgate.
Howe, R. N., Muswell Hill.
Humphery, W. O.,
Hunt, R. W. R., Luton.
Hyatt, M. P., Hounslow.
Jackson, R. V., Cambridge.
Jackson, W., Wimbledon.
Jeffries, P. E. R., Ipswich.
Jennings, W. A., Stratford.
Johnston, J. C., Leeds.
Joseland, L., Kidderminster.
Kennaugh, T. H., Douglas.
Kershaw, C., Halifax.
Keyte, J. R., Birmingham.
Knight, P. J. G., Kent.
Knowlton, J. A., Bristol.
Larkam, R. W., Salisbury.
Linington, F. J., Margate.
Llewellyn, E. G., Eastbourne.
McFie, B. J. S., Oxford.
Malkinson, B. W., King's Cross.
Maltby, H. V., Beckenham.
Maples, J. T., Oxton.
Matthews, A. C., Herts.
Matthews, H. J., Birmingham.
Maynard, G. E., East Putney.
Merry, W. H., Leighton Buzzard.
Miller, A. R. R. A., Spring Gardens.
Mills, J. R. M., Norwich.
Mitchell, J. H., East Grinstead.
Moore, C. C., Oakleigh Park.
Moore, J. J. M., Isle of Man.
Newcombe, R. J., Market Harborough.
Norrington, C. F., New Malden.
Palmer, G. B., Regent's Park.
Parrott, D. G., Bromley.
Peacock, R. M., Bedford.
Pepper, W., Yorks.
Pickup, J., Lancs.
Pidgeon, F. A., Sutton.
‡Pipe, A. W., Snaresbrook.
Prall, H. H., Rochester
Priest, B., Norfolk.
Proctor, J., Barry.
Recordon, D. B., Berkhamsted.
Richmond, H. I., Chester.
Ridgway, I., Northants
Rogers, F. I, Droxford.
Rose, R. C., Newbury.
Sadd, A. G., Swansea.
Sanders, S., London.
Sawbridge, D., Wigan.
Seabrook, E. C. London.
Slater, J. A., Lancs.
Stanford, F. E., Dorchester.
Story, J. A., Upminster.
Story, T. H., Upminster.
Stott, C. G., Wandsworth.
Tapping, R. E., Waddon.
Tebbutt, B. H., Rickmansworth.
Thomas, E. H., Aberfan.
Thomas, H. L., Swansea.
Wagstaff, F. A., Southcroydon.
Wakeford, R. P., Wimbledon.
Walmsley, J., Preston
Watney, H. D. A., Old Jewry.
§Weller, E. P., Wantage.
Whipp, J. R., Cheshire
Wilson, G. M. T. Herefordshire.
Wood, N. C., Otley.
Woollaston, T. W. Staffs.
Wright, A., Norwich.
Wrigley, R., Derbyshire.
Yorston, J. H., Manchester.

DIRECT FELLOWSHIP EXAMINATION, 1924.

Bridgewater, A. T., East Ham.
Fread, H. C., Esher.
Jenkins, W. R., London.
Powlett, A. T., West Derby.

SPECIAL EXAMINATION FOR DEGREE HOLDERS

Farid, A., Egypt.
Field, J. D., Surrey.
Fordham, C. M., Hampstead.
Kemsley, R. H., Theydon Bois.

SPECIAL SINGLE EXAMINATION, 1924.

Beak, F. W., London.
Carpenter, E. R., London.
Carpenter, G. L., Gillingham.
Davies, T. H., Enfield.
Dent, R. P., Leeds.
Holdsworth, A. P., Sheffield.
Leigh, P., Wakefield.
Peay, C. H., London
Robson, J. E. B. Dover.
White, E. C., London
Whiteley, F. D., Halifax.
Woollacott, H. S. Wood Green.

* Penfold Gold Medal and Wainwright Prize.
† Crawter Prize.
‡ Galsworthy Prize.
§ Mellersh Prize.

Scottish Examinations, 1924.

INTERMEDIATE (STUDENT).

Teviotdale, G. S., Glasgow.

INTERMEDIATE (NON-STUDENTS).

Boyd, A. M., Glasgow.
Davidson, M. O., Bridge of Weir.
Stewart, N. F., Lanarkshire.

FINAL.

Brown, J. V. R., Falkirk.
Davidson, J. (Jun.), Fifeshire.
Howie, J., Edinburgh.
Johnstone, R. W., Midlothian.
Malcolm, D. G., Glasgow.
Smith, T. R., Glasgow
White, J., Elgin.
Wood, D. McN., Glasgow.

DIRECT FELLOWSHIP.

Proctor, A. L., Forfarshire.

SPECIAL SINGLE.

Hood, J. P., Glasgow.
Inglis, A., Partick.

Irish Examinations.

INTERMEDIATE (NON-STUDENTS).

Flower, C., Dublin.
Ogilby, R., Belfast.

FINAL.

McAuley, B., Belfast.
McConnell, R. M. T. Belfast.
Tudor, C. W., Belfast.

LEEDS AND WEST YORKSHIRE ARCHITECTURAL SOCIETY.

At a general meeting of this Society recently a resolution was passed deciding unanimously to approve the action of the Royal Institute of British Architects in their proposal to incorporate the Society of Architects—thus securing a united Institute for the purpose of obtaining Registration of the profession.

THE ARCHITECTURAL ASSOCIATION AT THAXTED

A Brilliant Church Interior.

THAXTED, in Essex, was chosen for the first mmer visit of the "A. A." on May 10. The ty of about twenty-five members was joined Mr. Ivar Tengbom, President of the Society Swedish Architects, Mr. Carl Bergsten, Vice-sident, and Mr. and Mrs. Arvid Bjerke. xted is not a show place—we say this in gratulation—and the placid sensation pro-ed by the party was proof that the town s not exist to stage-manage turns for tourists, suffers them in quiet dignity. The party an invitation to visit Horham Hall, where owner, Mrs. Humphry, provided tea. The l is typically English, the exterior har-nious and solid, the interior an epitome of l English history for the last 400 years; erent periods, families, and tastes are all ceable, until the final Victorian phase when banqueting hall had its panels stripped to he the Houses of Parliament; the Jacobean usters painted over, frescoes and beams ered in, and Queen Elizabeth's shoe bartered America. Much original work remains, the house as it stands is a notable example the Tudor English home.

Thaxted village owes its general character to its two outstanding features, the Church l the Moot Hall, than to its good fortune in ing missed prosperity, and in standing by ile its old rival in steel and cutlery grew into dern Sheffield. At one time the town had n a centre of the steel industry but, as local od for fuel got used up, its importance lined, until, in 1685, its charter was forfeited, l the Corporation dissolved. During the l era Thaxted stood still, or dwindled still ther, and it was only just before the war t the friendly little train was connected with enham, and the distance from a station uced from seven miles. These facts explain t the unusual size and importance of the urch, and second the welcome absence of the pant villa and the platitude of the successful gh-street. What is left is the natural nucleus a mediæval and Tudor town, the fine church minating its surroundings from a hill and, nd and below it, a spontaneous grouping of , market hall, shop, and dwelling house. st of the town is of brick, with an extensive of plaster, where the Essex craftsmen have clearly enjoyed themselves by a delightful ingenuity in patterned devices. The "snub-gable" of the thatched houses, the painted sign of Mr. Sid Grout, chimney-sweep, and the handicraft shop, gave the party an opportunity to observe the local characteristics of the town. Before leaving the village to visit the church, it is only fair to mention the twelve little houses of the new scheme, which do credit to the town and their designer.

Thaxted Church is a perpendicular building with the peculiarity that the aisles are wider than the nave, a feature now turned into account by the small congregation being provided with ordinary chairs in the body of the church while the aisles are kept clear. English churches have suffered so much from the fixed pew habit, and their proportions so crudely mutilated by tramcar accommodation that this change is welcome. Some of the old glass still exists, but the actual beauty of the lighting is again less due to the presence of old work than to the absence of magenta scenes selected from the Pentateuch, while the modern East window is a noble addition. Certainly Thaxted disproves the theory that to be spiritual a church must be dark. The building glows with light and every possible advantage has been taken of the opportunities this offers. Most of us have seen beautiful old churches but, whether at home or abroad, we have come to accept church fitments, hangings, and details as a stock depository, wandering from the red plush of Calvinism through répoussé lilies on High Church satin frontals to the devout efflorescence of Roman sidechapels; all pious and inept expressions from which escape was undreamt. Decorative art as a relish to life was not suitable for a church. It is, therefore, an achievement that the unconventional beauty of the Thaxted church details should at once appear appropriate and not a jar to our sense of tradition. Put frankly, one would like to make every parish priest and every church council pay a pilgrimage to Thaxted, and then, after they return home, they might begin to understand why many artists avoid public worship.

Mr. Tengbom commented on the colours of the four banners in the chancel, and suggested that if they were seen elsewhere they would appear "too pretty." Situated as they are their delicate pastel contrasts enhance where primary colours might have killed. This deliberate choice in colour, material, and detail; the reticence of the many little shrines—take, for instance, the South chapel of the east end, where a raised tomb forms the altar, and the reredos is a fine blue curtain; the simple use of common things, such as honey jars or coloured glass bottles; the absence of fussy unimportance, compose a whole which humbles the layman where he is so often exasperated. The Gothic impulse is not recaptured by fakes of mediæval details; it is found again in personal contribution, peasant and aristocratic, to the glory of God in the spirit of devotion. Benedicite, omnia opera. N. K. R.

MEETINGS

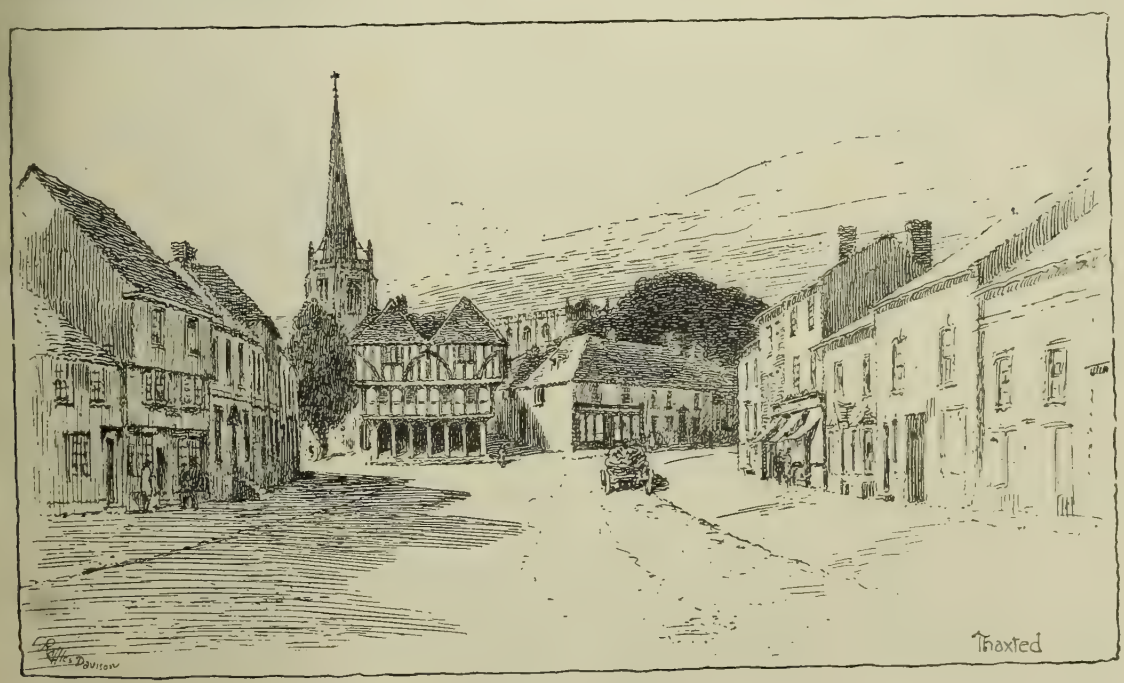
FRIDAY, *May* 23.

Architecture Club.—Dinner. At Hotel Cecil. 7 p.m.

SATURDAY, *May* 24.

Edinburgh Architectural Association.—Visit to Falkland Palace.

Royal Institute of British Architects.—Visit to Knole Park, Sevenoaks.



THURSDAY, *May* 29.

Society of Antiquaries.—Mr. C. R. Peers on "Saxon Monastery and the First Norman Church at Whitby." At Burlington House, Piccadilly, W. 1. 8.30 p.m.

A.S.A.P.U. Elections.

The recent election of officers and members of the executive council of the Architects' and Surveyors' Assistants' Professional Union for the year 1924–25 resulted as follows:—

The retiring President, Mr. J. W. Denington, was re-elected President; Vice-President, Mr. James Macaulay; Hon. General Treasurer, Mr. C. G. Wright; Trustees, Messrs. A. W. Sheppard, Chas. Pickford, R. Gordon Strachan; Hon. auditors, Messrs. C. H. Rattenberry and S. Sanders; Chairman executive council, Mr. Chas. McLachlan; Vice-chairman executive council, Mr. J. A. Gould; Members executive council, Messrs. A. Boulton, Don. Cameron, H. G. Clacy, F. R. Jelley, J. O. H. Hughes, A. M. Laurie, E. G. Lynde, G. W. Mitchell, J. V. Hibbert, A. S. Reeves, H. R. Surridge, J. W. Waghorne, and A. W. Yeomans.

A View in Thaxted.

LONDON TRAFFIC BILL

FOLLOWING up his remarks at the recent annual general meeting of the Roads Improvement Association as to the necessity for widening the approach roads to London in advance of building development, the chairman of the Association (Mr. Rees Jeffreys), in concert with Mr. A. E. Cave, of the Motor Legislation Committee, recently prepared a clause which followed closely Section 64 of the Middlesex County Council General Powers Act, 1921, giving the Ministry of Transport powers to prescribe building lines.

The clause was moved by Sir Thos. Inskip at the meeting of the Select Committee on the London Traffic Bill on May 15, and was sympathetically received. There was, however, some doubt as to whether it was in order. By general consent it was therefore agreed that the clause should be withdrawn and moved at the report stage of the Bill in the House when, with the Speaker in the chair, an authoritative opinion as to whether it was in order would be pronounced. The general opinion was that, if in order, the clause should be added to the Bill.

The following letter in support of the clause was sent by the chairman of the Roads Improvement Association to the members of the Select Committee :—

Widening Roads in Advance of Building.

At the recent annual meeting of the Roads Improvement Association the opinion was expressed strongly by representatives of all classes of traffic that the London Traffic Bill should be amended so as to give the Minister power to prescribe a building line for Class 1 and Class 2 roads, *i.e.*, roads which are maintained in part at the cost of the Road Fund.

The main exits from and entrances to London are being blocked by the erection of buildings quite close to the existing carriageways without, in many cases, provision even for a footpath. In the view of experts, no new building should be erected within 75 ft. or even 110 ft. of the centre of any arterial approach road to a great town. Inasmuch as a London approach road in a length of 20 miles may pass through the area of ten local and three county authorities, it is impossible to secure this increased width except through the agency of some central organisation. Until an authority, municipal in character and representative of the whole of Greater London, is established by Parliament, the only possible agency for securing unity is the Ministry of Transport.

On behalf of the Roads Improvement Association, I beg leave to urge you to support a new clause designed to secure that the exits from and entrances to London shall not be further constricted by the unwise erection of buildings too near the centre of the existing carriageway. This new clause follows closely Section 64 of the Middlesex County Council General Powers Act of 1921, and therefore has been approved in principle by Parliament.

The traffic congestion of to-day is due mainly to the fact that in the past the authorities have permitted the erection of buildings too near the centre of the road without providing margins which could be thrown into the roads according to traffic requirements. On the other hand, it is not reasonable to expect the minor authorities, charged only with the administration of a short length of an arterial road, to widen that road at ocal expense to meet the needs of national raffic.

The alternative to a clause such as is suggested, giving the Minister power to prescribe a building line for each particular road according to the circumstances in each case, is for the Committee itself to enact that within the London traffic area no new building on an undeveloped site shall be erected within 75 ft. of the centre of the road on a Class 1 road, or within 50 ft. in the case of a Class 2 road, and to make proper provision in the Bill itself for compensation to any interests who are worsened by this provision.

Nearly ninety per cent. of the large expenditure of urban authorities on widenings is absorbed in purchasing buildings to pull down and compensating the interests concerned for disturbance. Legislation on the lines suggested will save much of this expenditure, and this saving in a very few years will aggregate to many millions of public money.

WESTMINSTER WOMEN'S HOUSING SCHEME

AT a meeting of the Westminster Women's Housing Council, held recently, at 36, Smith-square, Mrs. Reginald McKenna, who presided, said the Council had been formed in January with the object of collecting information about housing and setting to work to improve it, and hoped to be a real help to the City Council. The following resolution was put :—

"This meeting called by the Westminster Women's Housing Council expresses the unanimous opinion that the housing conditions in many parts of Westminster are below a requisite standard, and hereupon requests the Mayor to call immediately a Town's meeting in co-operation with the Westminster Women's Housing Council, the object of which shall be to give the general public information regarding existing slum areas, overcrowding, &c., and to outline a scheme worthy of the best traditions of the City."

In seconding the resolution Canon Barnes said 75 per cent. of the people of Westminster occupied four rooms, or less, and of the resident population half belonged to the artisan class. In the Covent Garden area there was less than one room per head of the whole population, and the large amount of squalor, vice and disease which existed would be eliminated if the housing were satisfactory. Many of the existing houses were in an unsanitary condition, and the tenants dared not leave for fear of being without any sort of shelter; the Medical Officer was unable to close them for the same reason.

Captain Rice (Garden Cities and Town Planning Association) said it was impossible to consider Westminster housing simply as a parochial question; it could only be solved as part of a comprehensive policy of a much wider area. He believed that the only solution of slum areas in London was by a policy of decentralisation of industry, and the co-ordination of housing with it. Westminster had some of the worst conditions, and it was within the power of the City Council to acquire vacant sites for the erection of houses in which the people could be accommodated temporarily while the houses from which they were removed were being reconstructed. The sites might be costly, but it was one way in which the City could help towards the solution of the problem. Another way was by the conversion of large houses into flats, and a third was by serving notices on property owners and seeing that they were enforced under the Housing Acts. It was also necessary to see that the people who went into the reconstructed dwellings were the people who were removed from the old houses. In the dock area of Liverpool the authorities had succeeded in getting back about 90 per cent. of the population who had been displaced from the tumble-down houses. In cases where reconstruction had been carried out, people who had formerly paid a rent of two shillings and sixpence per week, were prepared to pay eight and sixpence, and even more if necessary.

Miss C. Biggs (hon. secretary, Westminster W.H.C.) said that for a block of forty flats erected at Ebury Bridge by the Westminster City Council there had been applications from over one thousand families. These were occupied by Westminster people. She urged that the vacant spaces—of which there were plenty—should be acquired as soon as possible for the erection of clearing houses to accommodate the people who would be de-housed, and in order that reconstruction of the condemned dwellings might go forward without delay.

The resolution was adopted.

STAFF SOCIAL

THE cordiality of the relations existi between Messrs. Trollope & Colls, Ltd., a their employees was evidenced on Saturd evening, May 17, when the firm entertain about 1,000 employees and their friends in t Battersea Town Hall, this being the fifth Unit Social Evening.

Mr. Archie B. H. Colls presided at the conce and was supported by Mrs. Colls and Miss Col Mr. Christopher Trollope, Mr. Clifford Trollop and Mr. Game. Mr. and Mrs. Fabian Trollo and Mr. and Mrs. Macnamara arrived later in t evening and took part in the dancing. T concert was a great success, the artistes bei selected exclusively from employees of the firm

Mr. Colls addressed the company at the end the concert, and said he was delighted to see many employees present. Referring to t absence of Colonel G. H. Trollope, Mr. Colls rea a telegram from him wishing everyone prese a happy time.

Credit is due to Mr. Hurst (Chairman) an Messrs. A. Winlo, J. Clarke, C. N. Davy, A. C Curtis, A. J. Haughton, P. Clark, and F Burlington, who comprised the committe which was mainly responsible for the succes of the evening. Mr. Horswell (Camberwell carried out the secretarial work.

THE METROCLINE

AT the present time when London bridges are causing engineers so much anxiety, it is interesting to note a new invention—the Metrocline—which is now manufactured by Messrs. C. F. Casella & Co., Ltd., 49–50, Parliament-street, S.W.1.

This instrument has been designed to supply a very general demand on the part of engineers, surveyors, and others for an accurate, simple, and at the same time inexpensive, instrument for ascertaining with extreme accuracy deflections under load of bridges, beams, girders, &c. The design of the Metrocline is such that these essentials are complied with and it has throughout been based on an extensive experience of the many factors which govern practical testing operations on large and small engineering works.

The instrument can be used at any height above ground level without the use of expensive stagings. Where more than one instrument is being used at the same time (*i.e.*, in obtaining deflections of a number of girders composing a single span of a bridge upon the passing of a single load) each may be set to record the maximum deflection; so that one operator can effectively look after any number of instruments no matter how far apart they may be.

The design is extremely simple. No attempt has been made to record on a chart the variations of deflection, which are, of course, indicated, as this simply makes for additional complication and expense.

The moving parts of the Metrocline are reduced to a minimum, and thereby possible errors due to friction are altogether eliminated. The whole working of the instrument can be seen by the operator during the whole time of setting up and taking any tests, and being so simple and easily understood it is practically impossible to get a false result.

TRADE NEWS

We understand that a new company is being formed to take over the business of Jennings Ltd., wood-workers, Pennywell-road, Bristol as from the 23rd inst. The business will be continued and the new company will specialise in the manufacture of joinery and various wood work, and large stocks of timber, building materials, plywood, &c., will be held.

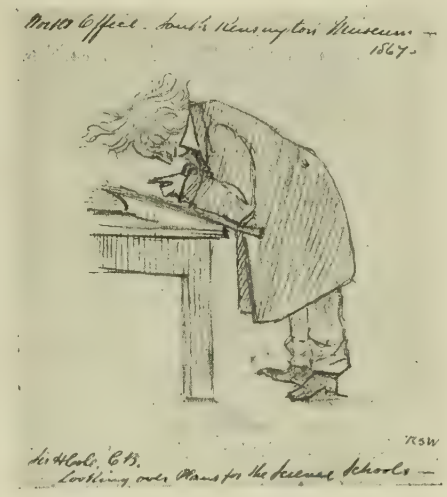
Lady Constance Hatch, of 257A, St. James's court, Buckingham-gate, S.W., is compiling a list of models for exhibition purposes, and would be glad to hear from anyone who has a model as to description, &c.

We are informed that Partridge's Models, Ltd. have removed to larger and more suitable premises at 43, Johnson-street, Westminster S.W. 1.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

May we appeal to our correspondents to submit their queries on paper of a size easily folded, and written as legibly as possible, or better still, in typescript?—Ed.

The Albert Hall.



Sir,—I have seen, in *The Builder* of February 22, your reply to a query about the Albert Hall. You do not give the name of the engineer called on to design the roof, and for the moment I have forgotten it, but reference to the files of *The Builder* at the time would clear this up.

The main ribs of the roof had their ribs resting on roller carriages on the wall plate. You do not state that Sir Henry Cole was the chief of the department, with Colonel Scott under him in charge of the works office. You do not mention the name of Reuben Townroe at that time a modeller of terra cotta for the works in progress at the museum), who was the actual designer of the façade for the Albert Hall. A photograph of his original sketch I have in my possession here. After the project of the Albert Hall was mooted, Sir Henry Cole and Colonel Scott went to Italy to study the amphitheatres. On their return they decided on the size—the radii of the ovals, the heights, etc., and the number of bays the façade was to be divided into; and Gilbert Redgrave, Thomas Verity, J. H. Spanton (Gold Medallist, R.A.), and two or three others, with myself, were turned on the preparation of the plans. The hall was built with the proceeds of the sale of all the proposed boxes and principal seats as freeholds—not a joint stock company, in the usually accepted term.

When the plans were approved by a meeting of the seat freeholders, and by Sir Henry Cole and Colonel Scott, the latter invited Redgrave, Verity, and Townroe to submit sketches for the treatment of the bays in elevation; and Townroe's was accepted and carried out to his details. He also modelled most of the terra-cotta ornament, and designed the side porches—the idea of Sir Henry Cole.

Townroe's Sketch for the Albert Hall.

Verity's sketch was classic, with superimposed columns. Redgrave's, I think, was somewhat Georgian in style. After this I went back to work on the science schools and north court plans.

For the Albert Hall, Verity was responsible for much of the interior details, especially the staircases and refreshment rooms, in connection with which he had consultations with Spiers & Pond, and they afterwards invited him to compete against Phéne Spiers and another for the Criterion.

This building was Verity's first big work, and the engraving* I made of the perspective was the first of many wood engravings I drew for Mr. Godwin for *The Builder*.

I enclose a copy of the photo I mention above, and a photo of a sketch I made at the works office, of Sir Henry Cole. He was looking at his idea of the balcony arcade on the top floor of the science schools. He was an autocrat in the department.

R. Stark Wilkinson, A.R.I.B.A.

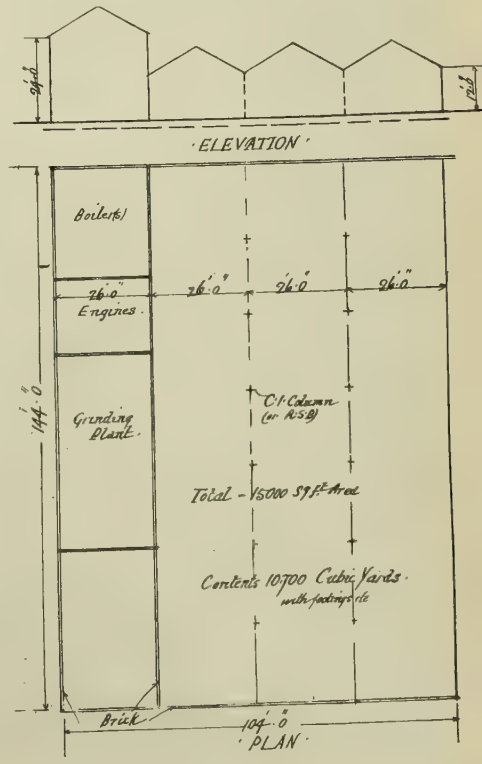
[The additional information furnished by the above very interesting letter concerning the designing of the Albert Hall, Kensington, is much enhanced by the preliminary sketch for its façade made by Reuben Townroe, whose excellent details for the terra-cotta employed in building South Kensington Museum were well known and continue to be much appreciated. His architectural study is quite new to us. Its conception is marked by proportions and elaborated by columniated features totally unlike the elevation of the executed building, while the familiar domical roof which furnishes the remarkable skyline of the Albert Hall is entirely different from this proposal. Nevertheless, by comparing the structure with the sketch, it is evident that the working drawings of the exterior as carried into execution incorporated the main essentials suggested by Reuben Townroe in his scheme for the fenestration and other openings; also the surrounding balcony and the great figure mural frieze. The projections of his cornices, florid entablatures, and crowning lantern feature were wisely moderated or omitted, but his main idea was retained.

Sir Henry Cole (1808-1882), Secretary of the Science and Art Department 1858 to 1873, founded the S.K. Museum. He was a splendid organiser and an autocrat, but cannot be regarded as an architect. Major-General H. G. D. Scott (1822-1883), of the Royal Engineers, rightly or wrongly always enjoyed the full public credit for having designed the excellent science schools' façade in Exhibition-road as well as the Albert Hall. In working out both buildings he certainly relied upon his staff, and the publication of the accompanying elevation considerably elucidates this fact. The interior contrivance of the Albert Hall by Thomas Verity (as mentioned in our previous note printed in *The Builder* for February 22 last) is also confirmed by the timely communication published herewith with the sketches which Mr. Stark Wilkinson has been good enough to send us.]

* See *The Builder* of July 8th, 1871.

Cost of Building.

Sir,—Would you kindly state what is the approximate cost of building for "works" purposes (1) per sq. yd. of floor area, or (2) by "cubic yard of content"—buildings as roughly shown in elevation below and dimensions given. Outer walls brick, up to 12 ft. high, 9 in., with 14 in. work at channels; above 12 ft. high, 9 in. and 18 in.; C.I. columns and B.S.K.S.B. at channels; roofs slated, boarded underneath, simple bound roof; flooring concrete. District, a country district, as in Midlands.



"H. A."

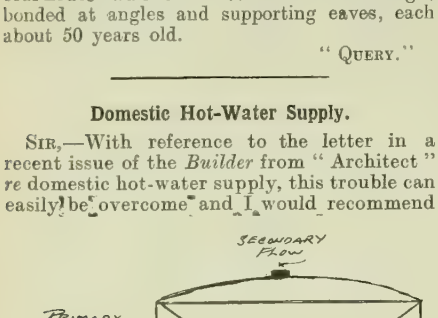
[This class of building presents so comparatively few separate component items of construction that an estimate can most readily be arrived at by the taking off of rough quantities and pricing them out at the rates current in the district.

Estimates by cube and floor area are essentially rough and ready and approximate to the probable cost only where considerable work is involved within a small area, and vary widely in the more open skeleton class of building.

It will be readily seen that for the same cube and floor area the cost could be varied to an enormous degree by difference in the spacing of bays and columns so that it is quite impossible to lay down a hard and fast unit of cost to apply to the cube of this class of building.

The items concerned are mainly brickwork, roof trusses, roof covering, steelwork, windows (probably steel), paving, and a little joinery, and these can be priced out with very little

labour, much of which might be taken on by specialist firms desiring to compete.]



Party Wall.

Sir,—I should like to know the amount of "overhang" that may reasonably be considered safe on a 9-in. party fence wall bonded at each end 18 ft. × 6 ft. high; also a 4½-in. coal-house wall 6 ft. × 5 ft. 6 in. high, bonded at angles and supporting eaves, each about 50 years old.

"Query."

Domestic Hot-Water Supply.

Sir,—With reference to the letter in a recent issue of the *Builder* from "Architect" *re* domestic hot-water supply, this trouble can easily be overcome and I would recommend

your correspondents to have the apparatus emptied down, take off mudhole cover of cylinder, and have the return pipe carried up (as rough sketch enclosed). By doing this he can heat, say, half of the cylinder only.

W. C. Bradbrook.

Lightning Conductor.

Sir,—Can you advise me as to the best construction for the earth connection for a lightning conductor? There appear to be very few works dealing with this subject, and experts seem to differ so widely in principle that it is difficult to decide for the best.

"Novice."

Fixing Grounds.

Sir,—I have heard the opinion expressed that the fixing of wood grounds behind skirtings, frieze rails and other joinery, is redundant. It was pointed out that the joiner in fixing to grounds invariably marks the points where the latter have been plugged to the wall, and nails through at such points only, and that therefore the purpose might be as readily effected if the plugs were left proud and the grounds omitted. I should be most interested to hear the views of practical men among your readers, as such points as these can vitally influence the economical effect of an architect's specification. In these days we cannot afford to spend money uselessly by the vain repetition of stock clauses unless the latter bear a really useful purpose.

"Unconvinced."

Bath Hospital.

The Duke of Connaught recently visited Bath and opened the new Bath Royal United Private Hospital. This is the first portion of a £150,000 scheme for transferring the Bath Hospital from the centre of the city to the outskirts and providing a paying portion as well as a free hospital. The Duke of Connaught also opened the new Children's Orthopædic Hospital, another section of the main scheme. The architect was Mr. A. J. Taylor, and the builders, Messrs. J. Long & Sons, both of Bath.

THAMES BRIDGES: SUGGESTED INQUIRY

The General Purposes Committee of the London County Council recently issued a report, presented to the Council on Tuesday last, with regard to the adequacy of bridges over the Thames. It states:—

"The question of the adequacy of the existing provision in respect of bridges over the Thames within the administrative county of London has been before the Council on many occasions in recent years in connection with various proposals for the reconstruction of existing and the erection of new bridges. For example, powers have been obtained by the Council for the reconstruction of Lambeth bridge, and by the City Corporation for the construction of the proposed St. Paul's bridge. Other proposals have been brought to the notice of the Council from time to time, such as the reconstruction of the existing bridge at Charing Cross for general traffic purposes and the construction of a new bridge over the river from the eastern end of Aldwych, and the Council is now called upon to deal with the emergency created by the condition of Waterloo bridge.

"The number and variety of the foregoing proposals indicate that there is, prima facie, a case for inquiry whether all the proposed bridges are required, and, if not, what new bridges are essential, and also whether the existing bridges are, in condition and capacity, adequate for the traffic they are or may be called upon to bear. It appears to us that the time has arrived when any proposals for constructing or reconstructing bridges should be dealt with in the light of a carefully considered policy covering the whole question of cross-river transit within the administrative county.

"On March 4 the Council passed the following resolution on the motion of Major Barnes, seconded by Mr. Johnson:—

> "That it be referred to the Improvements, Highways and Town-Planning (Special) Committees to consider and report whether steps should be taken to secure that the construction of new bridges and the rebuilding of old bridges within the county of London should or should not have regard to the needs of London traffic as a whole, and to the opportunity offered of improving public amenities.

"We are of opinion that the matter is of such importance that it should be considered in the first instance not only by the Council, but also by the City Corporation, which is the other authority for the provision of road bridges over the river in London. We propose, therefore, that the Council should set up a commission to inquire into the whole subject, and should invite the City Corporation to associate itself with the Council in the matter and appoint one-half of the members of the commission. We will report further later as to the constitution, functions, etc., of the commission, and in the meantime we recommend—

"(*a*) That the City Corporation be invited to join the Council in an inquiry into the existing and future provision of means of road transit across the Thames in London.

"(*b*) That, subject to the City Corporation accepting the invitation referred to in the foregoing resolution (*a*), a commission be appointed to inquire into the whole question of the adequacy, condition, etc., of existing bridges and the necessity (if any) for additional means of transit across the Thames within the administrative county of London, and to formulate a general policy on the subject; and that such commission do consist as to one-half of members appointed by the Council and as to the other half of members appointed by the City Corporation."

Waterloo Bridge.

A report of the Improvements Committee of the London County Council, presented on Tuesday last, states the sudden decision to close Waterloo Bridge was arrived at on the advice of their Chief Engineer. In the report it is stated that:—

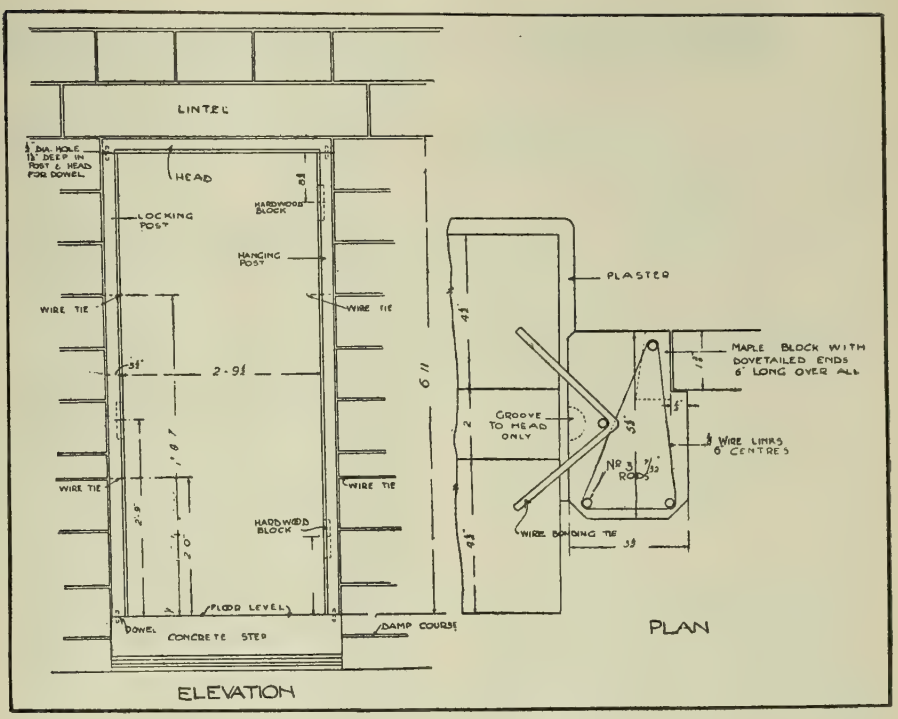
"On April 15 the Chief Engineer reported that the settlement of the fourth pier from the Lambeth side continued at an increasing rate and that it was necessary that steps should be taken at once to support the arches on each side of this pier, involving, incidentally, the blocking of the waterways of these arches. Mr. Basil Mott, C.B., and Sir Maurice Fitzmaurice, C.M.G., who are acting in a consultative capacity, supported the view as to the need for this action. Our chairman, as a matter of urgency, gave the necessary authority, and also decided that, subject to the concurrence of the Finance Committee, the Chairman of the Council should be recommended to authorise us to arrange for the work to be undertaken by the contractor for the construction of the temporary bridge. The concurrence was obtained and the Chairman of the Council agreed to the recommendation on April 24. In the meantime immediate steps were taken for putting the work in hand and the Port of London Authority was informed.

"On the same date, April 15, the Council authorised us, with the concurrence of the Finance Committee, to accept a tender on the basis of cost price with a percentage for profit for the construction of the temporary bridge. On the following day the Chief Engineer reported to our Chairman suggesting that this work should be given to Sir William Arrol & Co., Ltd., who within the last few years had carried out other important contracts on the Thames, including the widening of Blackfriars Bridge and the reconstruction of Southwark Bridge. The firm in question were prepared to enter into a contract on the basis of cost price plus a percentage for profit varying according to the total amount of the expenditure. Our chairman approved of the acceptance of the offer, and the Finance Committee concurred on the same date.

"Pending the completion of the contract, the chief engineer was authorised to arrange with the company for a commencement to be made immediately with the work of support to the existing bridge. The arrangements for this work were completed by April 19, and the work was actually commenced on April 23, 1924.

"On May 10, the chief engineer reported that the settlement of the pier had increased again within the previous ten days. He was of opinion that, considering the natural hindrances due to want of head room and the rise and fall of the tide, the contractors had made good progress with the work of supporting the arch on the west side of the pier, but that some weeks must pass before the work could be completed. Having regard to these facts, he considered it advisable, both as a measure of precaution and to expedite progress with the work of making the structure secure, to take steps to close the bridge to all traffic as from midnight, Sunday, May 11, 1924.

"Letters and a petition have been received from ratepayers and tradesmen in occupation of premises on the approaches to the bridge, pointing out the loss of trade resulting from the complete closing of the bridge and asking whether it could not be opened to pedestrian traffic. Much as we regret the inconvenience and hardship caused, we are compelled to come to the conclusion that the complete closing of the bridge is in the best interests of the public both from the point of view of safety and because it may be expected to shorten the period of closing by giving the contractors uninterrupted possession of the roadway between parapets for the purpose of the works. It has, in fact, already become necessary to take up the roadway so as to lessen the load on the pier in question."



COTTAGE CONSTRUCTION

N view of the claims for alternative hods of construction which are now being ed in many quarters as a solution of the sing problem, Mr. Albert Lakeman's new k* is published at an opportune time. As author says in his preface, "A great deal nsatisfactory cottage construction has been uted in the past owing to misguided efforts reduce the cost to a figure inconsistent h a reasonable expenditure," and the chief pose of this book is to give sound informa- on the use of concrete so that those re- nsible for the conception and execution of form of construction will be helped to duce the best work without incurring un- essary expense.

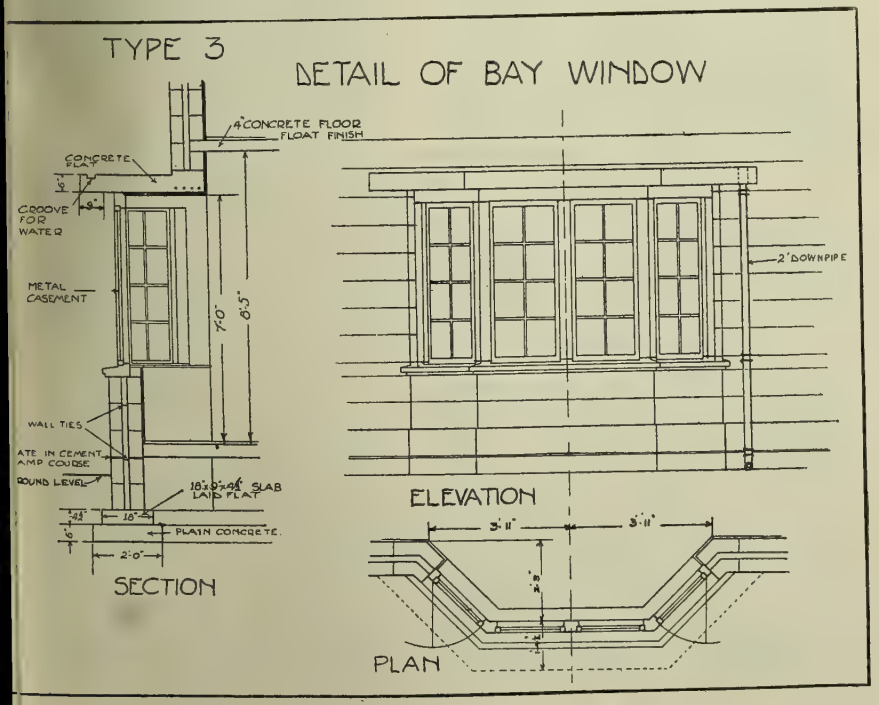
he book contains 256 pp. and over 200 strations, and is divided into chapters giv- General Principles of Concrete Cottage struction; *In situ* Work; Concrete Block struction; Designs for Cottages and Bun- ows; Design and Construction of Garages; neral Information for the Builder; Alterna- Methods of Construction; and Machinery Concrete Cottage Construction. Thus the ole subject of the construction of small ldings in concrete is thoroughly dealt with, l so far as we can see no detail on which ormation is likely to be required by those h no previous experience of concrete cot- e construction has been omitted.

llustrations of attractive concrete cottages, ngalows, and garages which have been built ring the past few years, such as those at rmanstown, designed by Messrs. Adshead l Ramsey, FF.R.I.B.A., and Professor trick Abercrombie, F.R.I.B.A., in colla- ration, are interspersed throughout the text. l coloured plates are given showing the ious colour effects which may be obtained the simple operation of washing the film cement from the surface of the concrete fore it has finally set, and exposing the gregate.

But perhaps the chief interest lies in the apter in which the author gives his own as, the result of a very large experience this class of work, as to how concrete cot- ges should be designed in order to get the st results from the material from both the

Detail of Concrete Door Frame.

"Concrete Cottages, Bungalows and Garages." Albert Lakeman, M.S.A., M.I.Struct.E., London: ncrete Publications, Ltd., 4, Catherine Street, W.C.2. ce by post: Cloth bound, 5s. 9d.; paper covers, 4s.



æsthetic and economical points of view, and this section should be of much interest to architects who have had no previous experience with concrete cottage construction. In this chapter there are included seven designs for cottages, bungalows and garages, and each design is thoroughly worked out with plans, sections, elevations, and all the working drawings necessary for the construction of the buildings. In connection with this chapter the author says: "It is not intended to supersede the architect by giving information of this character, but rather to encourage the use of concrete on satisfactory lines," and as such information does not appear to exist in any other form, and there are still many architects who have not carried out this class of work, the information should be decidedly useful.

We give on this page two drawings taken from the book, showing its practical nature. "The door frame," says the author, "is quite easy to make as there are no elaborate mouldings, and the contractor who is able to make the blocks for the main walls and partitions will find it a distinct advantage to manufacture any other concrete units which can be satisfactorily applied. A saving is made as regards the painting of the frame throughout, and an important item in cottage maintenance is eliminated. Wire ties are cast into the side posts with projecting ends which are built into the joints as indicated, while pro vision for fixing the ironmongery of the door is made by the insertion of dovetailed hardwood fixing blocks or other means."

The bay window is simple in character. The roof is formed of a small concrete slab, 6 in. thick, having a raised portion with reinforcing rods at the inner edge to form a lintel for carrying the wall above. The rain water would be drained into a groove around the outer edge and carried away by a 2-in. downpipe, as indicated. The outlet for the pipe would be cast in when the pipe is connected, and no special fastenings are necessary.

These two illustrations will give an idea of the practical nature of the book, and when it is stated that there are more than 60 drawings of this kind it will be realised that the ground is very thoroughly covered.

In his contention that properly designed concrete cottages, built with a regard for the characteristics of the material, are cheaper than brick, the author does not hesitate to give adequate data. Thus a full bill of quantities is given for each of the seven types of buildings, so that any architect or builder can see for himself on what items the saving is effected. Further, the book contains a table giving the comparative estimated cost of a pair of concrete cottages from one of the designs given in the book and a pair of brick cottages of the same size; in this table every item of material and labour required for each method of construction is set out side by side so that they can be readily checked by those interested, and a total of about 10 per cent. saving is shown in favour of concrete, which the author points out would be considerably more in large schemes if mass production methods and good organisation were employed.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

The Government's Housing Plans.

Mr. Wheatley, the Minister of Health, in reply to Mr. T. Thomson, said he hoped to be able to introduce the Housing Bill at a very early date. The following was a copy of the letter which he had addressed to the representatives of local authorities whom he met recently, giving the results of the discussions which he had with them:—

"I am directed by the Minister of Health to refer to the Conference on the Government's Housing Proposals at which he received representatives of the local authorities of Great Britain on the 8th and 9th instants. The Minister understands that the representatives of the local authorities wish to have recorded his views on certain resolutions framed by them and submitted to him, and he desires me to make the following comments on the resolutions:—

"Resolutions (*a*) and (*b*) are as follows:—

"'(*a*) That, in carrying out any building programme under the proposed legislation, the local authority should retain full power to fix the number of houses which it will build in any period, subject to the limitation of a maximum number by the Minister of Health, and also full powers at its discretion to suspend building operations for any reason whatever at any time, and that such suspension should not involve the imposition of any burden upon the rates or other penalty.'

"'(*b*) That the autonomy of local authorities with regard to the execution of the proposed new Act should not be less than exists under the Housing, etc., Act, 1923, except in so far as may be specifically agreed by the authorities with the Minister of Health before the proposed Bill is presented to Parliament, and that in the event of any statutory or other committee being appointed in accordance with the proposals contained in the Report of the National House-Building Committee, such committee should not be authorised to interfere with or in any way to affect the powers and duties of local authorities.'

"The Minister concurs generally in these paragraphs, and in particular appreciates fully the importance of leaving unimpaired the autonomy of local authorities under the Housing Act of 1923.

"Resolution (*c*) is as follows:—

"'(*c*) That a local authority should retain power to use building materials purchased in the cheapest market, wherever situate, and to obtain tenders under competitive conditions.'

"Local authorities will retain power to use building material purchased in the cheapest market, wherever situate, and to obtain competitive tenders.

"Resolution (*d*) is as follows:—

"'(*d*) That the dimensions of houses specified in Section 1 (2) of the Housing, etc., Act, 1923, should be retained for the purposes of the new Act, but that the Ministry should have the power on representation from any local authority to reduce that standard.'

"The Minister notes that it is the view of representatives of local authorities that the dimensions of houses specified in the Housing Act, 1923, should be retained for the purposes of the new Act, and he proposes to adopt this course.

"Resolutions (*e*) and (*f*) are as follows:—

"'(*e*) That the fixation of rents should continue generally on the same basis as that laid down for the fixation of rents of houses erected under the provisions of the Housing, Town Planning, etc., Act, 1919, but that if as a result of the limitation of rents under the proposed legislation it should be found necessary to reduce the rents of houses erected under the 1919 and 1923 schemes, the Government should increase the allowances to local authorities so as to prevent such authorities being placed in a worse position than they now occupy.'

"'(*f*) That the Government be asked to pay two-thirds of the loss incurred on approved expenditure, and that in view of the difficulties in rural areas and in small urban districts, the amount of the assistance shall be increased.'

"The questions of fixation of rents and Government contributions were fully discussed at the Conferences, and the following proposals were made by the Minister:—

"(i) The Government will propose a subsidy of £9 a house for forty years for houses to be provided for letting, on the understanding that local authorities will be prepared to provide a further subsidy of £4 10s. a house for forty years.

"(ii) The aim of the present scheme is to secure rents in each locality equivalent to the rents now prevailing there for working-class houses built before the war.

"(iii) Until these rents can be reached, local authorities will charge such rents as will be remunerative after allowance has been made for the total subsidies of £13 10s. a year for forty years mentioned in (i).

"(iv) If in any district the rents to be aimed at, as described in (ii), can be secured for a smaller total subsidy than £13 10s. for forty years, the local authority's contribution shall be reduced accordingly until wiped out.

"These propositions were accepted unanimously by the representatives present at the Conferences, and they promised to recommend them to the bodies by whom they were appointed.

"The further resolution is as follows:—

"'Further resolved—That local authorities shall be free to seek to obtain such amendments to the Housing Bill, when presented to Parliament, as they may deem desirable.'

"The Minister accepted this resolution.

"The Minister undertook to consider further the case of certain local authorities, particularly the agricultural areas, who are in an exceptional position, with a view to securing for them additional assistance, and it was arranged that representatives would be appointed to discuss this matter with him.

"At the end of three years from the passing of legislation, the financial arrangements for houses to be erected after the date under the scheme will be reconsidered by the Minister and the local authorities in the light of the actual experience gained during that period."

Loss under the Addison Scheme.

Mr. Wheatley informed Mr. G. Ward that the annual loss to the Exchequer in respect of houses erected under the provision of the Housing and Town Planning Act, 1919, was estimated at £7,700,000. The annual cost of collection of rents, including cost of management, was approximately £250,000. Local authorities had been authorised by his Department from the outset to accept applications from tenants to buy the houses at market value if this could be done without increasing the annual loss.

Imported Doors.

Mr. Wheatley informed Mr. Sandeman that an understanding had not been arrived at with the building trade with regard to the importation of doors, windows, and framings into this country.

Foreign-made Goods.

Mr. Wheatley informed Mr. Hannon that the Government had no intention of prohibiting the use of foreign-manufactured goods in the building of houses.

L.C.C. and New Scheme.

Mr. E. Simon asked the Minister of Health whether his attention had been drawn to the figures given by the chairman of the London County Council housing committee showing that the number of houses proposed to be built by the committee of the building industry could not possibly be built on the conditions laid down by them; and whether he would ask them to reconsider their report, especially as regarded increasing the output per worker per week.

Mr. Wheatley said his attention had drawn to the figures in question. He ga that they were based on an augmentati the industry by apprentices to the numb one-third of the number of craftsmen em from time to time on housing schemes understood the proposal of the committ be a wider one, and that the increa apprentices would apply to the whole skilled craftsmen in each district, an merely to those engaged on housing wor

Building Trade Dilutees.

Sir W. Davidson asked the Minist Labour what was the reason for the aba ment of the scheme to train 50,000 ex-S men as dilutees in the skilled branches building trade.

Mr. T. Shaw said he understood that, result of the continued depression in the ing industry, it was found impossibl absorb more than a small proportion o applicants for training under the scheme that it was finally abandoned. He wa in a position to say how many trainees employment.

Fine Arts Commission.

Mr. Ormsby-Gore asked the First Co sioner of Works what was the numbe members of the recently appointed commi of fine arts; how many of these were prac artists, architects, or sculptors who had already employed on public works; number of them were members of the Academy or other recognised societie artists; whether he was aware of the spread criticism with which the commi had been met; and whether, in view of criticism, he would discontinue the grant of £2,000 a year to the commission appoint a committee, with power to take dence, to inquire into the question of further expenditure of public money on a

Mr. Graham (Financial Secretary to Treasury), who replied, said that the mission consisted at present of nine mem These included four architects, one pai one sculptor, and one specialist in town ning. Three of the architects had been ployed on public works; five of the *perso* were members of the Royal Academy, and was the present President of the Royal I tute of British Architects. He was not aw of widespread criticism: criticism and di gence of opinion were always active in realms of art. He saw no reason to disconti assistance from public funds, which was much lower rate than £2,000 per annum, to appoint a committee of inquiry. He believ the Commission were already doing very use work in the public interest. The Commiss was created by the late Government, an might possibly be strengthened by the addi of one or two members.

Land Valuation.

In reply to Sir L. Lyle, who asked whe proposed to introduce the necessary legisla recreating the machinery for the taxation land values, the Chancellor of the Exche said he should as soon as possible name a for the introduction of the legislation shadowed in his Budget statement. The would be quite small, and he anticipated it would be met by savings on the gen Vote of the Department.

Government Housing.

During the last fortnight the cost of buil has, it is stated, risen as follows:—

For working class houses containing a li room and three bedrooms but without a pa the cost in January was £386, in February £ in March £416, and in April £425. This m tenders have been received for similar ho to cost over £500, and some nearly £600 e

These figures are taken from an answer g by Mr. Wheatley to Sir Kingsley Wood week, and refer to non-parlour houses. figures for parlour houses during the same months are:—January, £445; February, £ March, £459; April, £440.

THE BUILDING TRADE

LEASEHOLD ENFRANCHISEMENT

E take the following extracts from a orandum issued recently by the Council of Surveyors' Institution :—

mpulsory Leasehold Enfranchisement uld be against the interest of the Community.

ere will be less incentive when building s are granted to insist upon a good lay-out e freeholder's interest is liable to be limited, the control of part or the whole of the build- estate taken out of his hands or those of his essors.

roperties let on lease on a well-managed te are made to revert to the freeholders at same date, a fact which affords opportunity foresight in the management of an estate, for redevelopment if the buildings are worn or have become out of date. It will be reciated that such improvement schemes are dered impossible if individual lessees have rcised a right to enfranchise. So with leases ack-rents, under present conditions it is an m of good estate management that, in rmining the period for which new leases ld be granted, regard should be had to the e of the termination of the leases of adjoining perties belonging to the same owner.

ny system of leasehold enfranchisement ld seriously militate against the opportunities ch are now afforded of securing the recon- ction of a district on a large scale according modern ideas, and also against obtaining, he minimum of cost to the local authorities cerned, those public improvements which growth of any large city is continually de- rding. Some of these improvements are of h a costly character that it is practicable to ire them only by awaiting an opportunity 'n the local authority would be in a position obtain the land needed for these public poses without having to pay compensation disturbance. Experience shows that not equently the knowledge that an improve- nt is likely to be effected permits a certain s of trader to secure an interest in a property he hope of being able to establish a claim for pensation for trade disturbance. These ms. already sufficiently serious, would be reased if a lessee could claim on the basis of interest without limit in point of time. The portunity for creating such enhanced claims ht, in the public interest, to be avoided.

o most surveyors instances will at once ur where desirable improvements have had e deferred for many years, until it has become sible to execute them without involving the hority in question in the payment of large s for compensation for trade disturbance.

o system which would enable a lessee against will of his lessor to secure an interest of this l would be other than of detriment to the lic interest.

nfranchisement would tend to check trade elopment. Industrial, commercial, and ufacturing concerns frequently acquire the hold interest of adjoining property with the ct of extending their premises on the falling f the current lease. A right to enfranchise ld make this impossible, or would, at any , enable the lessee to prevent such develop- t, except at an unreasonable price.

has been claimed that the leasehold system is to bad building and neglect of repairs. evidence available directly controverts this n. Houses erected on freehold land have to pass the inspector of the local authority, has to concern himself with securing com- nce with the local by-laws. Houses erected easehold land have also to pass the surveyor he lessor, whose interest it is to see that they properly and substantially built. The same ark applies with still greater force to the execution of repairs during the period of the lease. It will be generally agreed by those conversant with the subject that the condition of small freehold property is usually worse than that of leasehold property of the same character.

As a corollary of the preceding paragraph, it may be well to state that the view that separate freeholds, as against a system of large estates, tends to the prevention of slum conditions, is not supported by the facts disclosed in dealing with the slum districts, particularly in an aggregation of population such as exists in London. Experience has shown that in most cases in an area which is condemned under the Housing Acts as incapable of being remedied except by a reconstruction scheme, by far the largest proportion of the houses belong to separate owners over whom there has been no control, beyond that exercised by the local authority, either as to the conditions of the individual premises or their relationship to adjoining property. Even in modern days the power of control by the local authority to prevent the overcrowding of buildings on sites has been slight, and in the construction of the buildings themselves the local authority has only in comparatively recent years had any large power of supervision. Although the circumstances of this public control are different to-day, it is still true that the most effective steps for the prevention of the conditions which produce slums are those exercisable by a lessor through the covenants of leases against additions and alterations to property without his consent, covenants regulating occupation and preventing nuisance, and those requiring it to be maintained and delivered up in a proper condition.

Compulsory Leasehold Enfranchisement would be against Private Interests.

The Freeholder.

On entering into a contract for a building lease each party has certain conceptions in his mind. The lessor understands that he will forego for a lengthy period the enjoyment of the probable increase in the annual value of his property, accepting in place thereof a small fixed annual payment during the term and the reversion at the end of the lease to the improvements effected on the land. The lessee, on the other hand, calculates to be able to recoup himself by the rents received or the occupation value to himself, so that when the time comes for the building or improvements to be handed over to the freeholder its cost has been fully met. Alterations in the basis of the bargain necessarily mean alterations in the basis of value. If the right to the freehold at the end of the lease for which the lessor contracted is taken from him the value of his freehold interest is reduced, while that of the leasehold interest is proportionately increased, without consideration being received or given. It should be pointed out that in most cases the present owners of long leasehold terms are not the persons who made the expenditure on the land, but are rather those who have acquired a definite terminable interest at a commensurate price, and to allow them to acquire the freehold without paying the full value of the land with its improvements is to give them, at the expense of the freeholder, a future value for which they have not paid, and also to make the remainder of the term to which they are entitled more valuable.

The right to enfranchise would give lessees power to prevent redevelopment of building estates or blocks of property, except on the acquisition of those rights at, perhaps, unreasonable rates. The Rent Restriction Acts have provided many actual examples of these possibilities, but that legislation is merely temporary, while legislation permitting enfranchisement would be permanent in character.

The Leaseholder.

Compulsory enfranchisement would not necessarily be to the advantage of leaseholders as a body. While some would obtain a pecuniary advantage through enfranchisement, others would suffer by the deterioration of estates which would frequently follow the withdrawal of supervision and control by the freeholder by reason of the enfranchisement of individual properties.

PRICES OF BUILDING MATERIALS

The report for April of the Deputy-Chairman (Mr. A. V. Alexander, M.P.), of the Inter-Departmental Committee appointed to survey the price of building materials, states that further increases in the prices of bricks are reported from two of the centres included in the schedule. "The Committee are also informed that the Stock Brick Manufacturers' Association have increased their schedule of prices for stock bricks by 4s. 6d. per thousand. In view of the general tendency for the price of bricks to increase the Committee have instituted detailed enquiries in the areas concerned. Slight increases in lime are reported from Birmingham, Newcastle, and Dundee. Bristol and Manchester show an advance in the price of roofing tiles, and at Manchester slates also have increased. On the other hand, there has been a reaction in the price of lead, and, after the sharp increase which has been recorded in previous reports, there has been a fall in price ranging from £1 to £3 a ton."

EXPANSION OF BUILDING AND CONSTRUCTION IN INDIA.

(From a Special Correspondent.)

Materials, &c., Being Introduced.—Activity prevails in importing building and engineering requisites and tools. Stocks of steel building sections of all British standard structural sections are held at Calcutta, Rangoon, Jamshedpur, Lucknow, Delhi and Madras. American manufacturers of wrought-steel hardware and carpenters' tools of highest quality have opened a branch at Bombay. English corrugated asbestos cement roof sheeting at Bombay, Calcutta, Karachi, and Madras, &c.

Indian Projects.—On waterworks and drainage extension at Ahmedabad, £455,000. Under the Sanitary Engineer to Bombay Government, Poona, the additional masonry service reservoir at Pandharpur for the water supply is estimated at £5,500.

A new church is to be built at Delhi, to seat 400 people. Plans are being prepared for a church to cost eventually £40,000.

Town Planning.

In view of the importance of members of the Surveyors' Institution being kept informed as to new town-planning schemes affecting property under their management, or as to the several stages reached by schemes already in course of preparation, the Council has arranged with the Ministry of Health that the latter shall every three months supply the Institution with an up-to-date list showing the stage reached by every town-planning scheme throughout the country. These lists, the first of which will be issued with the *Journal* for June next, will be published every three months.

THE TRADES TRAINING SCHOOL AND ITS WORK

THE judging of exhibits of the students' work executed during the 1923–24 session took place at the Trades Training School, 153, Great Titchfield-street, W.1, recently. Mr. W. H. Evans, Master of the Worshipful Company of Carpenters (under whose auspices the School is conducted), presided. The chairman of the School (Mr. Frederick Sutton, J.P.) was present, and the judges, who included representatives of the Associated City Companies which join with the Carpenters' Company in the maintenance of the School, were:—Mr. G. C. Barnes, Mr. J. Harris Browne, Mr. E. Guy Dawber, Mr. W. J. Englefield, Sir George Frampton, R.A., Mr. J. A. Gotch, Mr. F. T. W. Goldsmith, Mr. W. Stewart Greene, Mr. W. Grellier, Sir W. Goscombe John, R.A., Mr. Bertrand Johnson, Mr. E. Snow Lancaster, Mr. Ellis Marsland, Mr. W. J. Minn, Mr. George Parlby, Mr. W. T. Plume, Mr. Percy Preston, Mr. E. S. Rider, Mr. Frank W. Robson, Mr. S. G. Castle Russell, Mr. H. D. Searles-Wood, Mr. H. P. Shepherd, Sir Brumwell Thomas, and Mr. A. R. Upjohn.

In the more structural crafts of brickwork and masonry, in which the work was considered well up to the average, and an evidence of the keen interest of the students, many practical and in some cases difficult problems were set the advanced students to train them in technique. In the crafts of carpentry and joinery the examples were graded to provide progressive instruction for students of different stages of advancement, and were considered by the judges very creditable, many of the students being young apprentices whose work was pronounced much in advance of their age, while the work of the handrailers showed the scientific aspect of the subject in the setting out of the work. The energies of the wheelwrights were adapted to modern needs in the form of motor work, and their exhibits were considered satisfactory.

The utilitarian work of sanitation and wiring was treated conscientiously in its sphere, the work of the plumbers' class being pronounced as above the average and included specimens of unusual excellence; the electricians' shop was especially useful, well fitting the students for good work in after life.

With regard to the more decorative crafts, the plasterers quite maintained the good quality of their workmanship. The painters' class, which caters for both plain and ornamental decoration, comprised some excellent lettering by juniors of 15 years and upwards, and some decorative stippled work, both much commended.

The metal workers' class was of great interest, especially its brass and copper section. The work, both useful and decorative, was thought to show great promise. The smiths' work was also pronounced satisfactory.

The School is careful to give attention to the specifically artistic crafts. The glaziers' class contained many examples—some of which were designed as well as executed by the students—in which a high standard of design was to be noted, including advanced stained and painted glass of pictorial character. The work of the stone carvers and wood carvers included drawings from casts as well as actual casting and sculptured work, in all of which the spirit of the originals is well rendered and a crispness of effect produced. The figure sculptors' art was represented by a class of modellers from the life (under Mr. C. L. Hartwell, A.R.A.); the work was full of vitality and expression.

The prizes and medals awarded by the judges will be distributed at Carpenters' Hall, Throgmorton-avenue, in the early part of next session, after the School re-opens on September 22.

This School, under the Directorship of Sir Banister Fletcher, gives sound practical instruction to actual craftsmen and apprentices, and throughout attention is confined first and foremost to fitness of execution. The students, however, are encouraged to visualise the design of their work as well as to carry it into execution, with the aim that the products may be things of beauty as well as of utility. As much as possible therefore is done to size, but the small scale models necessitated by large structural features, such as roofs, afford all the needed opportunity for training in the actual problems.

RENT RESTRICTION

IN the paper read by Mr. J. Calvert Spensley before the Surveyors' Institution on the "Economic Effects of the Housing Subsidy and Rent Restriction," and the discussion which followed, reported in our columns on March 14 and 21, there seems to have been a consensus of opinion that as regards "working class" dwellings there was likely to be a continuance of Rent Restriction for some time to come. Sir Theodore Chambers expressed the opinion that Major Barnes's conclusion was correct, that private enterprise in building working-class houses would never come into operation again in their own lifetime, and the writer of the paper pointed out that, whatever economists might say as to increase in rents encouraging supply, there was the politician to consider, and no politician would face the withdrawal of protection from the great bulk of the electors before a margin of accommodation was secured. There are two branches of Rent Restriction, however, one relating to working-class dwellings properly so called where the legislation has, in the opinion of many, killed private enterprise for good and all, but there is the other branch, the protection of the higher valued houses, which has killed the enterprise of letting houses on lease, or agreement, but which has not so far killed building enterprise in building them for sale.

Sir Theodore Chambers said he thought it most unhappy that the views of the majority of the Rent Restriction Committee were not accepted and the Act "lifted off" the houses that were brought into it in 1920, and we are in hearty agreement with him. Why should houses of which the standard rent or the rateable value amount to £105 in the metropolitan area, and £78 elsewhere be continued to be protected? That policy is having a most disastrous effect on the very persons it is supposed to protect, except as regards the actual sitting tenants, for it has rendered it impossible for that class to rent their houses, and they are a class who, owing to lack of capital very often can only take a house on lease and cannot buy. Now that the legislature is again attacking the subject of Rent Restriction and is being urged to continue it, it is extremely important that this question of houses of the higher values should receive careful consideration. As regards working-class dwellings the case is entirely different, for as the local authorities supply them they are let to the tenants which require them, but that is not the case in connection with the higher class houses. Here private enterprise has to supply the demand, and private enterprise as represented by the builders and landlords, so long as restriction continues, will not let the houses on lease but will only sell them. Are they to blame for this? The answer to this question will, we think, be found in the letter written by a "Middle-Class Tenant" to the *Times* on March 17. That tenant was occupying a house he had occupied before the war, held, he said, on a lease which provided "that the landlord shall maintain at his sole cost and expense the premises in sound structural and sanitary condition, and in every respect suitable for the occupation of a family." He must at some time have had to renew his agreement for he stated he was paying the permitted increase in rent, but he wrote complaining that the premises had been allowed to fall into disrepair amounting to dilapidation whilst the landlord "ruthlessly exacted his quota of increased rent." He had apparently done nothing whatever to the house himself for he said "paint and wallpapers have not been renewed for 15 years," thus not distinguishing between "repair" and "decoration."

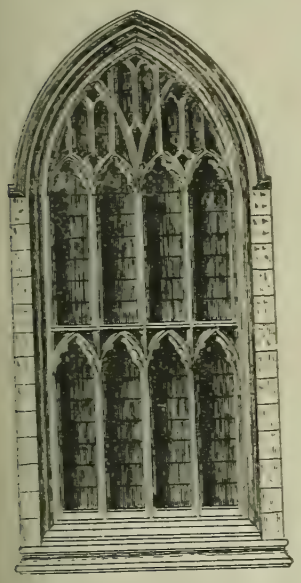
Apparently he had applied to the sanita authority for a certificate, but failed to g it, from which it may be inferred that t sanitary authority was not satisfied that t house "was not in all respects reasonably for human habitation, or otherwise not in reasonable state of repair" according to t Act. Finally he regretted he could not lea the house "in disgust," but admitted that he did so the landlord would be able to re- it "at double or more than double its form rent, the new tenant doing all the repairs, a the landlord smilingly joins the great arm whose spirit of profiteering is now poisoni the whole nation."

Is it possible to state the landlord's ca stronger than this letter does? This may taken as typical of numbers of other case the tenant occupying the house all throu the war, doing nothing whatever to the pr perty, and when in 1920 or at some date ther after being compelled to pay a forty per cen increase in rent expecting everything to done on a pre-war basis, and abusing t landlord who is compelled to keep him as tenant, although on that tenant's own sho ing the property in the open market is wor double the rent he is paying, the tenant doi all repairs.

We cannot too strongly urge upon th legislature now they are again thinking legislating on Rent Restriction that in the in terests of all concerned the higher value houses should be treated on a different bas to the working-class dwellings. Rent Restric tion has killed private enterprise as regard the latter, but the State, or rate-aided munic palities, are coming in and will eventuall provide houses which can be rented by the class. But it cannot be either possible or de sirable that the higher-valued houses shou be provided otherwise than by private ente prise, and the continuance of restriction putting an end to the leasing of such house altogether, and placing that large class persons who have no capital to buy houses in a most difficult position. Unless the relation ship of landlord and tenant is to be put an end to altogether there is urgent necessity to withdraw from control at any rate the highest class of houses only made subject to restric tion by the Act of 1920.

NEW BUILDINGS IN LONDON

Kensington.—BUILDING.—New premises are now being erected at Church-street for the Gas Light and Coke Co. The building is of brick and stone construction. The facing bricks are to be Collier's hand-made red, with Portland stone dressings. The floors are of hollow tile. The sub-contractors are: Steelwork, Messrs. H. Young & Co., Ltd.; heating and ventilating, Messrs. J. Jeffreys & Co., Ltd.; hollow-tile floors, Messrs. Diespeker; drainage system Messrs. Burn Bros. Mr. H. Austen Hall F.R.I.B.A., of 6, New Burlington-street, W. 1 is the architect for the work.



Mortimer-street.—WAREHOUSE.—A building is now in the course of erection at 40, Mortimer street, W.1. The building is to be used fo warehouses and shops. The sub-contractors are Messrs. Lindays, Paddington Ironworks steelwork; Mr. Courtenay, Fulham, stonework The general contractors are Messrs. H. Brown & Son, Albion Wharf, Westbury-road, W.2.

Streatham.—ALTERATIONS. — Alterations are being made to the "Crown and Sceptre," near Streatham-hill. The principal sub-contractors are: Messrs. Samuel Haskins Bros., Ltd., roller shutters; Messrs. Doulton & Co., Carrara-ware front (terra-cotta); Messrs. H. Hope & Sons steel sashes; Messrs. Medway's Safety Lift Co. Ltd., lift; Messrs. A. D. Dawnay & Sons, Ltd. constructional steelwork; Messrs. S. B. Goslin & Son, ornamental ironwork; Messrs. Comyn Ching & Co., heating. The builders are Messrs H. V. Clogg, of 81, Vallance-road, E.1. Messrs F. J. Eedle & Meyers, 8, Railway-approach London Bridge, are the architects for the work

BUILDING THROUGHOUT THE AGES

s his seventh lecture,* entitled "The Romance Building throughout the Ages," delivered ore the Junior Members of the Amalgamated iety of Woodworkers, at Liverpool, Mr. orge W. Thompson dealt with the English thic period. He gave the following particu- s of some of the Cathedrals illustrated :—

Chester (1128–1508).—Tradition said that a uidical temple stood on the site of the present

Perpendicular Window.

uilding. There was a fine perpendicular central ower. The choir screen, roof and reredos were f olive-wood brought from Palestine.

Carlisle (1150–1419).—There was a perfect cacery window at the east end of th s cathedral. Much of the cathedral was destroyed during ivil wars of the seventeenth century. The

Anglo-Saxon Tower.

tained glass of the east window was over 500 ears old.

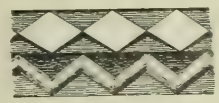
Bristol (1160–1500).—An original Augustinian nonastery which was dissolved at the Refor-

* Earlier lectures in this series were given in *The Builder* as follows :—1, Feb. 1 ; 2, Feb. 15 ; 3, Feb. 29 ; , March 14 ; 5, April 4 ; 6, May 2.

mation ; Norman chapter house ; Early English lady chapel ; decorated choir ; nave rebuilt in the nineteenth century.

Bangor.—As a monastery this was important, 2,000 monks living there at one time. The original building was destroyed by the English in the thirteenth century. The present building was built in the fourteenth century, and restored by Sir Gilbert Scott in 1866.

St. Asaph.—Although Christianity, owing to the Saxon invasion, nearly perished in the rest of the island, it lived in Wales and Cornwall. St. Asaph was the smallest of our cathedrals, and was restored by Sir Gilbert Scott.

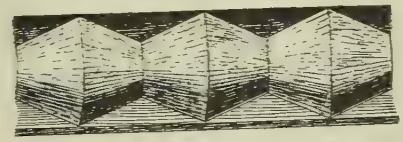


Llandaff.—First erected in the eleventh century, this became a ruin. The present building was restored in the nineteenth century.

St. David's.—Founded by St. David, the patron saint of Wales. The roof was flat and of Irish oak. The rood screen was decorated.

Peterborough (1160–1496).—The original abbey was entirely destroyed by the Danes in the ninth century. The prevailing style was Norman. The west front was one of the finest in Europe. Catherine of Arragon (first wife of Henry VIII) and Mary Queen of Scots were originally buried here.

Southwell.—Served the counties of Notts and Derby and was only little known generally. Norman nave, transepts and towers. The east end had lancet windows of great beauty.

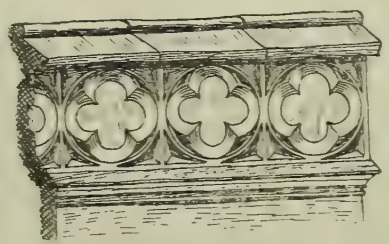


Lincoln (1184–1438).—Chiefly Early English in style. The central tower was 271 ft. high.

Z -Zag.

Billet.

Double Cone.



Norman Mouldings.

Early English decagonal chapter house. The lower portions of the two western towers were Norman, whilst the upper parts were perpendicular. The choir was very beautiful.

St. Albans.—Begun in the eleventh century ; became a cathedral in 1875 ; longest nave in England.

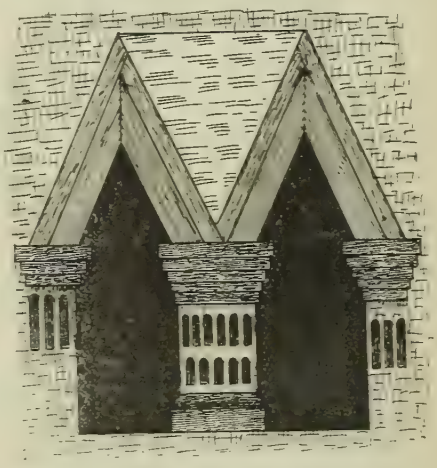
Wells (1205–1465).—Often referred to as Bath and Wells. A spring, known as St. Andrew's well, was near by ; it was supposed to be bottomless and to possess healing properties. The nave, transepts and choir were Early English.

Salisbury (1217–1274).—Took less than sixty years to build, and thus had the distinction of being confined to one style, which was Early English. The spire, the loftiest in the country, was 404 ft. in height. The nave had on each side nine groups of clustered pillars from which

Perpendicular Parapet.

Early English.

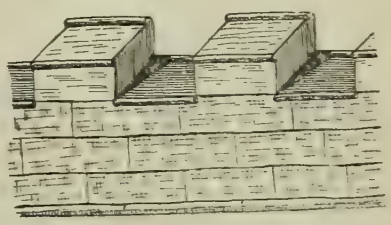
Perpendicular.



Decorated.

Types of Crochets.

sprang ten pointed arches. Above these were the triforium and the clerestory. The Purbeck marble, being rich in fossils, added greatly to the effect of the masonry. The choir screen was a fine example of wrought-metal work.



Lichfield (1295-1430).—The central and two western spires were in the Decorated style. Early English west front. The clerestory windows were of spherical triangular form. Marble reredos.

Anglo-Saxon Window.

Worcester (1218–1380).—Originally an important Roman station on the River Severn. Fine perpendicular tower, 196 ft. high. The tower had a pierced parapet with octagonal turrets, carrying small spires at the four corners. Cromwell's soldiers wrought great mischief here.

York (1227–1420).—Among the forty companions of Augustine on his first arrival from Rome was Paulinus, who was afterwards created

Early English Parapet.

first Bishop of York by Augustine. The building was the largest and in many respects the most magnificent of English cathedrals. The east window (75 ft. by 32 ft.) was probably the largest in the British Isles, but the east window of the new Liverpool Cathedral probably exceeded it.

Liverpool.—Diocese formed 1880. Church of St. Peter was used as cathedral until its demolition in 1922. Architecturally the building possessed no merit, and we had reason to be thankful that we had escaped from a period (1704) when architecture was at such an ignoble level. We must remember, however, that it was not a building that constituted a cathedral, but the situation of the "cathedra," or Bishop's chair.

FLYING BUTTRESS.

Ripon.—Early English western and central towers. Organ on rood screen.

Wakefield.—Diocese formed in 1887. Nave perpendicular.

Manchester (1380).—Nothing was known of the early Christian history of Manchester.

St. Germans.—Diocese of Sodor and Man. Present building in ruins.

Truro (1877).—Finest twentieth century church in England. Choir stalls of teak.

St. Paul's (1675–1710).—Built by Sir Christopher Wren after the Great Fire. The dome, which consisted really of three domes, was 365 ft. high. Choir contained carvings by Grinling Gibbons.

Although cathedrals varied in plan, their principal features were: A chapel at the principal entrance; a nave or main body; side aisles, which did not always rise as high as the nave; the choir and, between it and the nave, the transepts, which rendered the plan cruciform in shape. At the end of the choir was the high altar, and beyond that a chapel dedicated to the Virgin Mary. The choir was often terminated by an apse. Along the side of the choir were ranged richly carved seats or stalls in oak or stone. Among these was the Bishop's Seat or Throne. Other minor parts were the muniment room, in which documents were kept, the library, and vestries.

National Radiator Co., Ltd.

We have received from the National Radiator Company a folder which demonstrates in a concisive manner the merits of the "Cookanheat" Ideal Radiator and Boiler.

Builder's Estate.

Mr. Henry John Appleton, of Oak Dell, Page Heath-lane, Bickley, Kent, of 24, Cambridge-street, Hyde Park, W., and of 49, Connaught-street, Hyde Park, W., builder and decorator, left £48,306.

RATES OF WAGES IN THE BUILDING TRADE

The following are the rates of wages in the building trade in England and Wales. Ever endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.

THE SCOTTISH BUILDER

HE ROYAL TECHNICAL COLLEGE, GLASGOW

HE students and staff of the architecture building day and evening classes of this ege recently visited the following buildings ch are in course of construction :—

he first visit was to the Automobile Club tions, Blythswood-square, Glasgow. The rest in this job is in the fact that, without ring the dignified external design, the re side of the square is being converted a separate self-contained houses, of which ras originally composed, to serve the pur-es of a clubhouse. The buildings were red so that only carcase work remained; entire interior is being replanned and fitted o suit its new purpose. Mr. James Miller, .S.A., is the architect of this work and he Accountants' Hall additions, which were t visited. The new work is of steel con-ıction which was exposed to view at the e of the visit. The old buildings had ginally been self-contained houses of correct ssic style, dating from about the middle of nineteenth century, which, although in cess of alteration to serve as offices, still in much original work of interest.

The next building visited was Messrs. cfarlane, Lang & Company's new biscuit ory at Tollcross. The architect, Mr. Ernest Monro, A.R.I.B.A., explained the in and development of the design of the ory, which included descriptions of many the fitments. A great deal of interesting k was seen, including construction in stone, k, timber and steel; also reinforced con-e floors in process of erection.

The last visit was devoted to Paisley, where ious new works, which are being carried from Sir Robert Lorimer's designs, were ted. The new choir of the Abbey Church, ch was begun by the late Dr. MacGregor lmers, was examined: it is an example masonry carried out in Cullaloe sandstone. only the springer stones of the vaulting e completed, the work was at an instructive ge for inspection.

t the close of each visit, Professor Gourlay, head of the architecture and building de-tment in the college, expressed the thanks the students and staff to the architects of buildings visited.

Housing Progress in Scotland.

THE following figures show the progress that been made in State-aided housing schemes in tland to April 30 :—

	Completed.	Under Construction.
9 Act	24,109	2,989
vate Subsidy Schemes	2,324	—
m Clearance Schemes	430	1,267
3 Act	89	2,809
	26,952	7,065

f the total number of houses completed and er construction under the 1923 Act, 1,023 are the local authorities and 1,875 by private erprise.

Berwick Town Planning.

orth Berwick Town Council recently inti-ed to East Lothian County Council that y are considering a town-planning scheme the burgh and surrounding district, and ed the county's co-operation. It was also orted that Edinburgh Corporation had tten, stating that they were to make a ional survey of the city and district, and t a sub-committee had been appointed confer with representatives of the Corpora-n. Lord Polwarth alluded to the importance uch a survey and the necessity of attention ng given to the county's interests. Colonel J. P. Grant, D.S.O., of Biel, mentioned that, as a similar scheme was being prepared for Gullane, he thought both schemes should be co-ordinated.

Big Glasgow Scheme.

Glasgow may shortly, we understand, promote another big extension scheme to embrace within the city boundaries fully 14,000 acres of suburban and county territory, whose total valuation, it is stated, is nearly £400,000.

A draft of the scheme will be considered by one of the Corporation Committees at an early date. It is understood that the intention of the promoters meantime, at least, is to incorporate within Greater Glasgow certain areas which have been provided with public services by the city, or are being developed as a result of the city's enterprise, notably as regards housebuilding, tramways, &c. Thus, it appears, the scheme is likely to comprise parts of the counties of Renfrew and Lanark, as well as Dumbarton. Already a considerable portion of the area mapped out for amalgamation has been provided by Glasgow Corporation with tramway lines and gas and water mains.

Paisley Traffic Control.

The Paisley Town Council at a recent meeting agreed to a motion by Councillor Dr. Bruce that, in view of the fact that the by-laws for the control of street traffic were framed so far back as 1904, before the advent of general motor traffic, the magistrates be asked to revise and reconsider these by-laws, and if so advised to make alterations to meet modern requirements.

Contract Open in Edinburgh.

MAY 26.—**Edinburgh.**—BUILDINGS.—Erection of six blocks of buildings (24 houses) at Saughtonhall-terrace, for the Saughtonhall Housing Association. Plans by Messrs. C. E. Tweedie & Sons, architects, 54, Frederick-street, and schedules by Messrs. R. & A. K. Smith, F.F.S., 44. Queen-street, Edinburgh.

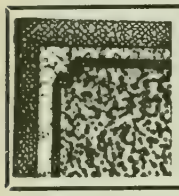
C. Adams & Co., Wellingborough .. £2,109 10
*G. Henson & Sons, Ltd., Wellingborough 2,100 0



WEYMOUTH AND MELCOMBE REGIS.—For construction of tea room in Alexandra gardens :—
*Jenkins, Hitt & Grant, Ltd..... £997
(Subject to any increase in cost of labour.)

WEYMOUTH AND MELCOMBE REGIS.—For supplying and fixing sliding door, Alexandra Hall stage :—
*Betts & Co. £498

WEYMOUTH AND MELCOMBE REGIS.—For two shelters in connection with the Esplanade improvement :—
*Bird & Cox, Ltd..... £582 12

Westminster Housing.

The Minister of Health (the Right Hon. John Wheatley, M.P.) recently opened the City of Westminster dwellings, Pimlico-road, S.W. He was received by the Mayor (Councillor Edgar Horne) and the chairman and vice-chairman of the Housing Committee, Councillor the Rev. E. St. George Schomberg, and Alderman Sir Robert Walden. The dwellings comprise for flats, containing accommodation for 300 persons and to meet the wish of the Duke of Westminster, the donor of the site, only persons with two or more children living with them are to be accepted as tenants.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXVI.—No. 4243. MAY 30, 1924.

THE LITERATURE OF ARCHITECTURE IN RELATION TO THE PUBLIC

ON another page we review an excellent book upon "Modern English Architecture," written by Mr. Charles Marriott. Added interest is attached to this book from the fact that it is written not only by a layman, but by a layman with a fine understanding of architecture as an art, and the underlying factors or causes of which architecture may be said to be an effect.

We have often wondered whether books upon architecture, intended for the public, should be written by architects or laymen and we shared a belief with many that it would be good for architecture and the architect if we had more constructive criticism from the cultured layman. Mr. Marriott has not answered some of our doubts, and submitted some skilful criticism which will command the respect of the architectural profession. It is not our intention to appear disrespectful to the opinions of the architect when we say that the opinions of the layman are more refreshing, partly because they are likely to be more detached, and partly because the final appeal of architecture must be to the public. Architecture cannot exist as an exotic growth divorced from life—and, in point of fact, circumstances combine to keep it always a reflex of life, regardless of what designers may feel—but it is easy to see that professional architectural criticism may take a form which cannot be comprehended by the general public.

There are already a number of small popular books upon architecture written for the public, and although one or two are good in certain directions, there is invariably a difficulty in linking up architectural history with modern building. The emotional and formal aspects of building are frequently overstressed, and we had come to accept this as inevitable since they are the easiest and most popular methods of presenting a fashionable conception of architecture. The whole basis upon which architecture is based (and by this we mean the social, structural and material questions), are either ignored by the authors, or assumed to be beyond the grasp of the general public. It is more desirable, we think, to bring the public into touch with living architecture by dealing, as Mr. Marriott does, with the causes and consequences of building than to convey the impression that fine architecture is either academic formalism or belongs to an age which expressed itself in buildings as an outlet for artistic impulse and dilettante trifling.

For many years it has been urged that there could be no real living architecture until the public could be induced to take an intelligent interest in the subject, and as a generalisation there is no doubt that the contention is sound. In all discussions relating to the public and architecture the simplest course is to lay the blame upon the public, a judgment which is somewhat modified by the statement that lack of architectural knowledge is the real cause. Numerous attempts have been made from time to time to stimulate public interest in architecture, but it has been obvious to many that there are differences of opinion upon the methods by which it is sought to impose our views upon the layman. It is possible to press too much coherent reasoning upon him, and it is possible he might care to be dealt with a little more frankly. He is shrewd enough to appreciate the naïve suggestion that if he took a greater interest in architect's names he would be led to take an interest in architecture (in the same way as many people are led to collect pictures), and he is quite capable of inverting the suggestion and putting it in its proper sequence. To put it crudely: if there were more demand for architecture there would be more demand for architects. This statement we follow with our confirmed belief that a condition such as we indicate would unquestionably benefit both the public and the architect. If we appear to omit the building industry it is because we believe that the buildings we require are built somehow; whereas, we are discussing architecture. If we write in terms of commerce it would be expressed in this form: there is a demand for buildings and there is an output from the building industry, but much of this output escapes the architect. Perhaps the builder is partly responsible; perhaps he is powerless to alter conditions which are a result of the social conditions under which we live. At all events, there is a large ground for the architect to develop, and we have always felt that this ground has been neglected in our architectural literature. It is true that a desire on the part of the public for fine architecture would be reflected in the architecture which we get, but we must recognise this logical distinction, that no amount of propaganda can make much difference to the actual number of buildings to be built, but it can create a desire to obtain the utmost architectural value from every sort and type of building which we actually require.

It is an arbitrary expression to say that architecture grows directly out of life, and much depends upon what we mean. It is a human foible which leads the prospective building owner to believe he will get a cheaper building without an architect, and it is absolute commercialism which leads the manufacturer to erect his factories regardless of architectural grace or the amenities of the neighbourhood. In both instances the real cause may be the same, but they are, unfortunately, direct expressions of our social heritage. We would not submit that it is a desirable thing that architecture should be a direct expression of social life and nothing else; on the contrary, it is the architect's expression of a country's life which gives us the true definition of the architecture of the age. There is surely some significance in the fact that the Street Architecture Medal has been awarded this year for the design of a cinema.

Architecture, of all the arts, is the most sensitive to changes in social life, and, through the architect, exposes in a general way the tendencies of the age. It has been argued that in this form architecture may not be expressive enough, in the sense that it is not bad enough, but this is merely an absurd development of the argument, and does not rest upon an ethical basis. It is no part of an architect's business to reform our institutions, but it is his business to try to yield æsthetic satisfaction by the manner in which he handles his theme. On this subject we find ourselves in complete agreement with Mr. Marriott, who passes his judgment upon modern architecture from this standpoint. Under every heading he arrives at the very natural conclusion that the architect has been successful in his attempts to harmonise architecture with current needs and activities. If architecture is indicative of the social state, and we desire to create a sense of personal responsibility for our architecture, we would not blame the public for its lack of architectural knowledge. We would prefer to encourage the literary profession to foster clearer thinking upon the social problems which obscure the true greatness of architecture.

NOTES

The Premier on Architecture

THE Architecture Club has already done much to justify its existence as a body whose chief aim is to stimulate public interest in architecture, and in enlisting the sympathy and help of the Prime Minister the profession may well feel grateful to the Club. The speech which Mr. Ramsay MacDonald made at the sixth dinner of the Club last week—a report of which appears on p. 866—could have been made by no one who was not greatly interested in architecture, and, as he claimed, things which are beautiful and comforting to the mind. We need not discuss the matters referred to in the Premier's speech, but we suggest that architects might very well consider his questions: "What can the Government do for architecture? How can the Government help architecture? How can the Government help art?" It is a helpful fact that these questions have been asked by the Premier, and we can hopefully expect at least as much sympathy and interest from the Premier of any subsequent Government of whatever party. Mr. MacDonald thinks that the only way just now for the Government to help is as a patron of the arts, which is surely what it always should be; but this implies a knowledge of art, which would enable the Government to be a safer arbiter than it has often proved to be when such a question as the provision of a bridge at St. Paul's has been under discussion.

The Scapa Society.

WE are glad to see this excellent society is getting more publicity for its work. Anything which can increase in the public the knowledge of what it stands for is so desirable that we are glad to call attention to the meeting held recently at the Royal United Service Institution presided over by Lord Lascelles. Lord Newton, in moving the adoption of the thirty-first annual report, referred to the fact that their subscription list did not amount to £100. The Society should have a much larger support than the amount reveals, their work in checking the abuses of public advertisement being so beneficial to the community at large. The Society has now a Bill before Parliament to remove advertising signs from the countryside, and though acknowledging a certain improvement already in this direction, due to the public-spirited action of some advertisers, there is still great abuse as any journey made through the country will show. The great oil companies have been among the worst sinners, and though they have removed their field signs other exceedingly ugly, vulgar and garish methods of publicity are still continued by them. It is very important that in the work of this Society they should concern themselves with the disfigurements of towns as well as the countryside, and this aspect of their work needs emphasising. As the major portion of the community live in towns the amenities of these should be preserved against ruthless advertisement, even more than the country, for the need is even greater. At the same time full justice should be done to the real improvement in the general character of advertisements both in scale and artistry.

The Faculty of Arts.

THE third annual conference of the Faculty of Arts, held on Saturday at the Faculty's rooms, at 10, Upper John-street, bore witness to the increasing power of architecture, not only among the arts but in influencing the public. Professor Adshead's address "The Arts and Environments" incid ally emphasised the engineer's grea weakness. We have nothing but res and admiration for the work of engineer, but while fully realising no branch of science has made gre strides we deplore the attitude tha still too common and which k engineering in a department away f æsthetics. The engineer is prone look down on any attempt to introc the æsthetic element, and yet, unti weds his structural skill with a stri after beauty, engineering works will n occupy the place that is rightly th Such bodies as the Faculty of Arts the Scapa Society, who aim at uni beauty with utility, will, we h ultimately succeed in converting purely utilitarian state of mind to un stand that utility and practical efficie are not everything.

Practical Acoustics.

ONLY quite recently has study of acoustics h lifted from the region myth and prejudice found to yield to scientific analysis. any romantic doubt still exists in mind of the layman who prefers to certain things he does not understanc "indefinable," we have now got the rooms at the R.I.B.A. as evidence of w knowledge can achieve. It is perhaps much to expect that all our public ha concert and committee rooms, can drastically reformed; many have be used for purposes which make padded panel unsuitable, but at least elementary knowledge of the laws gove ing sound would prevent some of muffled effects which are unnecessary inexcusable. As a stimulus to interest comments made recently by Mr. Fil Young in *The Times* on tone in mus

Entrance Gates, Keswick Lodge. Messrs. Brierley & Rutherford, Architects.

adcasting should have good results; many of the problems to which he des should be capable of explanation. nay be argued that architecture has ady too many specialised avenues and t in a harassed and understaffed ctice a man has not the time for ther subject. Prolonged research in istical principles is obviously beyond scope, but the ordinary architect may assured that a very little study will ng a rich return in information, and help to dispel the dangerous illusion t the gift of audibility belongs to the k arts.

Business versus Pleasure.

At a time when trade requires every possible assistance a demand for cheaper postage has been sistently made since the Armistice, at first this demand was negatived on ground that the Post Office must never subsidised, but must pay its own way. Post Office is now, according to the ncellor of the Exchequer's Budget tement, making a profit on all its ices taken together, and the country requested that a return to penny tage might at once be made. The ncellor estimates that this could be e at a sacrifice of revenue (that is, of the profits made by the Post ce) of about £5,000,000. This is the re he has just given in his reply to representations made by the Asso- ions of British Chambers of Com- ce, but he added, "He regrets that this account and in view of other ms for the reduction of taxation ch have been found more urgent it not been possible for the Government authorise the reversion to penny age in the current year." A com- cial community, therefore, turns to Budget statement to a scertain what, he view of the Government, are the ore urgent claims," and finds that the ertainment Duty on the cheaper seats been given up at a loss of revenue in ll year of £4,000,000, and that this sum represents nearly half the whole revenue derived from that tax. As the duty on the cheaper seats is a small sum this loss of revenue does not suggest that those who patronise the cheaper seats have been starving themselves in the matter of amusement, and the cinemas do not employ nearly so many people as did the old theatres and halls, as one foreign-made film supplies a number of audiences with amusement. With industry depressed, what is the special urgency of this sacrifice of revenue at the expense of cheaper postage? Probably our readers will be able to give the obvious reply to this question, so we refrain from suggesting it.

Trees in London Streets.

We must be a little careful before endorsing what appears to be a movement towards the reducing of the number of trees in our squares and streets, or even taking them all away. There are cases in which their growth must be restricted to suit the accommodation of the lighting of houses when they grow beyond reasonable limits and form an obstruction. This is quite another thing, however, from the general acceptance of a theory that would challenge their beautiful and gracious presence in our London squares. We are rather sorry to find the London Society, with whose good work we have so much sympathy, emphasising a view to which we feel sure a very general objection will be raised, and which is held only by a very limited circle. That in the furthering of the amenities of London our London squares should be denuded of their trees is a kind of "tidying up" such as that pursued by the itinerant gardener who in tidying the garden, roots up all the plants. We feel sure there would be a very considerable outcry if any such vandalism were attempted in our squares. The argument that open spaces without trees allow more light and sunshine to penetrate houses, is only plausible when it can be shown that trees prevent them from doing so, and in such cases it can surely be left to localities to decide what is injurious to their amenities and what is not, for in the latter case the advantage of trees to the appearance of a street is undeniable. The charm of trees in a public thoroughfare may be instanced in the case of Notting Hill, where the hill is given a very attractive appearance as the result of many years of growth. It would be a great pity when we are just now entering into the charm that trees bestow—when their growth has reached beyond that of the perky sapling, a state which is no more than the promise of future attractiveness—if ruthless hands were laid on them for a theory so abstract and conventional.

Our London Squares.

Even more serious than in the case of our streets—when we think of these cool and shaded oases from the roar of the traffic—is it to regard the consequences of removing the trees and shrubs from our London squares. That such trees, as is alleged, screen the architectural features of the square is easily disposed of by any who will take a glance at them. Lincoln's Inn Fields, Bedford-square, not to mention others—what injury does their architecture suffer by their graceful presence? The effects of architecture are seldom better seen than when relative to nature. This natural drapery and accompaniment reveals architecture to its further advantage, as when good its relationships are so near to nature. In London especially we feel this touch of nature in our midst to be a real compensation for its enormous growth. Moreover, trees harbour song birds, and the pleasure of bird life which can be heard and watched with so much interest would be taken away. Trees also take out of the air what we do not want, and are an addition to the health of a city. Men do not live by architecture alone, nor are its claims the only ones that we are to be denied the pleasure of that touch of nature in our streets and squares which holds so strong a place in our affections.

GENERAL NEWS

Professional Announcement.

Mr. Ernest J. E. Moore, A.R.I.B.A., is commencing practice as an architect, surveyor and civil engineer at "Haresfield," Salisbury-road, Maesteg, Glam.

Change of Address.

Mr. Wilfrid Travers, F.R.I.B.A., has removed his offices to 36, Furnival-street, Holborn, E.C.4.

Architectural Association of Ireland.

We have received from the Architectural Association of Ireland their syllabus of meetings, &c., for the session 1923–24. In spite of the unsettled state of the country, the membership now amounts to one hundred and thirty-three. The committee recorded, with regret, the deaths of two of their members, Mr. Harold Kilmartin and Mr. R. O'Brien Smyth.

Northern Architectural Association.

A series of visits to local works, and excursions to popular country resorts, has been arranged for the summer session by the Northern Architectural Association Club, which has its headquarters at Higham-place, Newcastle. Definite arrangements include: May 30, Lord Roberts' Memorial Workshop, Newcastle; June 9, Club's annual excursion by motor coach to Blanchland.

Old London.

We have received three further contributions to the useful and interesting series of "Lunch-Time Rambles in Old London," *i.e.*, No. 7, "In the Steps of Shakespeare: Along the Bankside," by Dr. William Martin, F.S.A.; No. 8, "Along Cheapside," by Mr. W. G. Morris; No. 9, "The Precincts of the Temple," by Mr. Prescott Row. Each little work is a seriously considered contribution to the study of London, and includes a clear plan as well as one or two other illustrations The price is 6d. net, and the publishers the Homeland Association, Ltd.

Incorporated Church Building Society.

At the monthly meeting of the Incorporated Church Building Society, grants were made towards building the first portion of new churches at Bellingham, St. Dunstan, Kent, £350; and Westcliff, St. Michael and All Angels, Essex, £350. The following grants were paid for works completed at Pixmore, St. Paul, Herts, £200; Cowplain, St. Wilfrid, Hants, £100.

War Memorial Houses.

A considerable amount of money remains after providing for the war memorial to the officers and men of the Royal Welch Fusiliers who fell in the war. The Comrades' Association of the regiment, who have had charge of the administration of the funds, have, therefore, decided to apply it in the following manner. They propose to erect a number of houses on land adjoining the barracks at Wrexham for the accommodation, rent free, of aged Army pensioners who have served in the regiment.

Society of Architects' Scholarships.

The Society of Architects offers a scholarship open without fee to any British subject between the ages of 25 and 40 for the study of modern architecture abroad. The winner will be entitled to £300 to be spent on the cost of travel and on the study of architecture in America, £250 being paid at the beginning of the period and £50 more if the student produces a report that constitutes a "serious contribution" to modern architectural ideas.

Atmospheric Pollution.

The ninth report of the Advisory Committee on Atmospheric Pollution has just been issued, and covers the year ended March 31, 1923. It is shown that there was a distinct improvement in the purity of the air during the year as compared with the average of preceeding years. The highest total deposit was in Rochdale and the lowest in Rothamsted; the greatest amount of tar was deposited in Newcastle Tyne, while the highest deposit of sulp was found in Southwark Park, London.

Kedleston Hall.

Work has been commenced in connection the remodelling of Kedleston Hall, near D for the Most Hon. The Marquess Curz Kedleston, K.G. The architect for the a tions is Mr. A. S. G. Butler, F.R.I.B.A., 6 Queen-street, Westminster, S.W.1.

The contractors are:—Messrs. Walk Slater, Derby, builder's work; Messrs. Be & Sons, Ltd., 115, Victoria-street, Westmi heating, hot water supplies, sanitary w Messrs. Tyler & Freeman, 40, Chancery- W.C.2, electric lighting and power.

Obituary.

We regret to record the death, which place recently, after a brief illness, of Mr. Pomeroy, R.A., the eminent sculptor. Pomeroy entered the R.A. Schools in and won the Gold Medal and Travelling Stu ship for Sculpture in 1885. He executed public monuments in Great Britain and Colonies, notably Robert Burns' cente statue for Paisley, N.B., and for Sydney, South Wales; W. E. Gladstone for Hous Parliament; Duke of Westminster for Ch Cathedral; Archbishop Temple for Canter Cathedral; and the monument to Lord Du and Ava, Belfast. He also decorated important public edifices.

Statues and Memorials.

Westminster City Council has had a l from the Right Hon. F. W. Jowett, M.P., Commissioner of Works, stating that a future his Department will look to the Arts Commission for advice on statues memorials, it will not again be necessar call together the members of the Sites C mittee, which for several years past has adv successive First Commissioners on the diff questions that have arisen in connection the placing of public statues and memorial London. In formally announcing that work of the Committee has come to an end Jowett feels that, as present head of the Dep ment, he ought to put on record his w appreciation of the valuable services rend by the Committee, not merely to his Dep ment, but to the whole cause of good tast the selection and placing of our public memor

Exhibition of Modern Design.

For the War Memorial Committee Designs for war memorial. Sending-in September 30. (See advertisement this we

Other Competitions.

Other competitions still open include following (the dates given are, first the send in date, and second the issue of *The Builde* which full particulars were given):—Indust Designs (June; Dec. 21, 1923). Ross-Sn Memorial (Sept. 30; Feb. 21). Glasgow Pu Hall (July 4; May 2). Football Stand Edinburgh (June 9; May 23).

THE EXHIBITION OF ODERN ARCHITECTURE AT WEMBLEY

w years since the exhibition of modern cture, including Great Britain, the ons and Colonies, which has been d by the Royal Institute of British ets and the Architecture Club in the of Arts at the British Empire Exhibi- Wembley, would have attracted little n from the public. The size of the ture room at the Royal Academy and parative desertion is proof of the apathy so-called cultured. But to-day it is a at the man in the street is making it siness to comprehend mysteries which were the especial province of the prac- . It is an exhilarating sight to see wds lining up in a vast queue outside lace of Art in order to be entertained structed. The truth is that building ng into its own and is being widely ed as a national possession. Two have combined to bring this change Press, if we may say so, and orts of the Architecture Club. It is alised that architecture, to be complete tional, must represent something more display of individual talent; in other it must reveal ideals common to all and through this agency exert its in- on the public mind. In the exhibition we encounter many recent buildings will appear as new to the public, with ervation that for the first time we are to appreciate what is being done in minions and the Colonies. There can doubt of the fact that a great advance n made towards closer collaboration by ts themselves, there is evidence of sympathy and appreciation of results— he good, for the critic was growing a red of the parrot cry that one man's as better than another's. It is this g up of ideas and ideals which is the difference of view-point to-day. Build- its finest aspects reflects the character tion as of a community, and no surer xists of the strength of the Empire and e and ideals now current than the age of photographs of buildings now d to the public eye.

works shown are astonishingly sane and One is compelled to admiration not by ious repetition of the same theme but fact of the diversity of interest, for all ldings, with few exceptions, are in the ue to cause. The point to be remarked growing appreciation of consisteney on t of architects and the refusal to be from sane expression by fantastic ent or over-indulgence of the mellowed tradition.

ps the chief reason for congratulation ay British architects have improved in ter of handling the layout of groups of s and civic centres. There is to-day grasp of possibilities in this regard s the case a few years since. In addi- s evident that civic architecture is now as much attention and care as was bestowed on work of domestic con- . Moreover, there is the modern the work, not ultra-modern in any ut a right and proper view that the s of the moment are vital to the and prosperity of the scientific art. the past hundred years architecture fered from many changes and ill- ed experiments; but viewed in retro- it can be concluded that under such ances as prevailed nothing else was In fact, all the mistakes and experi- trange as it may seem, have each and helped towards a riper idea of what ilding should be. Architects to-day reater regard for humane needs. They king honestly to produce works which llectual, inspiring and purposeful, and they are approaching the truth that s should be chaste and refined and ely cold evidence of scholarship or skill in producing something picturesque. There are, of course, many view-points, but, nevertheless, there are signs of closer fellowship, and it is this spirit which must be encouraged rather than that feeling of antagonism and disparagement which a few years since was only too common. Such is the function of the Council of the Architecture Club and the Council of the Royal Institute of British Architects.

It is impossible after viewing the Exhibition to feel that it is entirely representative of British endeavour in the sphere of building to-day. Many prominent architects have not availed themselves of the opportunity to show their works. Again, some attempt should have been made by those responsible for the Exhibition to group the works in definite space: for example, the civic works might have been separated from those of domestic interest.

There are four hundred and sixty-three exhibits, and space precludes a mention of each. Among the buildings shown, that designed by Mr. E. C. Frere, No. 154, for the General Medical Council, Hallam-street, W., has the merit of combining scholarship with vivacity, as also the detail of the doorway, No. 155, for the Dental Board of the United Kingdom. The Faculty of Arts Building, University of Manchester, by Messrs. Percy S. & J. Hubert Worthington, reveals that English architects can produce work of a scholarly nature that competes with past masterpieces, and owes little to second-hand classic. Messrs. Buckland & Haywood show an interesting treatment of a manufacturing block for Messrs. Cadbury at Bournville: some of the details are a little too interesting, but the purpose of the building is undeniable. Messrs. Harvey & Wicks exhibit Edwards' factory at Birmingham, a frankly modern but pleasant design for a utility building, and also show a convincing country house. Of the modern work, one of the most striking examples is the open-air school at Welwyn Garden City, No. 176, by Mr. L. de Soissons and Mr. A. W. Kenyon, and Dr. Furnivall's house. Mr. de Soissons and his partner have determined to be modern in the truest sense of the word, and do not disdain the qualities of old work. Mr. Robert Atkinson shows St. Catherine's Church, East Acton, W., No. 1, a building of simple charm developed from a logical plan to meet ecclesiastical needs. In such works as the foregoing is to be seen the line of development of British architecture. Mention must be made of Welsford House, Wilts, No. 76, by Messrs. Detmar Blow and Fernand Billery; of Briant House Cholsey, by Mr. Edward Warren, No. 77; of Nether Swell Manor, No. 96, by Mr. Guy Dawber, and of No. 18, Carlton House Terrace, by Messrs. Oswald P. Milne and Paul Phipps. In this design the authors demonstrate that modern taste for interiors can compete with and surpass historical examples. Regarding lay-outs on a large scale mentioned at the beginning of this account, the photograph of a drawing of the Egyptian State Hospital and Medical School, No. 254, by Nicholas and Dixon-Spain is an outstanding example of skilful grouping.

In the sphere of ecclesiastical architecture the exhibits include such works as St. Martin's Church, Epsom, by Sir Charles Nicholson, No. 292; St. Peter's Church, South Croydon, Memorial Chapel, by C. M. Oldrid Scott; St. Paul's Church, Derby-lane, Liverpool, No. 298, by G. Gilbert Scott, R.A., a work of superlative merit; and the delightful Chapel of The Thistle, St. Giles, Edinburgh, No. 304, by Sir Robert Lorimer, A.R.A.

Coming to the work of other Academicians, we have examples by Sir Aston Webb, P.R.A., the refronting of the Carlton Club, by Sir Reginald Blomfield, R.A., and designs for Heathcote, Ilkley, and Papillon Hall, Market Harborough, by Sir Edwin Lutyens, R.A. Sir John Burnett, A.R.A., & Partner show the completion of the British Museum, one of the finest examples of modern classic, and the Institute of Chemistry in Russell-square, Nos. 324 and 325. Mr. Herbert Baker exhibits photographs of his work at Delhi, Nos. 195, 196, and 198, and the interior of Pretoria Cathedral. Among other works that call for study are such as the entrance doorway to the District Bank, Ltd., Lord-street, Southport, by Messrs. Francis Jones and H. A. Dalrymple, and Messrs. Adshead and Ramsey's work at Kennington for the Duchy of Cornwall estate, which is well known to architects and the public by reason of its refinement and simplicity.

There are examples of recent works by Sir John Simpson and Maxwell Ayrton, Messrs. Briggs and Thornley, Hennell and James, Henry M. Fletcher, Arthur Keen, and Philip Tilden, and nearly every architect who has won fame in the lists is represented.

In Gallery LL will be found examples of recent Canadian architecture which in a neighbourly mood shows friendliness towards American methods, and it is apparent that such architects, to name a few, as Messrs. Darling & Pearson, Ross & Macdonald, Nobbs & Hyde, and Brown & Valance have been influenced by contemporary work in the States. On the contrary, the new Parliament Building, Winnipeg, by Mr. Frank W. Simon, owes little to the States, and yet is an example of dignified classic finely treated. It is a pity that the exhibition does not include a comprehensive set of photographs and models of the vast works now nearing completion under Sir Edwin Lutyens at Delhi.

To sum up this inspection of the exhibition, the works shown prove that with the awakened sense for sympathy and collaboration amongst professional men there is no loss of self-respect or neglect of individuality. It is obvious from the designs shown that the tendency is and will continue to be in the direction of slow and sure development. Building in this country is finding its sure platform; it is coming into its proper sphere as a scientific art, in spite of the winds that blow and fashions that change from year to year. British architects want the truth and nothing else will satisfy their instinct. As a nation we have for a long time suffered the arts to become of secondary importance. We have waited, perhaps too frequently, for inspiration to arrive from other countries. This is a danger to be guarded. It is all very well to speak or write of the cosmopolitan spirit, but useful as Esperanto is, it is not an elegant or a national form of speech. Neither must British architects as in the past place too great reliance on scholarly renderings of the antique. Western art is admittedly intellectual, but this is no argument in favour of that cocksuredness that tends to envelop building in a Classic or Gothic shroud. Present day work should incorporate all the qualities of the past, but greater regard should be paid to the traditions of the moment. Rather than revealing copy-book precision, buildings should express realities in a complete and tidy manner. The true builder must never exhibit his knowledge of style, period, or personal regard for a past master. On the contrary, he will be at pains to conceal his knowledge. Neither should he descend to modish tricks or being unduly influenced by passing crazes in other lands. There can be no doubt of the wonderful advance made in planning both for buildings great and small. The weakness is that people still attach too much importance to style and all unknowingly work against their own buildings being stylish in the highest sense of this somewhat invidious term.

We must regard the exhibition, good as it is, as a stepping stone to better things. British artists are doing much by collaboration to remove the stigma our foreign friends attach to art in this country. We have our own salvation to effect, and the fact that architects are striving towards an ideal is one of the signs that the nature of the ideal will in a very few years be apparent both to the profession and the public.

H

CORRESPONDENCE

Amalgamation.

SIR,—I should like to thank Mr. Keen for explaining so satisfactorily what to me seemed such a grossly unfair state of affairs in the Institute.

It seems to me to emphasise the more the necessity of keeping the status of the Institute to the high level which has been obtained after many years of striving, and those who would have amalgamation with the Society are simply reducing this status to what it was twenty years ago.

M. A. POWELL.

Registration.

SIR,—While our more fortunate brethren with practices are keenly debating which class of "attached" architects shall wear the brightest crowns in the promised architectural millennium, it would, I am sure, interest hundreds of your readers (who are "merely assistants," unattached, and often "unhonoured and unsung"), to know how they will fare under the proposed scheme of registration. Any scheme which ignores the assistant would be antagonistic to the spirit of justice and equity.

An application for registration from an assistant should be capable of being "backed" by independent persons who can vouch for the man's training and experience, thus eliminating any chance of "black-balling" by prejudiced employers.

ARCHITECT'S ASSISTANT.

[**We understand that it is the intention of the Council to provide for the position of assistants in the proposed scheme of registration. The Architects' and Surveyors' Assistants' Professional Union will probably be consulted in the matter, and the Council have announced that they propose to suggest the addition of a regular representative of the Union to the R.I.B.A. Council. This certainly ought to meet the points made by "Architect's Assistant."—ED.]

Cost of Allied Societies.

SIR,—With reference to Mr. Percival M. Fraser's letter published in your issue of the 16th, there is one point on which he is misinformed, viz., the cost of the allied societies to the Royal Institute. Whereas Mr. Fraser gives this figure as £400, according to the Council's report for this year it is £874 19s. 1d.

T. LAWRENCE DALE.

[**We believe that Mr. Dale is correct in pointing out Mr. Fraser's error. The rebate to the Allied Societies is made under By-law 81. The increase in this figure in recent years is a welcome indication of the healthy development of the societies and their closer touch with the R.I.B.A.—ED.]

The R.I.B.A. and Education in India.

SIR,—I have the great pleasure in supporting the letters, one by Mr. Chitale and the other by Mr. Khan, regarding "The R.I.B.A. and Education in India," and I quite appreciate the views of the technic they have put in their arguments. I would like to add some more information in order to make it more clear.

It has already been pointed out that two hours' study in the morning school is not sufficient for the architectural education. The scheme which has been suggested by Mr. G. Wittet, the late Consulting Architect to the Government of Bombay Presidency, in the year 1912, and approved by the Government of India, has not yet been carried out on account of the insufficient fund. It would be of great benefit to the country if the school authorities can influence the Government to open the whole time school where students can develop the freedom of thoughts and expression during their training, as are followed in other parts of the world.

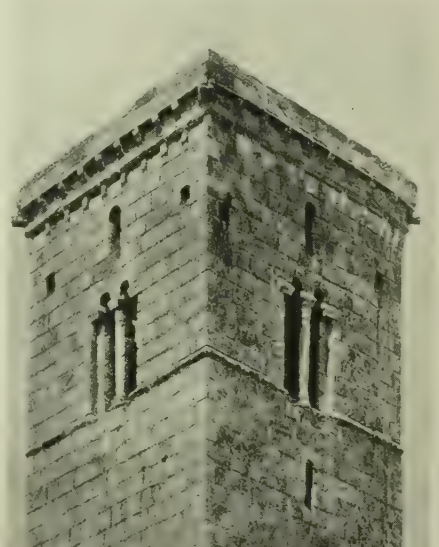
The school authorities do not make any arrangements for passing the students into offices, but each individual has to find out the vacancy. Some of them sometimes remain without employment but simply attend the morning school lectures. It is suggested that the students should utilise the rest of their day by entering into offices for their practical experience which is considered as part of the training.

As regards the school excursion, I may point out that only selected candidates, sometimes six out of twenty candidates from the final year of School of Architecture, and six from painting school, are taken once a year by the school authorities to one of the places such as Delhi, Agra, Bijapur and Ahmedabad. All candidates from the final year class do not derive the benefit of studying the best examples of Indian architecture, as mentioned by Mr. Khan in his letter.

Looking at the result of the ex-students of the different schools, they are no doubt doing responsible services as the principal assistants under qualified Western architects all over India.

In conclusion, I may be allowed to say that the question ought to come before the International Congress, and the R.I.B.A. could use its influence on the Government of India by suggesting to them how to carry out the past approved scheme which has been pending for a considerably long period.

London.



SAMSON A. ELIJAH.

Architectural Competitions.

SIR,—I was particularly interested with the illuminating letter by E. S. in last week's issue of *The Builder*, as I have always marvelled at the willingness of architects to supply costly sets of drawings in competitions for the small chance of obtaining premiums or the work required, and you have done me the favour of publishing my letters protesting against this unreasonable and pernicious custom which has for so long been taken advantage of by those who are not disposed to employ recognised specialists.

Architects are naturally anxious to secure ample and profitable work, and competitions fairly and reasonably conducted have the advantage of bringing out the talent of unknown men. Plans of each floor and front elevation in pencil ought to be sufficient to prove the ability of the architect for the work, which, as it could be done at small cost, would be more willingly supplied, and from these drawings a number should be selected, as suggested by E. S., for the prizes and work. The Council of the R.I.B.A. would render a great service to the profession if they would take this matter up, and put a stop to w become a recognised and approved cus notifying promoters and competitors th pencil sketches should be provided for nary competitions.

The Fine Arts Commission.

SIR,—A question asked recently in Par in regard to the newly-formed Commis Fine Arts, in reference to the criticisms have been rather freely directed agains some quarters and suggesting reconsidera to its continuance, does not perhaps se sufficiently clearly the doubts which ma as to its effective usefulness. We may that the national health in regard to art does not enable us to dispense with the and there is no doubt that this invali may require special treatment. But recognising any cure as easy through organisation, and the general belief in mac we must be sure that there are amon persons altogether free from the defe servable in public life, and that to place in their better hands will be an in remedy. This confidence in the exemp certain specially endowed persons fro defects in the body politic may be war but there must be a very general support view that they are free from it. It is w come against these considerations the arises. Can we by searching find ou infallible? Will the public who are so un choose the artist, choose the expert? not the case the expert has a way of ch himself. There is a great reaction in the from the claims of mere reputation and success; it is not desirable at this ti accentuate this through over-insister decorated infallibility. These conside complicate the situation and give force doubt growing amongst us as to whether organisation and machinery help us very Can we say that on the evidence the less di choice of the public has proved a worse than that of the more elect? In any case, these doubts have in recent times gro importance, are not such forms of protect variance with the freedom of the arts, them subject to the rather contracted int tations of taste and precedent so mu variance with its catholic and noble spirit

MEETINGS

FRIDAY, *May* 30.

Town Planning Institute.—Mr. L. W. on "Reservation of Lands, Open Spaces At 92, Victoria-street, S.W.1. 6 p.m.

THE PRIME MINISTER ON ARCHITECTURE

THE RIGHT HON. J. RAMSAY MACDONALD, the Prime Minister, was the principal guest at the sixth dinner of the Architecture Club, held at the Hotel Cecil on Friday last week. The President of the Club, Mr. J. C. Squire, occupied the chair, and amongst those present were His Highness Prince George of Russia, Baron Palmstierna (Swedish Minister), Mr. H. T. Buckland, Mr. H. P. Cart de Lafontaine, Mr. A. B. Colls, Mr. Ewart Culpin, Mr. W. R. Davidge, Mr. A. J. Davis, Mr. E. Guy Dawber, Mr. C. F. W. Dening, Mr. W. Reid Dick, Mr. Rudolf Dircks, Mr. J. H. Elder-Duncan (secretary), Mr. G. Topham Forrest, Mr. W. A. Forsyth, Sir George Frampton, Mr. J. A. Gotch (President of the R.I.B.A.), Mr. H. Austen Hall, Mr. Stanley Hamp, Mr. E. C. Hannen, Mr. Cecil Harmsworth, Mr. E. Vincent Harris, Mr. Lewis Hind, Mr. P. Morley Horder, Mr. Ralph Knott, Mr. H. V. Lanchester, Mr. Gilbert Ledward, Mr. Edward Maufe, Mr. H. P. G. Maule, Mr. A. A. Milne, Mr. H. Greville Montgomery, Sir Frank Newnes, Mr. Paul Phipps, Mr. A. R. Powys, Mr. S. C. Ramsey, Professor A. E. Richardson, Mr. Howard Robertson, Professor W. Rothenstein, Sir Philip Sassoon, Sir John Simpson, Mr. A. Dunbar Smith, Mr. Harold Stabler, Mr. W. Harding Thompson, Mr. Philip Tilden, Sir Charles Walston, Sir Lawrence Weaver, Lord Gerald Wellesley, Sir Owen Williams, Sir Robert Witt, and Professor J. Hubert Worthington.

After the loyal toasts, the CHAIRMAN said he was especially happy in that they had with them that evening some representatives of Sweden, and he urged those who had not yet seen the Exhibition of Swedish Architecture at the Galleries of the R.I.B.A. to pay a visit before it closed.

THE PRIME MINISTER, in proposing the toast of "Architecture," said he supposed he was there for one or two very simple reasons. The first was that he was very much interested in architecture; the second, which was perhaps explanatory of the first, was that long before he dined with the gods at 8.30 in the evening he supped with the muses at midnight, and at those suppers he acquired an interest in the things which were beautiful to the eye and comforting to the mind. He had no intention whatever, although the temptation was perhaps severe, of disturbing the calm enjoyment they had had that evening by talking about controversial topics. At a meeting such as that not long ago a friend of his was bold enough to make the suggestion that all the public buildings in London should be faced with glazed tiles. Another colleague of his was, he believed, foolhardy enough to give his opinion in favour of building a bridge over Piccadilly-circus, and two or three members of Parliament had found they had good taste for the first time in their lives and were bothering him about the proposed new St. Paul's Bridge. If he discussed those controversies at all he would do it in private, and not in public—that evening he would keep to the harmonies. The toast he was proposing was to be responded to by Mr. Gotch, one of those faithful and devoted servants of architecture who had looked into the past as well as contributed something to the present. He did not know whether Mr. Gotch had been so modest as some writers on architecture who refused to claim that architecture was the first of all the arts; but he (the speaker) did claim that position for architecture. They were told that architecture did not begin until a definite and conscious sense was superimposed upon utility. Utility had never in the whole history of humanity been dissociated from a desire to do something that was beautiful as well. The first architect, the forefather of that Club, was the simian gentleman who, paying attentions to a simian lady upon a somewhat warm day, broke off a bough which he selected not merely because it was convenient to protect her head from the searching rays of the sun but because he felt it was the best and most attractive bough on the tree. That was the beginning of architecture—spiritually and historically, that simian was the father of their Chairman; the forerunner of Mr. Gotch; the raw material from which the knights who built Wembley had been fashioned. Not only was architecture the first of all the arts, but it was the most omnipresent of all the arts. If he wanted to buy a good picture he found that a rich American was stepping in front of him, and he could not have it; or it might be that a wealthy person not American would buy it in front of him and transfer it to that harem which he called his private picture gallery. It was a most extraordinary thing that private enterprise in the collection of art seemed to have a predominating idea similar to that of the Mohammedan who discovered a beautiful lady and immediately appropriated her and locked her up. The other arts were purely individualistic. His heart was with the arts which were social. He was sorry to say that even in the choice of his house he had no free will. If he wanted to have a door which welcomed him every time he put his latch-key into it, he had not the liberty to select it. If he wanted a house which beckoned to him every time he turned the corner of the street in which it was situated, it was out of the question. Every decent God-fearing man declined to buy ready-made clothes—was it not, therefore, a much greater sin to live in a ready-made house? For, after all, a house was clothing. But if he could not take advantage of free will in the choice of his pictures, his door, or his house, there was one thing he could do—he could enjoy the streets of the town in which he lived. That was where architecture came in as a great social art. There were some things in London which he had passed for the past thirty years for which he had never a kind word, never a kind thought. And he di like that. That was why he hoped arch would form an association that would some revolutionary methods and give hi pleasure of finding one morning that buildings did not exist! There undoul the Government came in. They had a great responsibility. His great test of ernment responsibility in building was: I feel happy, can I get a cheery smile, feel a spiritual welcome every day I p building on my way to business?" would tell them a secret he (the spe hoped Mr. Baldwin would not object to. before he (the speaker) came into offi was consulted about a certain comm which was set up to look after monur and big buildings and that sort of thing he said, "For goodness sake appoint it I come in." He was perfectly certain Committee was composed of the most w gentlemen who could have been selected he was not at all sure but that he wou good service if he supplemented it wit other: whether he should not appoint a mittee of artists, architects, and men-perhaps women too—of good chaste eye could appreciate a beautiful thing when saw it. He would charge that committe with the power of creating something but from the annual estimates voted by liament he would give them a good sto dynamite and allow them to use their d tion in employing it to clear the way creations that would give people pleasure and would benefit the comm more than happened at the present time the great point was this: What coul Government do for architecture? He wa of those in favour of getting his letters his pencils sharpened, and his doors o by bureaucracy; that was the job of bu cracy. But when it came to matters of tecture and such things bureaucracy wa of place—it was too stiff, it became too s An artist who became a bureaucrat beca cog in a machine. Spontaneity, the heart to welcome anything new, was

Melrose Abbey: Choir from S.W. (*See p.* 867.

erefore he was opposed to bureaucracy. e Architecture Club was composed partly professional architects and partly of the rons of architecture—the lion and the mb—and that evening they were sitting wn in holy harmony together. He would ggest to the Club that it could do no better blic service than by helping him out of difficulty. "How can the Government p architecture; how can the Government p art?" His conclusion was that perhaps only possible way just now was for the vernment to be a patron of the arts, leaving architect free to do his untrammelled t, and even then there would be many a between the cup of idea and the lip of omplishment. But nevertheless, when they ked on those old buildings which delighted m so much it was perfectly clear that the blic had been an essential element in the elopment of art. He would like the public ron to do more than he had done. He uld like to be assured that not a public ilding, however small, would be put up in country without it would be possible for n and women of good taste to take angers to look at it without being ashamed it. He did not want public buildings to more extensive; he did not want them to great, huge, vulgar things; he did not nt them to impress by immensity alone, he nted them to impress by their chastity, by ir spiritual correctness. If architects bore t in mind they might design plain walls or orated walls; the effect would be the same, the citizens would be proud of the spirit their country as embodied in the buildings the country. He asked them to drink to Architecture," the oldest of the arts, the st omnipresent of the arts, the art which its completeness, its wholeness, most com-hended the human spirit because it pro-led the place in which the human spirit uld dwell. And in giving the toast there s no name he could more appropriately sociate with it than the name of Mr. Gotch. one had given more opportunities to the ng architect to get a grip of tradition, and thout tradition architecture was dead.

In responding, Mr. Gotch said he was te sure they would all agree that the Prime nister had a great grasp of architecture, that he had treated the subject in a very cerning manner. They would all agree h the view of their art taken by the Prime nister. In the matter of the connection be-en architecture and the press, he would ad for a dignified treatment of the subject, e from the chatty interview and from any-ng likely to lead to the advertisement either the architect or of the materials he used. treating of architecture it seemed to him principal matter was the building itself, not the personality of the architect, or opinions, or of the materials employed the ing of which might be the purpose of the erview. He would not presume to suggest best means of gaining the ear of the blic, but one of the ways in which it might done was by bringing home to the public human aspect of architecture. And by human aspect he did not mean the ap-rance of the architect as distinguished n his architecture, but rather the forms ch architecture had taken in the past, and took, to comply with human needs and res, or the forms to which it had been ught by the force of strong emotion or found thought. Of the two great styles of itecture familiar to them in the West, hic appealed to the emotions and Classic the intellect. The worshippers in Gothic edrals were not drawn to them by pure on, or by a desire to have their intellec-doubts resolved, but by worship to be paid some great uncomprehended power, by to be expressed, by grief to be assuaged, guilt to be confessed and pardoned upon ns. And so these buildings produced in kind, according to his mood, now un-akable awe, now exultation of spirit, e of mind, or suggestions of mystery ond human knowledge. They followed no t rules of proportion; here they were

St. Rule's Church, St. Andrews.

narrow and lofty, there they were low and broad; here they soared to heights incalculable, there they stretched out into infinite perspective. But emotions could become exhausted. Europe, wanting a fresh stimulus, proved restless, and then came that great awakening which was termed the Renaissance. Knowledge now strove within the people; the mind furnished the heart; the mind kept the emotions in check. No longer was architecture to be subjected to a kind of inspired fancy. Under the guidance of devotees filled with a knowledge of ancient Classic architecture, she submitted herself to strict rules of proportion, to the symmetrical arrangement of her features, to a carefully calculated striving after lofty ideals. Her appeal was indeed to the intellect rather than to the emotions, which found their outlet in more mundane channels. From that very fleeting glimpse of architecture in one of its human aspects, he might pass to a brief glance at one of the directions in which it had complied with human needs. Probably they all knew of some tower built upon a crag or poised upon a ridge. But the romance or desolation of such buildings formed no part of the original conceptions; those buildings, which were the homes of our ancestors, were placed in their positions for the purpose of security, and the same purpose controlled their appearance, which was very little more than a mass of masonry. Their chief concern was to get a home which would offer resistance against determined attack, and for centuries that need dominated the architecture of the house. But as law and order grew the need for protection grew less, until it almost vanished in the time of Elizabeth. So the mansions of Elizabeth's time were full of windows, and they stretched themselves abroad. They cast away defence as of primary importance, and, in the words of Sir Thomas More, their size and arrangement were directed to increased refinement. Sometimes the houses of the time were a tribute to the Queen herself and to the desire to house her adequately on her numerous progresses. Then these mansions of Elizabeth's time fled from their visions; their great gables, their long parapets, their huge chimneys, and their mullioned windows disappeared into thin air, and the picture emerged of a great house with two outlying wings. Its columned portico, its sash windows, its colonnades, produced a vista which struck the beholder with wonder and admiration—and well it might, for that was one of the mansions of Queen Anne's nobles, "for whom the world was made and the fulness thereof." Again, at a respectful distance, set within a rural garden or placed hard on some street as it left a country town, was a red brick house, modest yet substantial. This was a development of architecture consequent upon the definite emergence of the middle classes, an emergence marked by an increase in the number of merchants and maiden ladies of independent means, who all housed themselves in such ways. A whole gallery of similar pictures might be drawn, some with fuller colour, some subtler in detail, but all showing how architecture had always reflected social changes, and how behind its grave and impassive front there was an abiding and vivid human interest.

After the Chairman had said a few words, the toast of "The Club" was proposed by Mr. George Whale and responded to by Mr. R. M. Barrington-Ward.

MELROSE ABBEY

Mr. A. Ling lectured recently on this subject before the Partick Camera Club. In the course of his remarks he said Old Melrose was founded early in the seventh century, during the reign of Oswald, the Anglo-Saxon King of Northumbria, and Aidan was its first bishop. About the year 651, the brethren of old Melrose were joined by Cuthbert. In the year 839 Old Melrose was burned by Kenneth II, King of the Scots, upon his invasion into Saxon territory, and they read that in the year 1050 Old Melrose was a ruin. From about this time it was referred to as only a chapel dedicated to St. Cuthbert.

Of the 1136 structure nothing was said to remain, Edward II having wholly destroyed it during his various inroads to Scotland, and for this and other barbarous acts he was severely punished by King Robert the Bruce at Bannockburn in 1314. Bruce, before he died in 1329, granted a sum equivalent nowadays from £30,000 to £50,000 towards the rebuilding of the Abbey, and the structure they saw to-day was believed to be representative of the Abbey thus built. It was built in beautiful Decorated and Perpendicular Gothic styles; the tracery of many of the windows still formed glorious examples of these periods of architecture.

In the year 1385 King Richard II and some of his generals slept one night in the Abbey and then set it in flames. There were depredations by Eure and Latoun in 1544–5 and they also slept a night in the Abbey and set fire to it. The Abbey never recovered from this last blow. In 1618 a portion was roofed over and some plain rubble arches were erected up against the beautiful Gothic arches of the north aisle to support the new roof, and those unfortunate arches, while no doubt serving their purpose of keeping three bays of the nave intact, had obscured some of the charming carvings and mouldings of the capitals of the arches against which they were built. Melrose Abbey contained many of the finest examples of mediæval sculpture, but the iconoclast, with few exceptions, cast those down, as they were assumed to pertain towards imagery. Some fragments, however, still remained and there were one or two fairly complete examples. For instance, in niches in two of the several pinnacles of the nave they saw a representation of the Virgin and Child and St. Andrew with his cross, and within the west wall of the North Transept were St. Peter and St. Paul, and at the apex of the eastern gable were King David and his wife. Those, however, were all that remained of fully 70 statues. The Abbey contained a wealth of excellent architectural detail and formed a fine example for the student of architecture. To the lay visitor the carvings were really arresting and were much admired by Sir Walter Scott. He wrote regarding the cloisters: "Nor herb nor floweret glistened there but was carved in the cloister arches so fair." There were, of course, other famous carvings such as the "curly green" or "Scotch kail" capital, and the beautiful carved hand clasping the twig of vine, to mention only a few of them.

ILLUSTRATIONS

Hudson's Bay Company's New Offices.

This illustration, from the exhibit in this year's R.A. Exhibition, shows the central feature to the Hudson's Bay Company's proposed new premises, Nos. 52–68, Bishopsgate, E.C., incorporating an entrance to a private road to St. Helen's-place.

The Trust Royal Charter having been granted to the Company by King Charles II, in 1670, it was decided to adopt a treatment reminiscent of the architecture of that period. The building will be erected in steel framing encased in Portland stone, and surmounted by a high roof covered with Westmorland slates. The elevation shows an order of Doric pilasters and columns, with an enriched entablature, rising from the ground floor to the level of the second floor, on which will be situated the offices of the Hudson's Bay Company. The upper floors will be occupied by tenants. The building will be crowned by a richly-carved cornice and balustrade of the period. A feature is made of the entrance to St. Helen's-place, which will be closed at night by ornamental iron gates bearing the arms of the Leathersellers' Company, who are the freeholders of the property.

Messrs. Mewès & Davis, FF.R.I.B.A., are the architects; and Sir Charles Allom the consultant.

Sloane Telephone Exchange.

This building is an automatic exchange, being erected at the corner of Sedding-street and Sloane-terrace, adjoining the church erected from Mr. Sedding's designs. Our illustration is from the exhibit at the Royal Academy Exhibition.

All the stonework is in Portland, and the brickwork is to be finished with facing bricks supplied by Messrs. Thomas Lawrence & Sons, of Bracknell, Berkshire. The balcony over the entrance is to be in cast-iron with the Royal Coat of Arms as a central feature. The contractors are Messrs. Higgs & Hill, and the steelwork is being done by Messrs. Dorman Long & Co. The architect for the work is Mr. John H. Markham, F.R.I.B.A.

Modern Architecture Exhibition.

A review of the Exhibition of Modern Architecture at the Palace of Arts, British Empire Exhibition, is given on p. 863; and in this issue we give a selection from the exhibits.

Domestic Chapel, St. Wilfrid's Church, Preston.

The interest in this chapel, which was designed by Messrs. Romaine-Walker & Jenkins, architects, depends not only on the carefully executed detail, but to a great extent on the colour scheme. The whole of the panelling is in Italian walnut, the upper carved panels of which are pierced, revealing a background of rich deep blue. The ceiling is treated in the Raphaelesque manner, the richly coloured ornament being hand-painted on a soft yellow ground. The altar is in statuary marble, with panels of convent sienna, bordered with gilt mouldings. The apse is lined with pale sienna, with columns in breccia. The semi-dome over the apse is executed in gilt mosaic interspersed with tesseræ of blue, green and red, the same colours being introduced into the pattern forming the archivolt.

The contractors for the structural alterations were Messrs. R. Park & Sons, of Preston; panelling by Messrs. H. & A. de Wispelaere, of Bruges; marble work by Messrs. H. T. Jenkins & Son, of Torquay; painted ceilings by Mr. F. G. Christmas, of West Brompton; mosaic work by Signor Gaetano Meo; heating by Messrs. John Metcalf, Ltd., of Preston; and electric light fittings by Messrs. C. B. Davis, Cash & Co.

EXHIBITION OF ARCHITECTURE AT WEMBLEY

THE Exhibition of Modern Architecture at the British Empire Exhibition was opened on Monday, and remains open until July 5.

In opening the exhibition the EARL CRAWFORD said it was good that the art the architect should occupy so prominent place in the palace devoted to the arts generally, a position that all artists would read give to the mother of the arts—architecture. There were some 450 examples of the work of no fewer than 300 architects from the United Kingdom, Canada, India, and South Africa. All styles, all ambitions, and objectives were included, and they all showed that as time went on those who occupied commercial or business premises were coming to realise that for distinction, and perhaps also success, the more they enlisted the services of a well-qualified artist the more likely they were to do credit to themselves and to the community in which they lived. He hoped the exhibition would make a successful popular appeal, for it represented the effort, progress, and, he believed, the stability of the art of architecture. There was plenty of scholarship and plenty of originality, too. Personally, he did not look upon originality in architecture as an end or objective in itself. Those who tried to achieve originality merely because they despised the past rarely produced anything worthy of the present. The exhibition showed a considerable amount of achievement which drew its inspiration from overseas. In spite of that, there would be found respect for old traditions as well. On all it was really a British national exhibition. It was essentially British, showing the strength of the British ideal tempered by the wisdom of the past, and drawing a lesson from all that was most fruitful in our own day. That was something they wanted to foster and stimulate architecture. He also referred to the fact that there was a general absence of plans, and that the exhibition, perhaps rightly, relied on photographs for its popular appeal.

In moving a vote of thanks to the Earl of Crawford, MR. J. A. GOTCH, P.R.I.B.A., pointed out that from the point of view of the architect plans were necessary to a proper reading of the building.

The vote of thanks was seconded by SIR LAWRENCE WEAVER, and carried with acclamation.

UNITY AND REGISTRATION

Mr. Horace R. Appelbee writes :—

SIR,—Part of your footnote to Mr. Frank Heaven's letter surprises me. You say of the "unattached architects,"

> "They have much to gain and nothing to lose by Registration . . . but, as we understand the position, there is no question of admitting them to the R.I.B.A., and no need to do so."

As one of the "unattached," I should like to know, not merely "the much," but any little thing that I can possibly gain—the loss I see clearly enough. Membership of the Institute (as a Body for the Study and Advancement of Architecture) is of the greatest value. The use of the Library and other facilities at Conduit-street, the meetings to hear the views of the masters of their work, the exchange of views among those who have been in the profession some time, the help and encouragement of the student, are all most desirable features. Registration without these, but with the implication that the qualification for Registration is insufficient for membership, is not merely useless but damning to the "outsider," unless he has already done work of importance. Something of the same sort happened when the Lic. class was created, but then many joined it under the mistaken impression that if they did not, then, in some wonderful way, they would be prevented from earning a living as architects. One of my friends who joined under this misapprehension was so ashamed of the "distinction" that it was ten years before I discovered his name on the roll, he was most careful never to mention it to anyone.

The attitude of the Institute on this Registration question has always been incomprehensible to me. It seems to be based on attempts to compromise between conflicting and established interests and jealousies, instead of being based on elementary principles, and it can do no good until that fact is realised.

The fundamental principle of useful Registration is that *all* (without exception) properly trained and qualified men are on the Roll, and that the Roll does not include any unqualified.

In order to focus the matter, let me take three names (with apologies to their owners) :—

> (1) *Ralph Knott.*—In 1908 he won the competition for the new County Hall. Five years later, when the work had started, he was not on the Institute Roll, either as F., Assoc., Lic., or Stdt. He was, of course, one of the younger men.
>
> (2) *C. F. A. Voysey.*—His name does not appear. For many years he has been a well-known designer of buildings of simple character, and also of furniture and fabrics.
>
> (3) *Baillie Scott.*—Who does not know the character of the work he has done ? His name is absent from the Roll.

Please let us have a plain answer to a plain question. Are these men architects or are they not ? Are their works sufficient to justify the title, or must Mr. Voysey (for example) prove his ability by calculating the weight per foot run or the least radius of gyration of an R.S.J., of which the scantlings are given, before he is accepted ?

What is wrong at the Institute that it shuts its doors to such men as these and opens them to District Surveyors, who may not practise as architects, or to expert witnesses in light and air cases, or to young men who draw symmetrical elevations to unsymmetrical plans, who balance the R.W.P.s and give them beautiful heads and at the same time put the w.c. over the front door and forget the S.P. and its head ?

As the Institute wants to force something on "outsiders," perhaps an "outsider" may retort that it should first put its own house in order and clear up some of the muddle that has accumulated during recent years. Fifty years ago it was a Learned Society for the Study and Advancement of Architecture and (I think) admitted laymen ; anyway for twenty-five years its President was Earl de Grey, who, I suppose, was not a practising architect. It has now shut its door to the layman and it has done more—it has shut it to many architects. At the same time, it pretends that all architects should be bonded together. What better way is there than by Membership ? Is it to register them and tell them that they are not good enough for admission ? I for one doubt it.

Registration and Membership of the Institute ought to be synonymous terms, and to combine this with the facilities for which the Institute was founded nearly 100 years ago seems to me an ideal programme. In addition, there would be, as now, the "Student" section leading up to and terminating with the passing of the "Final," but that is an insufficient test of a "fully qualified Architect" fit to be registered. He needs more of the practical business side. Experience as clerk of works is most useful ; broader views gained by travel abroad are desirable ; a post as chief assistant is not to be despised. The first job on his own account will test him as the "final" never did. So that there would also be an intermediate stage. With these three stages the whole profession from the probationer to the President would be organised and the applicants would be "admitted" on production of suitable proof of qualification at each stage.

The whole constitution of the Institute at the present time rests on something very different. The four corner-stones of its foundation are "Election," "Rejection," "Expulsion," "Resignation." A Norman Shaw in the very zenith of his career cannot demand admission. A Soane Medallist and Ashpitel Prizeman may be blackballed on personal grounds. He does not get in *because* he passed the final and was the best of the bunch. He may be expelled if he takes part in a competition of which the Institute does not approve, or other points which have nothing to do with his professional ability, but which are of trade union character. Other rules absolutely exclude properly capable men from seeking admission because they are not "eligible."

The difficulties of Registration by Act of Parliament, of Membership of the Institute, and even of the definition of Architect are well illustrated by the letter (same issue, page 841) from Mr. Stark Wilkinson relative to the Albert Hall, among them :—

(1) Is the Albert Hall architecture ?

(2) If so, was the designer an architect ?

(3) Who was the designer ?

(4) Would he be eligible for registration as architect ?

(5) Would he be further eligible for membership of the R.I.B.A. as at present constituted ?

(6) Would he be allowed to carry out other similar work if the Bill recently proposed by the Institute and outlined in your columns had become law ?

(Perhaps some of those who have recently been through the Final would like to attempt this very simple little paper, and send you their views.)

It appears to me that the Albert Hall is as much architecture as many buildings in Regent-street or Kingsway, and that if the Institute refuses the use of the description "architect" for the designer, it merely limits the use of a well-known word with no advantage, and it could not stop such work from being carried out from the plans and under the supervision of those who were not registered architects.

The designer was a Royal Engineer, either Fowke or Scott, members of the staff of a Government Department, ably assisted by the architect Verity, who probably modified Townroe's sketch elevation to what we at present see, and the building benefited. This apparently would not have been possible under the last Bill (happily defunct) drafted by the Institute, because the Registered assistant would not have been allowed to work for the unregistered chief. Mr. Wilkinson's letter full of interesting points on the registrat question. A Government Department dealing with the surplus produced by 1851 Exhibition, and acquired Gore House esta Captain Fowke made the first sketch for Albert Hall, and this was submitted with prospectus to induce subscriptions. Gene Scott came in after the death of Fowke, a according to Mr. Wilkinson he submitted pl which were approved by the seat freehold and Sir Henry Cole, head of the Departme and it was after this that the private of competition held between "Redgra Verity and Townroe" for "the treatment the bays" took place. Townroe's sket although selected, was not carried out with considerable modification. The great porch materially part of the design as we see it, w apparently suggested by the non-archit secretary. Then, again, the roof outline. it arise in its present form while Townro elevation was being modified ; that is, did engineer responsible for its construction w to a skyline supplied to him by the archite or did it arise as an improvement suggested the engineer ?

All this suggests that it is very difficult say who was the architect, but there is one t —it is the man who receives the instructio (and also the fees) from the client, and w certifies the amount due to the contracto the others are his assistants, although possib they are better qualified men and the finish product owes much to their work.

But to return, who is it that wants t Parliamentary registration ? There are abo 5,000 members of the Institute and Socie taken together. They are already registere and attach an affix to their names to show Why do they want more ? Is it for themselves Is it that they recognise that the registrati they have already is of very little use ? If is valuable I fail to see why they want mo Do they need protection from the incompete outsider ? Do they feel that the public cann see the difference between the rank and file the members and the incompetent and poor equipped outsider ? Is it the poor outsid asking for protection ? Is he constant hammering at the doors of the Institute an Society, begging for admission ? It would natural to let him in if he is any goo (professionally), and if no good why regist him ?

Is the public being so gulled by the outsid that it is begging for protection ? I have nev heard of it, but if they do feel that way the are the 5,000 already labelled whose services ar I imagine, at their disposal.

Personally, I should like to see all trained an qualified architects members of the Institute a right, as a recognition of their ability, an associated with them those in training and th intermediate class as I have described it. Th affix would then mean something definite an the public would soon recognise its value. Pa liamentary powers would not be necessary. Th result would be a great Institute; the keynote recognition of ability. There would be room i it for a genius who has not passed the exam as well as a District Surveyor who knows all abou the Building Act but who must not practise a an architect. There would be opportunity fo the study and advancement of architecture, an the exchange of views between the Surveyo and the Architect on the subject of thirty-sto buildings on the Devonshire House site shou be instructive and possibly lead to the improv ment of the Building Act.

The petty trade union policy now bein pursued by certain sections could be ignored it is unworthy of a great Institute. It shou not be necessary to explain to a member th he should not advertise like an auctioneer, b that it is permissible to announce in the *Morni Telegraph* that the wife of the eminent architc So-and-So, who built the —— has just pr sented him with twins. There will at times regrettable incidents, of course, as in the case the president who was in such a hurry to ha his official portrait painted that he forgot

his coat on! Perhaps he thought the native was academic dress!

ave tried to put my criticism as lightly as n. The many questions are intended to st a line of thought rather than expect an er; the constructive suggestion is but an ne. Once the principle is admitted the follows. The allied societies might be hes of the Institute (within the Empire, elf-governing dominions). Above all, the er of qualified men would not be rically stronger than membership of the tute.

* Mr. Appelbee deals with a number of sting points. He appears to doubt the of Registration. He may be right, but ather late in the day to start afresh on that ion. The profession as a whole made up ind on the subject years ago. The pro- n is now busy with practical proposals for ng it. If Mr. Appelbee would like to know about the case for Registration, he might it interesting to read Major Barnes' ss on the subject, which he will find in R.I.B.A. *Journal* for July 15, 1922. The rience of the United States and the inions, which have had practical evidence he working of Registration, confirms the ion of those in this country who believe it would be of definite practical value to qualified architect.

. Appelbee's principal quarrel appears to be the R.I.B.A. If it were worth his while to the long history of this question in more l he would realise that the problem is not mple as it may appear at first sight. He unces the Council's proposals as a com- ise. That is precisely one of their main ies. There are extreme views on both sides he question and the Council have tried to the middle course.

it generous to attack the R.I.B.A. for not ing a permanently open door, or to quote names of distinguished architects who are members, as though the R.I.B.A. were guilty arrow views in keeping them out? Without into personalities, it is well known to those are interested in the matter that the B.A. urged these distinguished men to join the very terms that Mr. Appelbee suggests. preferred, as they were quite entitled to do, emain outside. How is the R.I.B.A. to ie for the fact?

r. Appelbee says: "The fundamental ciple of useful Registration is that *all* (with- exception) properly trained and qualified are on the Roll and that the Roll does not de any unqualified." Precisely. That, e understand it, is the very object of the B.A. Bill. No Register will ever be oved by Parliament which does not include ualified architects, whether they are mem- of the R.I.B.A. or of any other Society or

But it does not follow that all on the ster should necessarily be members of the B.A. All solicitors are on the Roll main- d by the Law Society, but all those on the are not members of the Law Society. e people will always be content with their ion on the Register; others will desire the ier advantages of membership of the B.A. and allied societies.

e believe that what the profession wants is to make an end of these interminable tments, with which we have been familiar 0 years, and go right ahead with a practical y on which the great majority of the profes- are at one and from which it is possible to for really useful results within a reasonable d.

general discussion of Mr. Appelbee's points d be interesting and stimulating to those have time to spare for it. It would lead to ly interchange of opposing views on a large er of topics, and it would end with our to bed with nothing done. Destructive ism has been the bane of the profession for years past. There is always an ample y of it and it leads nowhere. We have a e now of getting something of practical done for the benefit of the practising tect. Let us get on with it.—ED.]

BOOK REVIEWS

Modern English Architecture. By CHARLES MARRIOTT. (London: Chapman & Hall.) 21s. net.

A BOOK upon architecture written by Mr. Marriott is an event of some importance to the general public and to architects, and let it be said at once that a layman has written a book which will remain as a serious contribution to the literature of architecture. If we find it difficult to classify, it is because books of this nature are rare. Mr. Marriott possesses a profound knowledge and understanding both of the spirit and letter of architectural style, and submits some excellent criticism to justify the contributions he brings to modern thought on English architecture. The sub-division of modern architecture under the chapter headings, Ecclesiastical, Civic, Commercial, Industrial, Domestic, Housing Schemes, Monuments and Memorials, is an arrangement in the book which works out well. The illustrations, which seem to have no particular reference to the letterpress, are, on the whole, well chosen, and it is doubtful if any impartial architect would quarrel with more than one or two of them. We believe that, in his choice of examples, he has unerringly put his finger on one or two buildings which have affected the whole course of modern architecture.

Mr. Marriott, as we would expect, gives us some fine analogies between literature and architecture, although, as he says, there is nothing in literature which compares with the stubborn facts of building. He compares our mixed language with our mixed architecture, and in the choice of words he tells us that most of us, in fact, are Latin for evasion and concealment, and plain spoken about our everyday affairs. "Our houses, which need no evasion, are in the vernacular, but on our public buildings, which represent questionable institutions, and particularly on our big shops, 'Orders are worn.'"

In his opening chapter: What is Architecture? the author defines his architectural doctrine, which, in short, is this: that he makes no distinction between architecture and building, that the simplest building is capable of architectural treatment, and that, though its relative importance may vary with the kind of building and its purpose, the æsthetic problem is present in every building. Few architects will be found to quarrel with these articles of faith. Throughout the book the author is more than fair to the architect: he is generous. He sees the architect struggling against a social state, undecided on many vital things, yet manifesting itself in certain directions which the author contends are opposed to the principles of fine architecture.

Mr. Marriott's criticism of Ecclesiastical and Commercial architecture and War Memorials, and indeed every form of architecture, is based upon his belief that architecture is to a large extent the expression of the ideas and social needs of the age. While theological discussion goes on, the architect is sitting on the fence; we have no single and generally accepted meaning of the war which is capable of monumental expression in sculpture; and in commercial buildings the architect has to take part in a gigantic game of bluff. On all these points Mr. Marriott argues in a skilful and stimulating manner. He is particularly severe upon the modern shopkeeper, and considers that he has acquired an importance in the modern social scheme out of all proportion to his utility. "Commerce to a much greater extent than formerly depends upon advertisement, instead of upon the quality of the goods." There is much to be said for this point of view, though we fail to see how architects can gradate architecture to a set of commercial morals. If we accept the idea that commerce, so long as it is frankly expressed, is capable of satisfactory architectural results, the fact remains that the architecture would always be out of harmony with commercial morals. "Until we ourselves have decided to reform our institutions," he says, "he (the architect), like the diplomatist, can hardly be blamed for speaking about them in guarded language." It is reasonable to suppose that architecture should be sensitive to changes in the social life of the country, and Mr. Marriott deserves credit for raising a fundamental issue which brings architecture as a living art into touch with life. He does not infer that good architecture will result from a close adherence to the social wants of the people; on the contrary, it is his excuse for the mediocre results. Architecture may be this, that, and the next thing; it may be a structural evolution, or its forms and proportions may imitate those of antiquity without any particular regard to the means by which they were produced. We may, if we choose, consider architecture as an effect of which building is the cause, but there are utilitarian and material purposes which are the causes of which building is an effect. We all have arguments to justify our leanings, and we prefer Mr. Marriott's philosophy—although it is not particularly comforting—because it seems to us it does not require academic proof, and places a direct responsibility upon the people.

The decline of craftsmanship, the rise of the professional artist, the use of machinery, and the detachment of the painter and sculptor, are subjects which the author treats in a very entertaining and suggestive manner. He strikes a new note when he discusses Gothic craftsmen and craftsmanship, and though we have become accustomed to the popular conception of the conscientious and inspired mediæval craftsman, we believe that Mr. Marriott's interpretation of history is just as likely to be correct. The obscurity which surrounds the social conditions of the workers of the Middle Ages has been responsible for many economic and industrial theories to try to recapture the joys of Merrie England. This book will help us to see the problem whole.

The author, in discussing whether form and proportion in the abstract, or form and proportion as proceeding from construction and materials, is the true element in architecture, seems to think it better to accept them both as the effects of different artistic impulses. We have the feeling that we are not yet far enough away from the symbolic and ethical architectural standards formulated by Ruskin, when statements of constructive fact were exposed, and understood in terms of natural materials only. Consequently, in a transitional period of thought, an artistic impulse may be based upon principles or even prejudices. If there is anything in our contention, it may have some bearing on Mr. Marriott's comments upon the treatment of modern forms of construction. The so-called "practical man," he says, derives his false ideas of architecture from the separation of use and beauty. He prefers architectural trimmings to structural beauty: he begins at the ornamental end instead of the constructional end. There is a hint in the book that the history of the Renaissance has some share in the responsibility.

Altogether this is an important book, which can be read with enjoyment by the layman and the architect. We have to resist the temptation to quote many provocative but thoughtful sentences which will be numbered amongst the elegant extracts of the architectural literature of the future. We consider that Mr. Marriott has succeeded in submitting a consistent theory of the art of building, and a rational and interesting summary of the modern position.

THE LAW RELATING TO BUILDING

By W. T. CRESWELL, Lic.R.I.B.A., F.R.San.Inst. (*Barrister-at-Law*).

VIII.—OWNERSHIP AND COPYRIGHT OF PLANS.

Previous articles in this series have discussed the architect and surveyor as an agent, the scope of his authority, his rights and liabilities, remuneration, and his position in granting certificates. In the article dealing with remuneration it was stated that "plans, when paid for, become the property of the employer, and consequently he can make any use of them when he pleases."

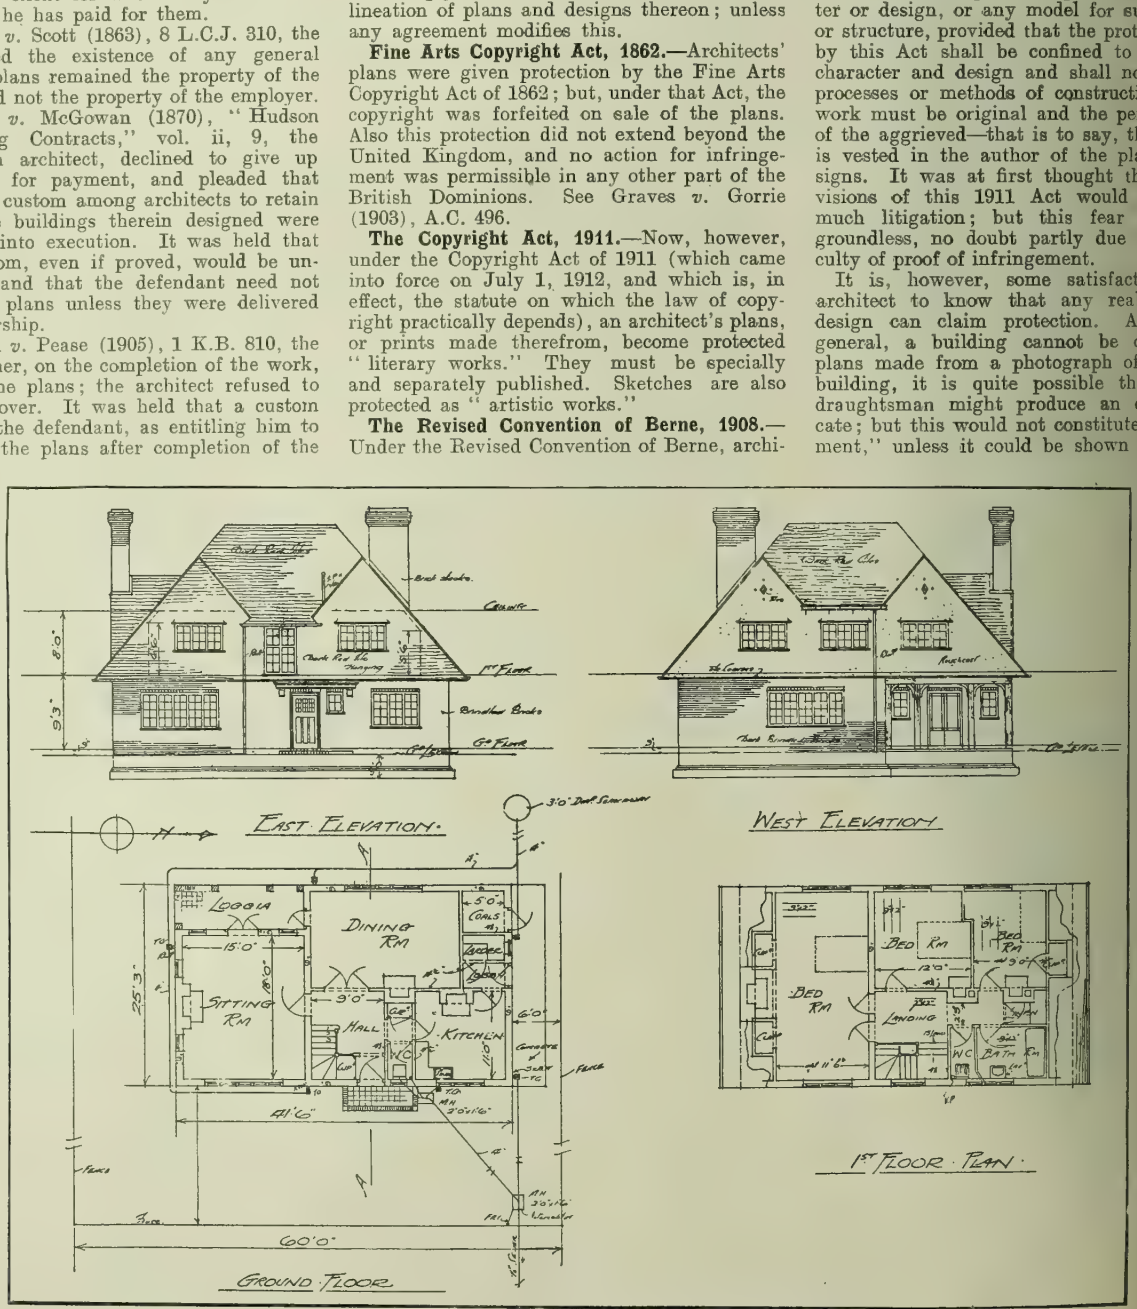
The question has arisen as to how far the truth of this is affected by the law of copyright; or if the purchase of an architect's plans includes the purchase of the copyright. The Courts have repeatedly established the rule that, in the absence of any agreement to the contrary, plans become the absolute property of the client for whom they have been made when he has paid for them.

In Moffat *v.* Scott (1863), 8 L.C.J. 310, the Court denied the existence of any general usage that plans remained the property of the architect and not the property of the employer.

In Ebdy *v.* McGowan (1870), "Hudson on Building Contracts," vol. ii, 9, the plaintiff, an architect, declined to give up plans, sued for payment, and pleaded that there was a custom among architects to retain plans if the buildings therein designed were not carried into execution. It was held that such a custom, even if proved, would be unreasonable, and that the defendant need not pay for the plans unless they were delivered to his ownership.

In Gibbon *v.* Pease (1905), 1 K.B. 810, the building owner, on the completion of the work, demanded the plans; the architect refused to hand them over. It was held that a custom pleaded by the defendant, as entitling him to property in the plans after completion of the work, was unreasonable and afforded no answer to the action.

Conversely, if an employer has made any use of a part, or the whole, of plans drawn by an architect, he must pay for the plans, unless he can prove some express condition excluding such liability. Ownership of plans gives the employer the right to build therefrom, but not the right to make copies, tracings, or other duplications, except for his own use, or for private study; unless the architect has sold to him the copyright, or unless the architect is at the time under a contract of service to such employer. What actually becomes the property of the client or employer is, wholly and simply, the sheets of paper and the delineation of plans and designs thereon; unless any agreement modifies this.



Fine Arts Copyright Act, 1862.—Architects' plans were given protection by the Fine Arts Copyright Act of 1862; but, under that Act, the copyright was forfeited on sale of the plans. Also this protection did not extend beyond the United Kingdom, and no action for infringement was permissible in any other part of the British Dominions. See Graves *v.* Gorrie (1903), A.C. 496.

The Copyright Act, 1911.—Now, however, under the Copyright Act of 1911 (which came into force on July 1, 1912, and which is, in effect, the statute on which the law of copyright practically depends), an architect's plans, or prints made therefrom, become protected "literary works." They must be specially and separately published. Sketches are also protected as "artistic works."

The Revised Convention of Berne, 1908.—Under the Revised Convention of Berne, architects' plans and drawings are inclu amongst the subjects to which all countr parties to the convention, are bound to gr protection. "Publication," as infringem consists in exposing copies of the works sale (one copy so exposed establishes infringement) to the public, or offering s copies gratuitously; also the issue of ph graphs and engravings of such works con tutes "publication"; if architectural dr ings or plans are so "published," an infrin ment exists. Yet, the construction of a bu ing from an architectural design or plan not "publication," neither is the publish of paintings, drawings, engravings, or ph graphs, if taken from the erected buildi within the legal definition.

The onus of proof of infringement lies w the architect. He must first show that work is original and then that it has b definitely copied of intent. The Act of 1 defines an architect's "artistic works" "any building or structure having an arti character or design, in respect of such char ter or design, or any model for such build or structure, provided that the protection gi by this Act shall be confined to the arti character and design and shall not extend processes or methods of construction." S work must be original and the personal eff of the aggrieved—that is to say, the copyri is vested in the author of the plans and signs. It was at first thought that the p visions of this 1911 Act would draw fo much litigation; but this fear has pro groundless, no doubt partly due to the di culty of proof of infringement.

It is, however, some satisfaction for architect to know that any really origin design can claim protection. Although, general, a building cannot be copied fr plans made from a photograph of an erec building, it is quite possible that a cle draughtsman might produce an exact du cate; but this would not constitute "infrin ment," unless it could be shown he had

House at St. Albans. Mr. J. Curtice Ellis, Architect.

[This small detached house is now being built at St. Albans, Herts. Buckinghamshire multi-coloured bricks are used; the roof and front gables are laid with sand-faced tiles; the metal casement and lead lights are supplied by the Crittall Manufacturing Co., Ltd. The ground floors are laid with "Acme" patent wood block flooring; general contractors, Messrs. A. E. Simms, Ltd., of St. Albans. The cost of building, exclusive of fencing and land, is £1,3 Mr. J. Curtice Ellis, of 23, Bucklersbury, E.C is the architect.]

ess to the plans, or had been furnished th measurements taken *in situ*.

If an architect has reserved the copyright in drawings, he retains the exclusive right to nstruct further buildings from those draw-gs. Further, if he has actually parted with e copyright, and his client does not claim ssession of them, he can use them in the rvice of another client, if he varies the main atures of the design, unless he has expressly impliedly agreed not to do so. If the first ent objected when the second structure had arted, his remedy would be an action for Tringement and damages; he could not de-and the demolition of the structure once mmenced.

The period of copyright is during the life-ne of the architect plus fifty years after; d the copyright relative to any individual rtion of a building appears to date from the mpletion of that particular portion.

ELECTRIC LIGHTING IN CHURCHES

On Friday, May 2, Mr. F. H. Taylor, M.I.E.S., M.I.E.E., A.M.I.Mech.E., delivered a lecture "Electric Lighting in Churches," at the nior Institute of Engineers. He said although e switching of transepts, side chapel and stries was local, the switching of the nave, sles, choir and chancel, had to be from the st entrance. It was here also that the main vitch and fuse boards were usually placed. o obtain economy in working and to avoid y large extinction of light, it was necessary r the nave to have its lighting fed from several rcuits. Alternate lighting units were best vitched together; and preferably where each ghting unit consisted of four to five lamps should be possible to light up each fitting by vo or more stages. For the general lighting, ndant fittings of the corona pattern suspended om the roof gave best results, and at the same me offered an opportunity for artistic design. oncealed lighting at or above the capitals the pillars sometimes allowed a fuller ap-reciation of the architecture of the church, id the source of light was quite out of the line vision of the congregation. The extra dis-nce away of the lighting units, however, eant an increase in the number or size of mps required. A system of short lighting rackets attached by bands to the top of llars had very little to commend it, save its neapness, if that were commendation at all. he chancel lighting should be the subject of pecial treatment, and, instead of the usual andard lamps fixed to the floor, lighting units oncealed in the window recesses provided good lumination on the altar. Unless, however, the djacent lighting units in the choir provided certain amount of distributed light on the ancel walls and floor, a rather theatrical fect was apt to be produced, which was aturally undesirable. This could easily be voided. At the time of installing electric light a church, it was often convenient to arrange so for push-button switches to operate lamps signals, for instance, from the west door to ie organ, or from the choir vestry to the organ. similar arrangement could be used to give me signals from the organ to the choir to aid ie organist, who usually had to fulfil the ties of choirmaster. The lamps used were, course, out of sight of the congregation, and itable push buttons were now obtainable hich would stand hard wear and which were tirely noiseless in action.

Government House Building.

Asked in the House of Commons how any houses for the working-classes were now der construction by his department, Mr. wett said there were 70 houses under construc-on, and 85 houses had been completed during e present year. In addition to completing the uses under construction, the further number ntemplated at present to be built is 20, making total of 5,334 houses under the Addison using scheme.

THE SCAPA SOCIETY

On May 23 the Scapa Society held its annual meeting at the rooms of the Royal United Service Institution. Lord Lascelles (President) presided.

In his opening speech Lord Lascelles said in the last year or so the society had acquired an immense increase in public interest, which was due not only to its own good work but to the support of the Press, from the large London papers down to the smallest country weekly. They had received very sympathetic treatment from the motoring - advertising societies—the oil companies and the Dunlop Company—who had behaved in a manner for which they were most grateful. The financial losses of these firms had not been small, for some of them had entered into contracts the abandoning of which had cost them even thousands of pounds, but if competitors in the same line of business agreed to do the same thing their losses by sales could not be great. He thought that they might be right in the view that when all the companies disfigured the country-side by monstrous advertisements their own ends were automatically defeated. The society was in sympathy with any action that could be taken to abolish the thoughtless custom of littering the country-side with waste paper and rubbish.

Another success which they had had this year was the removal of advertisements from the Stadium at Wembley.

Lord Newton, in moving "That the Report and Statement of Accounts of the Society as submitted be received and adopted," congratulated the society upon a most successful year, notably upon the preservation of Whitgift Hospital, the elimination of the advertisements on the Stadium at Wembley, and on the Bill now before Parliament, on which all their efforts ought to be concentrated. Their subscription list did not amount to £100 a year, and no other organisation could point to so much work on such slender resources. By a strange paradox they were in need of what they were always denouncing in other people—publicity. They stood in need of advertisement; he knew of a number of eminent people who had not even heard of the Society. The Bill which was now before the House of Commons was in a better position than on any other occasion. Captain G. E. W. Bowyer was now in charge, and it was due to his skill they had obtained a second reading for it. In the House of Lords it encountered the opposition of Lord Birkenhead, in order, he supposed, to show the ingenuity a first-class brain could display when occasion arose, but this was a case for versatility rather than ingenuity.

The success of the Scapa Society had been due largely to two men, one of whom, Mr. Richardson Evans, was not present. Their gratitude was also due to their secretary, Mr. Chubb, one of the most indefatigable workers he had ever met.

Sir Albert Gray (Chairman of the Society), in seconding the resolution, said, like other societies, at times they had their moments of depression; there seemed so little done, so much to do. Their present report, however, was extremely satisfactory. Lord Newton had referred to the services of Mr. Evans. He (Sir Albert) had been associated with him during the whole period of the life of the society, and the previous experience of Mr. Evans as a journalist had been of immense value to them.

The Earl of Crawford moved, "That this meeting, in view of the importance of protecting rural scenery from disfigurement by the display of advertisements, pledges itself to support the efforts of the Scapa Society, and further urges the Government to provide facilities for the remaining stages of the society's Advertisements Regulation Bill." He said that after an existence of thirty years the status and influence of the society were making a real impression on public opinion. The results of thirty years' propaganda had taken long to fructify, but they were now showing themselves in a most tangible and practical form. Personally, he liked advertisements, and if they pleased the eye and kept within proper limits he was inclined to patronise the firms, but when they dispossessed him of his common rights and forced themselves on the eye and into the face of every inoffensive citizen passing through beautiful country, he was repelled, and the advertisements did more harm than profit to the firms. That was not the opinion of a faddist, but was common knowledge and a growing habit.

With reference to local centres, he was glad to see it stated in the report that much could be done from London, and as far as possible was done, but effective action depended upon the willingness of residents to combine and co-operate in every effort to defend and to extend the amenities of their districts.

Mr. John Bailey (Treasurer), in seconding, said Mr. Evans, although not able to attend the meeting, had shown that his interest had not abated by a gift of £250. He considered the society had had four great successes. First securing Lord Lascelles as President; second the circular which Col. Ashley, when at the Ministry, had sent to the main road authorities with regard to their control of advertising; third, the wonderful negotiations with the oil companies; fourth, their Advertisement Regulation Bill. In conclusion, Mr. Bailey said although they had fixed the subscription at the low rate of 5s., he felt sure there were a number of subscribers who would gladly give five guineas in order to enable him to present a better balance sheet.

Captain Bowyer then moved that Lord Lascelles be re-elected President, which was seconded by Mr. Halsey Ricardo.

Mr. Frank Salisbury moved a vote of thanks to the Chairman.

YORKSHIRE ARCHITECTURAL SOCIETY

The Yorkshire Architectural and York Archæological Society recently held their annual meeting. Mr. P. J. Spalding presided.

The Honorary Secretary presented the annual report. The suggested desecration of the York Cholera Burial Ground in Station-road, with a view to facilitating the vehicular traffic at that spot, and safeguarding pedestrians, had, he said, occasioned the society much alarm, and although a deputation was sent to the City Council to protest against this scheme on æsthetic grounds, the project, by a large majority of votes, was sanctioned. This, on the face of it, might appear perturbing, but before finality was reached the promoters of the scheme had a very thorny path to negotiate, which this society felt confident in the end would prove impassable. The report expressed appreciation that Bedern Chapel was to be saved. The city's fortifications, among the York treasures, having been scheduled by His Majesty's Office of Works, the encroachment suggested on the moat in the neighbourhood of Layerthorpe Bridge, which was to be widened, had every probability of not being carried through, and it was hoped that the authorities would keep a vigilant eye on any suggested encroachment in the neighbourhood of the Cholera Burial Ground. It was agreed to make the following addition to the rule explaining what the society existed for:—

"And to prevent the disfigurement of the city by the erection of unsightly buildings and advertisements."

Dr. Evelyn, who suggested the addition, said their energies were practically concentrated on preserving the antiquities of the city of York

Satellite Towns.

At a recent meeting of the London County Council, Mr. Herbert Morrison moved for a report as to the submission of a supplemental estimate of £1,000 in respect of surveys in the Home Counties, with a view to the establishment by the Council of garden cities—"alternatively known as satellite towns or new industrial centres."

LEGAL SECTION

NOTES ON CURRENT CASES

Damages against Lessor for Breach of Covenant to Repair.

THE recent case, Hewitt *v.* Rowlands (*Weekly Notes*, April 5), decided a point which has not directly been decided before, probably because no one has ever raised it, that point being stated in the head-note to the report as follows, "Whether in an action by a tenant against his landlord for repairs, the execution of the repairs by the tenant is a condition precedent to the recovery of damages?"

The plaintiff in the action was the tenant of a dwelling house, and in 1875 had originally become tenant under an agreement for a term of five years, which provided that the landlord should "keep the cottage dry and the outside in repair." At the expiration of the term of five years, the plaintiff had remained in occupation as a yearly tenant.

The defendant was the owner in fee simple, having purchased the property in 1920. On March 31, 1921, the defendant had given the plaintiff notice to quit on the following October 1, but the tenant had remained on as a statutory tenant under the Rent Acts, and was still in occupation at the date the action was commenced.

The dwelling-house was formerly a farm-house to which additions had been made, the oldest portion being probably 150 years old, and the additions having been built about eighty and sixty years ago respectively. The outer walls of the original building were of red sandstone, the additions being of brick or brickwork covered with plaster, but there was no dampcourse to any part of the building. During 1921 the plaintiff had complained to the defendant of the house being damp, and a formal notice was given on November 25, 1921, to the defendant's solicitors that the house was very damp, and requesting immediate steps to be taken to render the house damp-proof. The defendant did not take any steps to do the repairs, and the plaintiff then issued a writ claiming damages for the breach of agreement. In the court below, judgment had been given for the defendant, but this had been reversed by the Court of Appeal, judgment being entered for the plaintiff, the damages to be assessed by the District Registrar of the High Court at Liverpool.

The dampness arose chiefly from the old sandstone walls having become saturated in course of time owing to the absence of a damp-course, but the defective condition of the roof and gutters had contributed to it. The cost of putting in a dampcourse and making good the roof and gutters and doing all work to put the house in proper repair was estimated by both sides at about £600, but one of the plaintiff's witnesses had admitted that the house was worn out, and that it would not be worth while to make such an expenditure on repairs if there was no obligation to do so. Evidence was given of certain special damage to certain pictures, a piano, and a carpet.

The District Registrar had assessed the damages at £30, stating that he had directed h mself that as regards the repairs a tenant in an action against his landlord for damages for breach of an agreement to repair, apart from any pecuniary loss or damage which the tenant had suffered from the landlord's default, could only recover the actual sum expended by him in executing repairs for which the landlord was responsible.

A Divisional Court decided that the Registrar was wrong in so directing himself, for although there was no exact authority upon the point, it had been held in Torrens *v.* Walker (1906, 2 Ch. 166; *The Builder*, May 19, 1906), that there was no difference in principle between the liability of a lessee on a covenant to repair, and the liability of a lessor under a like covenant, and in an action by a lessor against his tenant for non-repair, it was clear that the lessor need not repair the property before recovering damages.

The case was, therefore, remitted to the Registrar with, however, an int'mation that it did not follow that he ought to allow the total estimated cost of the repairs, for regard ought to be paid to the extent of the tenant's interest in the premises.

Torrens *v.* Walker was a very curious case; the house was some 200 years old, and the front and back walls had become dangerous. The tenant had served no notice on the landlord as to the want of repairs, but the London County Council had served a dangerous structure notice on the landlord requiring him to take down the front and back walls. The lessee communicated this notice to his landlord and vacated the premises, and brought an action for breach of covenant against the landlord, that covenant being to keep the outside of the house in good repair, but the Court held that as in law there is no breach of the covenant to repair before notice of want of repair is given, the tenant had no ground of action, for when notice was given the premises were irreparable. It may be noted in connection with this case that this house was on a triangular site and the destruction of those two walls practically destroyed it as a house, as this has a bearing on our observations below on Lurcott *v.* Wakeley.

On the subject of covenants to repair we may remind our readers that a very important pronouncement on the subject was made in the recent case Calthorpe *v.* McOscar (1923 2 K.B. 573), which we noted November 16 last. In that case three houses had been leased in 1825 for ninety-five years, the houses at that date being newly erected, under a covenant which, amongst other things, required the lessee to "well and sufficiently repair, support, uphold and maintain" them, and at the end of the term in 1919 the question was mainly whether under such a covenant all needful and necessary repairs had to be executed, or whether having regard to the age of the premises, the change in the neighbourhood, and the class of tenants who would be likely to take them, the repairs were limited to such as would render the houses fit for occupation by the class of tenant who would be likely to take them, and the difference between the two views was represented by a difference in the cost of the repairs between £586 and £220.

The Court accepted the latter view, and made some very valuable comments on the subject of repairing leases.

As regards the effects of time on a building, we noted a good many of the decisions in our issue December 8 in a note on Lurcott *v.* Wakeley (1911 1 K.B. 905), but the most important point in the decision in Calthorpe *v.* McOscar was, as we pointed out in our former note, November 16, that the Court considered all the various expressions used in repairing leases such as "well" or "proper" or "substantial or "good" or "sufficient" or "necessary" or "tenantable" and came to the conclusion that they added nothing to the meaning of the word "repair," and therefore that the principle laid down by the Court of Appeal in Proudfoot *v.* Hart (25 Q.B.D. 42) is applicable to all such cases, and the Court intimated that that principle was correctly set out in the headnote to that case: "Under an agreement to keep a house in good tenantable repair, and so leave the same at the end of the expiration of the term, the tenant's obligation is to put and keep the premises in such repair, as having regard to the age, character, and locality of the house would make it reasonably fit for the occupation of a tenant of the class who would be likely to take it." The Court, however, was careful to point out that the point as to detailed covenants, for instance to paint at particular periods, did not arise in that case.

The Court said: "Some standard must be taken. What is it to be? The notion of the actual owner may be generous or severe. The notion of the actual tenant may be narrow or indulgent. It is well to adopt a practical and working standard and thus to meet the difficulty arising when landlords and tenants have opposite views with respect to houses which vary greatly in age, description, locality and purpose. Such a standard is provided by Proudfoot *v.* Hart."

This question of repairs is of such importance we may usefully refer to one or two other observations of the Court in this case.

Mr. Justice McCardie pointed out that it seemed necessary to remember that although the words of the covenant did not vary with the lapse of years, yet the subject matter of the covenant—the house—changed greatly, and in the case he was considering when the lease expired in 1919 the houses in question had become old houses, although there was no question here as to their being old when they were demised as was the case in Lister *v.* Lane (1893 2 Q.B. 212) for instance. He then cited cases to show that the covenant in any event must be construed with moderation and not with severity—(Stanley *v.* Towgood, 1836 3 Bing (N.C.) 4), Harris *v.* Jones (1832 1 Moo. & Rob. 173), Scales *v.* Lawrence (1860 2 F. & F. 289), and Perry *v.* Chotzner, 1893 9 *Times* L.R. 488)—and he added that the landlord's right to damages is not affected either by the special purpose to which he may intend to put the premises upon the expiration of the term, or by any special arrangement he may have made with a new incoming tenant. For instance he does not lose his full right to damages although he intends to demolish the building—Rawlings *v.* Morgan (1865 18 C.B. (N.S.) 776)—nor by intending to pull down part of the premises to make structural alterations (Inderwick *v.* Leech (1885 1 *Times* L.R. 484), nor by the fact that he has let at a higher rent to a new tenant (Joyner *v.* Weeks (1891 2 Q.B. 31), but the standard of repair, as the Court pointed out, is not illustrated by the above cases, and it has now been decided to be as stated above.

We have thought it may be of use to examine in further detail this very important decision on this question of repair, a subject upon which there has been much conflict of opinion in the decided cases, and in conclusion we may say a word upon the subject of old houses, although there does not seem much to add to our note of December 8, 1911, on Lurcott *v.* Wakeley and other cases, as Lurcott *v.* Wakeley, which was a decision of the Court of Appeal, still represents the law.

In that case the defendants were assignees of a lease of premises some 200 or 300 years old. The lease had been granted for 28 years and in 1909, just before it expired, the London County Council had given the owner notice that the front external eastern wall to the level of the ground floor was in a dangerous condition and requiring him to take down the wall. The lease contained covenants requiring the lessees "well and substantially to repair . . . and keep in thorough repair and good condition all the demised premises and to yield them up at the termination of the term so repaired and kept together."

The owner of the premises complied with the order of the County Council and rebuilt the wall, but claimed the sum so expended from the assignees of the lease.

The assignees contended that this state of the wall was due to the effects of time and the elements and the age of the structure and they were not liable to make it good, but the Court of Appeal, affirming a Divisional Court, held

the lessees were liable and applied following test as expressed in the ent of the Master of the Rolls: Had ubject matter of the demise changed s the operation merely making good idiary portion of it as distinguished from hole? It was held that the repair in on was only restoration of a subsidiary n of the building. This distinguishes the rom Torrens *v.* Walker, which we have d to above. It must be noted that this ot affect the decision in Proudfoot *v.* Hart *upra*), which was approved by the Court of l in Lurcott's case, it only applies it.

would appear necessary to point out that gh the actual word "repair" may be have the same meaning, whether qualified t by adjectives, of course specific terms e introduced into a covenant which might he liability.

nce of Persons Employed on Relief Works.

ecision has been given in the case in *re* East Vest Flegg Rural District Council *re* Turner Pipes (*Weekly Notes*, May 3), which, as it the question of insurance generally under Unemployment Insurance Acts, as well as National Health Insurance Acts, does not r to us in the brief report yet available y satisfactory. The question raised in the was whether the appellants who were the authority and who employed persons who ly were exempt from Unemployment ance, being fishermen or agricultural rers, on relief work in raising material from l pits of which the authority were lessees, e on the roads, should make deductions the men's wages and pay contributions em under the Unemployment Insurance 1920. By leave of the Court the question lso raised as to Health Insurance.

e work was unremunerative to the Council, n making the payment they were assisted grant from the Unemployment Grants ittee. Payment was made to the men at ite of 22s. a week, but there was no agree- to employ the men on any particular terms r any period, although the contract was ly terminated by a week's notice.

vas contended that under the First Schedule II of the Unemployment Insurance Act employment was an "excepted employ- " being "Employment of a casual nature wise than for the purpose of the employer's or business." The Minister of Labour ecided that the men were employed persons the Act and the Council had appealed this decision.

Court held that the employment was l, one of the conditions being that the s of the men should remain on the register unemployment exchange and that they be required to leave at any time, but it ssed some doubt whether the work being nomic for the purpose of the Council's scheme it could be said to be "for the pur- of the employer's trade or business." As, ver, it was employment on road work by ppellants who were the road authority the is reported to have intimated that on the it was not prepared to disturb the decision Minister of Labour. This being a test e could have wished that a more authori- decision could have been given, especially re must be some doubt whether very ittent payments to the insurance funds and in respect of, persons engaged on works, in place of receiving poor law relief, benefit to anyone except in so far as they se the general insurance funds.

Rent Act: Furnished Flats.

omewhat new point appears to have been d in the recent case Prout *v.* Hunter and er (*Weekly Notes*, April 9). The plaintiff e owner of a block of flats at Brixton and d let three of the flats to a Mrs. Hunter, cupied one of them herself, but the other ts, which she held from the plaintiff on tenancies at rentals of 19s. 6d. and l., Mrs. Hunter had furnished and sublet, one to the other defendant in the action and the other to one Scott. The plaintiff had given Mrs. Hunter notice to quit and subsequently brought an action in the county court to recover possession of the two flats which Mrs. Hunter had let furnished.

One of the contentions raised by the plaintiff in the county court had been that this letting of the premises by Mrs. Hunter had rendered them business premises and outside the Act on that ground, but this had been negatived, but the county court Judge had held that under section 12 subsection (2) of the Act of 1920 the premises were within the Act. The plaintiff appealed and a Divisional Court entered judgment for the plaintiff, giving possession.

The point depends upon the first proviso to section 12 subsection (2).

Subsection (2) provides "This Act shall apply to a house or part of a house let as a separate dwelling" (within the limits prescribed as to rent or rateable value) "and every such house or part of a house shall be deemed to be a dwelling-house to which this Act applies, Provided that (i) this Act shall not, save as otherwise expressly provided, apply to a dwelling-house *bona fide* let at a rent which includes payment in respect of board, attendance or use of furniture."

The Court held that the Act dealt with the status of the premises themselves and not with the terms on which they were held, that is to say they had to look at the letting of the flats to the occupying tenants and not to the letting to the intermediate tenant, and as the flats were let to occupying tenants as furnished flats they were outside the protection of the Act. In so finding the Court intimated they were following the decision in Glossop and Another *v.* Ashley (1922 1 K.B. 1; *The Builder*, April 15, 1921), where to ascertain the standard rent the letting between the tenant and the subtenant in occupation was regarded. At present we can do nothing more but briefly note this decision as reported, but we may revert to it when an extended report in the Law Reports is available.

As the decision stands it appears that a subtenant who takes part of a dwelling-house furnished from the tenant is outside the protection of the Act, and the amendment introduced into section 12 subsection (2) proviso (i) by section 10 does not affect this point.

Rates and Increased Rent.

The case, Strickland *v.* Palmer, which we noted in our Legal Section, February 29, and which has drawn the attention of the Legislature to the necessity of amending the law if the decision of the Divisional Court correctly expressed it, has now been reversed by the Court of Appeal, and therefore the necessity for further legislation no longer exists. The main question raised in that case was: If an increase of rent has been made to meet an increase in rates, and subsequently the rates are lowered, is the tenant entitled to a corresponding reduction in the rent?

The Divisional Court had decided that question in the negative, but the Court of Appeal has now reversed this decision, holding that whenever a landlord claims to recover rent, which includes an increase in rent which represents an increase in rates, he must show that the increase over the standard rent does not include an increase in respect of rates in excess of the amount actually paid by him in respect of increase of rates.

This decision seems to give a more logical interpretation to section 2, sub-section (1) (*b*) of the Act of 1920, which speaks of "an amount not exceeding any increase in the amount for the time being payable by the landlord in respect of rates over the corresponding amount paid in respect of the yearly, half-yearly, or other period which included August 3, 1914; or, in the case of a dwelling-house for which no rates were payable in respect of any period which included the said date, the date on which the rates first became payable thereafter." And it has also been generally agreed that where rent has been increased in respect of increased rates, it is only equitable that when the rates fall the tenant should have the benefit of the reduction, but it will add to the difficulties of landlords in calculating increases of rent.

THE SURVEYORS' INSTITUTION

The Surveyors' Institution recently held their annual general meeting at Great George-street, Westminster.

In presenting their fifty-sixth annual report (from which we take the following extracts) the Council felt that they might congratulate members on another year of useful public work and on the continued progress of the Institution. The most important work of a public nature which had occupied the Institution during the year had been in connection with the Draft Rating and Valuation Bill, which was submitted to the Council in December last by the then Minister of Health, with a request for the considered views of the profession upon the various proposals contained therein. The Council had also given, during the year, much attention to the housing position and the control of houses. In connection with the latter they issued to members a further memorandum by Mr. Graham Mould bringing up to date the information and explaining the legal position with regard to the Rent Restrictions Act. Since then a Bill had been introduced in the House of Commons by a private Member, and had been referred to Grand Committee. Under this Bill the period of restriction would be extended, and the provisions of the 1923 Act with regard to decontrol would be, to a great extent, repealed. A meeting, also, was arranged between representatives of the Institution and officers representing the Minister of Health, at which the views of the Institution as to the effect of restrictions on the housing problem were explained. In advising on these questions the Council had attempted to indicate their effect upon the real problem which had to be solved, the shortage of houses, and, in doing so, had placed in the forefront the public need rather than the immediate advantage of any particular class.

The vacancies on the Board of Governors of the College of Estate Management caused by the deaths of Mr. George Corderoy and Mr. Howard Martin had been filled by the nomination of Mr. F. H. A. Hardcastle and Mr. E. H. Leeder on behalf of the Institution. The place of Mr. R. Parry had been filled by the appointment of Mr. B. W. Adkin, who had acted as Vice-Principal under Mr. Parry.

Representations made to the Ministry of Health on the subject of notices to owners of property in connection with town planning schemes, and on the hardship imposed upon owners of property by the penal provisions of Section 9 of the Housing, Town Planning, etc., Act, 1919, were still under consideration by that Department.

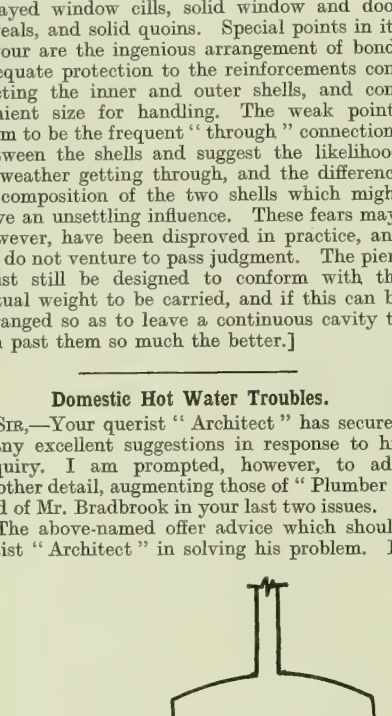
Sir Edwin Savill, President, and the Council of the Surveyors' Institution held a reception recently at the Zoological Gardens. Among those present were:—

Sir John Oakley and Messrs. J. I. Davidson, J. M. Clark, Arthur Vernon, and John Willmot, Past Presidents of the Institution; Messrs. J. D. Wallis, H. M. Cobb, and E. A. Rawlence, Vice-Presidents; and Messrs. C. H. Bedells, C. Chant, S. Hicks, J. E. Bidwell, F. H. A. Hardcastle, W. T. Hall, H. Hartley, C. J. Howell Thomas, W. H. Eve, C. H. Gott, A. G. Cross, G. T. Brown, and Frank Hunt, members of the Council. The Presidents of the Institute of Builders, the Institution of Structural Engineers, the Institute of Painters and Decorators, and the Institution of Chartered Accountants; and the Secretaries of the Auctioneers' Institute and the Land Agents' Society. Sir Richard Redmayne, Sir William Wells, Sir Charles Ruthen, Sir Edward Boyle, K.C., Sir Henry Tanner, Sir Percy Thompson, Sir Thomas Morton, Brigadier-General Mowatt.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript?—ED.

[REPLY TO MR. HOLLOWAY.]



Concrete Building Blocks.

[We have received particulars of a patent improved concrete building block for casting on the site from materials to hand, which we have forwarded to our correspondent. In some respects it would appear to meet many of the difficulties of the case in point, while the patentee claims to have saved 40 per cent. on ordinary brick construction in actual work. The blocks have a continuous cavity within themselves and are 9 in. thick including same, which would apply readily to the setting out of the 14 in. walls, the outer shell being as suggested in 4½ in. brick applied direct to the outer face of the blocks and adequately tied in with galvanised iron ties. The system includes the production of solid door cills and steps, solid splayed window cills, solid window and door reveals, and solid quoins. Special points in its favour are the ingenious arrangement of bond, adequate protection to the reinforcements connecting the inner and outer shells, and convenient size for handling. The weak points seem to be the frequent "through" connections between the shells and suggest the likelihood of weather getting through, and the difference in composition of the two shells which might have an unsettling influence. These fears may, however, have been disproved in practice, and we do not venture to pass judgment. The piers must still be designed to conform with the actual weight to be carried, and if this can be arranged so as to leave a continuous cavity to run past them so much the better.]

Domestic Hot Water Troubles.

SIR,—Your querist "Architect" has secured many excellent suggestions in response to his inquiry. I am prompted, however, to add another detail, augmenting those of "Plumber" and of Mr. Bradbrook in your last two issues.

The above-named offer advice which should assist "Architect" in solving his problem. It

is not necessary, however, to reduce permanently the storage capacity of the cylinder in order to ensure a more speedy hot water supply.

The enclosed sketch shows arrangement whereby with little modification of schemes suggested the quicker supply may be obtained, and also, when speed is not the primary consideration, the cylinder may be used to its full capacity. The alteration merely consists of connection, as has been advised, of a return higher up the cylinder, the existing return being retained, and a two-way valve introduced at the point indicated. EDWARD C. TASKER.

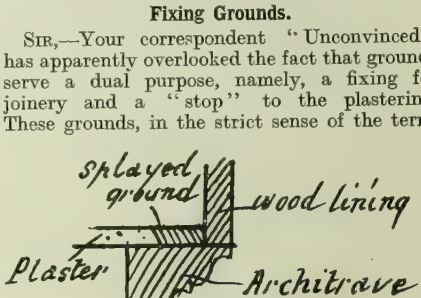
Iron Tank Leakage.

SIR,—A galvanised iron tank, some twelve years old, measuring about 3 ft. by 2 ft. by 2 ft. (depth) for storage of water for general service (but not for drinking), in a private house, has developed a pinhole leak due to action of rust on inside. At present it is, in itself, very trifling, but raises apprehension as to the future—possibly very near future. Renewal or removal of the tank would be extremely inconvenient.

Can any of your readers advise effectual measures for dealing with the trouble and preventing further development?

"ARCHITECT."

[REPLY TO "QUERY."]



Party Wall.

SIR,—The usual by-law requirement for corbelling out is that the work so corbelled out should not project more than the thickness of the wall measured immediately below the corbel, this being in the case of chimney breasts. This is quite a maximum unless equilibrium is maintained by the shoring action of cross-beams, girders or joists, or unless the outer portion of the upper wall is heavily loaded with a parapet or otherwise. The centre of gravity of the cross section of the wall is easily found, and should occur vertically over the middle half of the wall below, or at worst not outside the wall below unless further assisted against the over-turning tendency. Generally the overhanging portion is honeycombed with flues, lightening it considerably and drawing back the centre of gravity of the mass. F. D.

[REPLY TO "UNCONVINCED."]

Fixing Grounds.

SIR,—Your correspondent "Unconvinced" has apparently overlooked the fact that grounds serve a dual purpose, namely, a fixing for joinery and a "stop" to the plastering. These grounds, in the strict sense of the term,

Sectional Plan

are not needed as a fixing to unplastered walls—the technical terms given to fixings in this case being "battens." Attached is a rough sketch of a ground at the back of an architrave in a plastered wall.

Croydon. A. E. FLOWER.

SIR,—In work of which a high finish is not expected it is certainly unnecessary to fix wood grounds for skirtings, frieze rails and dado rails, &c., but where a high standard is demanded and where it is intended to condemn any little hollows that may appear in the plaster surface where these rails, &c., occur, it is only fair to provide the grounds as a guide to the plasterer at the points where irregularities will be most apparent.

This is really the main purpose served by grounds and it is correct to assume that they provide no better fixing to the joinery than the original plugs. Frequent nailing between plugs does not arrest warping and twisting tendencies, as the joinery members are generally stronger than the grounds themselves and will carry them out with them if they have the will to warp.

For the cheaper class of building grounds can certainly be omitted, and we probably do well to swallow the slight shortcomings that result, in these days of high prices. B. M.

[REPLY TO "NOVICE."]

Lightning Conductor.

SIR,—The best earth connection for a lightni conductor is a copper plate with a substant soldered connection to the lightning rod. T plate should be in permanently moist soil if t can be reached at a reasonable depth, but if t cannot be ensured the plate should be w packed round with moist charcoal and co which will retain the moisture.

Incidentally, if the authorities are not lookir by far the safest connection is to a public wat main. "CONDUCTOR."

Cracks in Plaster.

SIR,—In the house in which I am living, a which I entered soon after completion, the has developed a crack of rather unsightly dime sions at the junction of ceiling and wall along o side of a room. There is no sign of any sett ment in the brickwork outside, and it has be suggested to me that the joists above have be unevenly bedded, that the fixing of the flo boards above in the first place drew up certain the joists to a level top surface (the plasteri being done at this stage), and that subseque traffic and heavy furniture has been drivi these joists back on to their beds, so disturbi the plastering below. The modern practice omitting bond timbers seems to lend this soluti some colour.

If this is really the case, will it be safe no after two years, to cut out the cracks and ma good, or is the trouble likely to recur?

"HOUSEHOLDER."

ROYAL INSTITUTE O BRITISH ARCHITECTS

Annual Conference.

The Annual Conference of the R.I.B.A. w take place at Oxford from July 9–12, at t invitation of the Berks, Bucks and Ox Architectural Association.

Visit to Fletton Brickyards.

At the invitation of the directors of the Lond Brick Co. and Forders, Ltd., the Science Sta ing Committee of the R.I.B.A. has arrange visit to the Fletton Brickyards, Peterborough, take place on May 31.

Minutes.

The following notes are from the minutes the last Council meeting:—

WATERLOO BRIDGE.—On the recommendati of the Art Standing Committee it was decided communicate with the London County Coun expressing the hope firstly, that there would no alteration to the elevation of the Bridge, a especially that there would be no footpa constructed so as to project from the parap and secondly, that in the event of some sche for widening being inevitable, such widen will be the minimum possible consonant w traffic requirements.

REPORTS OF LAW CASES.—On the recomm dation of the Practice Standing Committee was decided to arrange with the Instit Solicitors for the supply from time to time typewritten copies of important cases deal with Building Acts, Ancient Lights and Prof sional Practice, which are reported at length the official Law Reports, and which are availa only to solicitors and barristers, and that th copies of reports be filed and indexed in Library for reference.

PROFESSIONAL CONDUCT.—Under the p visions of By-law 24 a member was censured contravening Clause 4 of the "Suggesti Governing the Professional Conduct and Prac of Architects" by supplanting another mem who had already been entrusted with a co mission.

INSURANCE OF ARCHITECTS' AND QUANT SURVEYORS' FEES.—On the recommendation the Practice Standing Committee it was deci to publish a note in the "Journal," as to desirability of adequately insuring archite and quantity surveyors' fees, including that making the claim.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

A DEBATE took place in the House of Lords ... on the subject of St. Paul's Bridge. ... Denham moved that before further steps ... the Fine Arts Committee shall be ...

... Balfour, on behalf of the Government, ... was glad that the City Corporation was ... going into the whole matter, and he ... agreed that no irrevocable steps should ... until the Fine Arts Committee had ... consulted. Nothing ought to be done ... as far as human foresight could make it ..., it was made certain that no damage ... done to the stability of St. Paul's ... If such damage occurred it would ... national misfortune of the first import-

... Balfour said that the æsthetic issues ... the proposal of the new bridge were ... selves of national importance, because, ... place, they dealt with one of the ... derful river and urban prospects in ..., and secondly, because they touched ... existence of one of the greatest build- ... which London boasted, undoubtedly ... east modern post-mediæval cathedral ... world, and a perpetual source of pride ... to London but to the whole Empire. ... was a national possession.

... Curzon said that Lord Crawford had ... that if the motion were adopted the ... Committee would be prepared to ... ce. He hoped the purely æsthetic ... the matter had not been swept aside ... the much larger practical, technical, ... and scientific considerations involved. ... describing London as "a wonderful ... contrasts, he commented on the ... succession of bridges which at present ... the Thames, and asked if they were ... to add to these æsthetic horrors, or ... the Metropolis something that would ... source of beauty and delight? It was ... importance from the æsthetic point ... that no new bridge should be built ... Thames unless it added to the ... the landscape. He was speaking of ... of the landscape in relation to the ... St. Paul's; any new bridge must ... with the beauty of the dome. ... motion was agreed to.

The Apprenticeship Scheme.

Mr. Sunlight asked the Minister of Health ... understanding, if any, he had arrived at ... employers in the building industry ... ensure the carrying out of the scheme ... tation of labour by apprentices in ... but the housing programme, the con- ... would equally be fulfilled on building ... than houses.

Mr. Greenwood said that the Minister under- ... the proposal of the Committee of ... Employers and Operatives was that ... apprenticeship scheme should apply both ... and other building work.

Regional Town Planning.

Mr. Sunlight asked the Minister if, along- ... his proposals for building 2,500,000 ... during the next fifteen years, adequate ... been taken in his department to lay ... regional plans to cover the whole country ... left to the individual interest of local ..., with a view to avoiding congested ... areas in the future as towns expanded.

Mr. Greenwood said that the Minister ... was encouraging the formation of ... own-planning committees, and good ... had been made, but he did not think ... necessary at the moment to attempt ... the whole country.

Ancient Monuments.

Mr. Middleton asked the First Commissioner ... whether he was aware of the diffi- culty members found in readily obtaining authoritative information about ancient monuments in the care of his department; and whether he would arrange for periodical reports regarding these monuments to be made to Parliament.

Mr. Jowett said he hoped that it might be possible this year to resume the issue of annual reports, the suspension of which was necessary during the war and had since been continued on grounds of economy. His department was also arranging for cheap leaflets to be prepared, giving a short history of each monument of importance throughout the country.

Fine Arts Commission.

Asked by Lord H. Cavendish-Bentinck whether it was proposed to add fresh members to the Commission of Fine Arts, Mr. Snowden, Chancellor of the Exchequer, said no final decision had yet been taken. If any fresh members were appointed before the time when the present members automatically retired, the appointments would be made on the recommendation of the Prime Minister.

The Thames Bridges.

Mr. Gosling, the Minister of Transport, replying to a number of questions, said that he understood that the London County Council was studying the problem of the Thames bridges, and would probably call into consultation other metropolitan authorities. The responsibility for the maintenance of Westminster Bridge rested with the London County Council, who kept careful observation on the structure. The Council had their own competent expert advisers, with whom officers in his department were in close touch.

Working-Class Houses.

Mr. Wheatley informed Mr. E. Simon that according to returns obtained from local authorities in England and Wales as to building by private enterprise without assistance from public funds, it was estimated that over 28,000 houses of not more than £26 rateable value in the provinces and £35 in the Metropolitan Police districts were completed during the six months ending March last. During the same period 4,158 houses were also completed by private enterprise with State assistance under the Housing, etc., Act, 1923.

Results of Private Enterprise.

Mr. Wheatley informed Mr. E. Simon that the following numbers of houses were in course of erection by private enterprise on March 31 last:—

Subsidy houses	20,222
Non-subsidy houses of all sizes (approximate) ...	36,750
Total	56,972

Increased Building Costs.

Mr. Lambert asked the Minister of Health the reason for the increase in the cost of building parlour-houses from £386 in January last to £425 in April; and when he anticipated the cost of building houses would be reduced correspondingly with the cost of living to about 75 per cent. above pre-war prices.

Mr. Wheatley said that the increase due to the actual increase in market price of materials and in rates of wages since January last was equivalent on the average to about £5 10s. per non-parlour house. He hoped that with the adoption of the Government's proposals, difficulties of shortage of labour and materials would be removed and that the excess cost might be sensibly reduced.

The 1923 Act.

Sir William Joynson-Hicks asked the total number of houses for which subsidies had been applied for under the 1923 Act, and the total number sanctioned.

Mr. Wheatley said that approval had been given to schemes providing for the erection of 135,660 houses, including 46,133 proposed to be built by local authorities and 89,507 by private enterprise. Contracts had been let by local authorities carrying 28,754 houses, while in respect of the houses to be built by private enterprise definite arrangements had been made for 56,626 houses.

The Brick Supply.

Mr. Wheatley said the question of brick supply was under consideration in connection with the Government's housing proposals, and he was not at present in a position to make a statement.

Answering a question as to whether the Government had any intention of controlling the brickfields, Mr. Wheatley said that the difficulty—and many other difficulties associated with the problem of housing—was due to the breakdown of private enterprise.

The New Housing Bill.

Mr. Wheatley informed Sir K. Wood that, while giving no pledge on the matter, he hoped to be able to introduce the new Housing Bill before the Whitsuntide recess.

Recent Prices.

Mr. Wheatley informed Sir K. Wood that returns from local authorities showed that for England and Wales the average prices for houses built during the last two months for which information was available were as follows:—

	Non-parlour.		Parlour.
March ...	£416	...	£459
April ...	425	...	440
	Increase £9		Decrease £19

The £700 Limit.

Viscount Wolmer asked the Minister of Health under which section of the Housing Act of 1923 he had imposed a limit of £700 on the cost of houses eligible for subsidy under that Act.

Mr. Wheatley said that before approving the proposals of a local authority for subsidising the erection of working-class houses he was required by Section 2 of the Housing Act, 1923, to be satisfied that the need for the houses could not be met without assistance under the Act. The question whether the subsidy should be available for houses of so high a cost as that indicated by the noble lord would depend on local circumstances. No general rule could be laid down, but he was of opinion that the price mentioned was too high for a working-class house.

Unemployment in the Building Trades.

Replying to a question, Mr. T. Shaw stated the average percentage of unemployment in the building industry for the years 1920 to 1924 was as follows:—

	1920	1921	1922 Jan. & Mar.	1922 Feb. to Dec.*	1923	1924 Jan. to April
Carpenters ..	0·7	7·0	10·2	9·1	7·3	3·7
Bricklayers	0·4	4·3	13·1	9·8	6·5	1·7
Masons	1·9	8·0	16·4	9·1	6·1	3·1
Plasterers ..	1·8	2·4	4·1	7·4	10·0	2·9
Painters	5·3	17·6	25·3	14·3	19·2	17·6
Plumbers....	2·6	8·3	10·2	10·3	10·0	7·0
Total of Six Unskilled Occuptns	2·3	9·8	15·2	10·8	11·0	7·7

* Includes Northern Ireland.

Sale of Works of Art.

Mr. Sunlight asked the First Commissioner of Works if he received periodical reports from the Commission of Fine Arts on whether or not works of art occasionally offered for sale by auction were of such national importance that steps should be taken to acquire them for the nation, having in view that an important public sale was about to be held.

Mr. Jowett said that the answer to the first part of the question was in the negative. Such matters were, he understood, outside the scope of the Royal Commission of Fine Arts. The latter part of the question was one for the Chancellor of the Exchequer.

THE BUILDING TRADE

TRAFFIC SHOCKS AND CONSTRUCTION

By J. HEMBROW.

During the first fifteen or twenty years of this century, and more particularly in this last ten years, there has been an augmented evidence of the effect on buildings of the rapidly increasing vibration from traffic, and probably before long, when it is considered that such shocks are almost inevitable, and that in large old towns they will continue for many years, we shall find it necessary to include some special provision in the construction of our buildings to counteract the effect.

The most simple step towards reducing this vibration would be the abandonment by local authorities of antiquated and unsatisfactory street surfaces, particularly stone setts, which, from their individual irregularity and their inevitably early gift of a road like a choppy sea, cause more shocks and noise than any other surface. Any reader can estimate for himself their effect by noticing some of the points in such a road, where a heavy motor lorry travelling at a good speed (and speed will increase in the future) drops suddenly from a height sometimes of inches and gives a direct blow of many tons to the surface of the road. Even with a reasonable lorry load of, say, four tons, and the weight of the chassis, perhaps three tons, the blow it will give in dropping when it is travelling horizontally at, say, twelve miles per hour is tremendous.

To do away with this kind of road surface would lessen the problem, but it would not do away with vibration altogether, as all roads wear, and tramlines will probably exist for years yet. Further, when one sees the number of important towns—up-to-date in other respects—which cling to this habit—it is nothing more—of their fathers, one feels that one must turn to other solutions.

Certainly it will be necessary to calculate for vibration in the future in some way perhaps similar to our provision against the vibration of machinery, but the problem will divide itself into four sections, *i.e.*, the treatment of old and new buildings and the question whether it will be better to deal with the structure itself or to insulate it from shocks in each case.

Recently the writer was asked by a brother architect to advise him in the case of an old (about 1860 or 70) commercial building which was suffering in this way. The building had been (the phrase sounds rather humorous) behaving itself quite well until recently, since when plaster had refused to stay sound on certain internal walls, with increasing persistency sheets of glass had cracked without any apparent human agency, and other phenomena disturbing and mysterious to the occupants had occurred. It appeared, on examining the structure, that although the whole building was shaken when a heavy lorry came by, the effect was greatest in one particular part. This was found to be over a very long steel or iron beam. The beam had on account of plan difficulties been made of considerably less than text-book depth for its length, but had been correctly calculated in view of this circumstance and the greater defection allowed for. The architect in his day had not provided for speedy blows of ten or more tons impact any more than he had provided for machinery, with an obvious result that the beam was acting like the trusty yew of the long bow. A central support was impossible in the form of stanchion or column, but a scheme was devised to stiffen the beam.

This implies that in a new building a factor ought to be agreed by which the normal calculations for steelwork and wood beams at present used can be improved. It would probably be fairly simple to arrive at such if a means could be found of recording the effect of traffic shocks through some suitable instrument. I think some such factor will be a real necessity in towns like Bradford and Manchester where some day tubes or other underground traffic will add to the shocks received by heavily loaded buildings never calculated to suffer them.

Prevention is better than cure, however, and as far as street shocks are concerned it should be possible to insulate a building. I believe records show that, except in certain isolated circumstances, the surface blows of traffic only affect the subsoil for a comparatively short distance downwards, the shocks being absorbed by lateral distribution of the force. If, therefore, this distance could be calculated a trench or area cut round the affected fronts of a building, with its foundations below the effect of traffic, might be effective to absorb the vibration. The wall, of course, would have to be at a sufficient distance from the building for it to move independently of it, and if the area could not be left open, as in a street paved up to the building, it could be filled with sand or some material to be determined upon which would move vertically and absorb horizontally the surface movements. In any conversations on this subject this has been the most tical suggestion we could find. I believe W. R. Davidge was the first to moot the in this country. There are certain di ties in the way of this method in n streets where the local authority enough wants its mains, etc., under the path. It should be possible, however, ever the authority allows sufficient spac pavement lights.

Where no area can be obtained the lem is more difficult, and this is unfort as in narrow streets the trouble is worse. A suggestion has been made t vertical joint between the face of the and the ground, obtained by placing sheets of suitable material together, effect a cure. But "graphs" seem to that the lateral movement resulting fr traffic blow would momentarily bind sheets and the vibration be conveyed. would wish that it was possible to hope in future some adequate insulation mig provided by the authorities in making remaking the street.

Many of the readers of *The Builder* have met with this problem. The branch the building and kindred trades it affect very numerous. It would be interesting instance, to know how many serious have been caused by the constant vibr of traffic causing tube conduits for el light of a low grade specification, to c short and fire. Its effect on closely jo masonry is varied and unhappy—tiling terra-cotta are often affected. In poi fact, it is hard to say where its malig activities end.

There may be numerous better solu than those I have suggested. It woul most useful if anyone able to add to knowledge would give seekers after enlig ment the benefit of their experience and gestions.

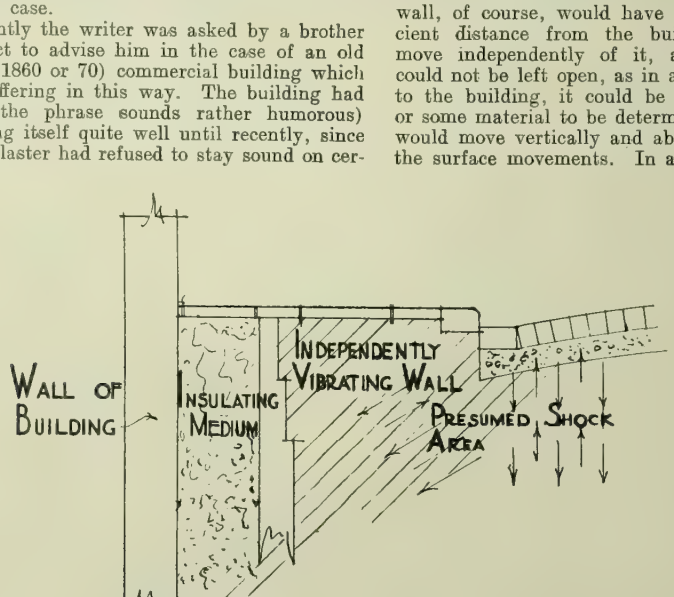


DIAGRAM OF SUGGESTED INSULATION

BUILDING COURSE A GLOUCESTER

We have received from the Board of Ed tion, Westminster, the following commu tion :—

If the number of suitable applicants is cient the Board of Education will provi Gloucester, from the evening of July 10 t morning of July 13, a short course of instru for full-time and part-time teachers of bui and allied subjects employed in technical evening schools in Gloucester and the surro ing towns and areas. The object of the cou to afford teachers opportunities of stud practically the growth, conversion, and qua of English forest-grown timber; the occurr quarrying, and qualities of sandstone and o building stones; and by means of lectures demonstrations modern methods of teac building and allied subjects. The cour limited to 20 members, and the cost is expe to be about £1 11s. Certain allowances w granted by the Board.

As the numbers are limited it is essential teachers should not apply unless they are pared to attend if selected. Teachers who to apply for permission to attend the co must fill up and return a Form (106i. U. later than June 14, and selected applicants be informed before June 23 that accommod has been reserved for them. Teachers in sc working under the direction of the local ed tion authority must return their applica through that authority. Various lectures be given, including one by Mr. Martin S. Bi H.M.I., F.R.I.B.A., on "The Architectu Gloucester and the Cotswold Area."

LEASEHOLD ENFRANCHISEMENT

We commend to the notice of our readers Memorandum issued by the Council of the eyors' Institution (an abstract of which ave last week) on the subject of Leasehold ranchisement, which is dealt with in a cial spirit, although the conclusion the ncil has come to is adverse to the enfran- ement of leaseholds. The enfranchisement easeholds perhaps in the abstract appeals ie public mind, and measures dealing with question may be passed without due con- ation being given to the weighty reasons nst such a policy, and as the arguments nst such a course being adopted are con- d in this Memorandum, and very lucidly essed, we hope those interested in the tion will take the opportunity of consider- them. The Memorandum states that two were introduced in the recent session for compulsory enfranchisement of leaseholds, that a movement in favour of such a y is gaining support; but it points out certain recognised hardships and disabili- have already to a large extent been met ecent legislation, and it further indicates such remedies may be extended without ting to compulsory enfranchisement, and reasons and arguments against wholesale nchisement.

he Memorandum is practically divided into sections, the first section showing the ptions from the public point of view as against the interests of the community, second section dealing with private inter- t and the third section containing proposals dealing with disabilities attaching to the hold system which have not already been with by legislation. In these days the ments contained in the first section relat- o the interests of the community are likely arry more weight than those addressed to the interests of the freeholder and the holder, and it is important that those ments should be brought to the notice of nterested in the improvement of housing itions, and the clearing of slum areas, and re in entire accord with the views ex- ed that, far from encouraging bad build- nd the growth of slum areas, the lease- system is advantageous, and the abolition rge estates and the multiplication of indi- l owners only increases the difficulties pienced, and, moreover, lays the local rities open to more extortionate demands. the second section of the Memorandum question is again referred to, when it is ed out that the right to enfranchise would e lessees to obstruct the re-development of ing estates by demanding the acquisition of rights by the owners, very likely at ex- rtnate rates, and it is stated that the Rent t have provided many examples of these bilities, but that that legislation is merely porary. It is certainly correct to say that limit has been promised to the duration the Rent Restriction Acts, but will the effect hat legislation be merely temporary? It s dealt a blow at the leasehold system which ayhave permanent results, and those who adthis Memorandum will see that the argu- m used against enfranchisement to a great t apply equally to the conditions prevail- consequence of Rent Restriction, and e suspension of the leasehold system will ve serious results in the future, and its ec can already be discerned throughout the ntry, coupled with the breaking up of the g estates. The third section of the Memo- dum containing proposals for dealing with abilities attaching to the leasehold system ints some very practical suggestions, as. instance, that fines or payments demanded consent on the part of a landlord to altera- n and additions to premises should be made ecverable, as is the case under Section 3 the Conveyancing and Law of Property Act, 92 in the case of licences to under-let or ing, and that where properties are about be pulled down the measure of damages should be the actual damage to the reversion and not the cost of compliance with the lease at the end of the term as well as during its currency; but in connection with the proposals made it is suggested that a special tribunal should be set up, something on the model of that under the London Building Act with regard to party walls, which would have power to consider such questions as consent to alterations and additions, compensation for improvements, dilapidations, terms of renewal, and other matters. At the moment we prefer not to express any definite opinion on this proposal, but reserve our opinion. The whole report should be read and be given the most careful consideration.

BUILDING CONDITIONS IN CANADA

The general secretary of the United Operative Plumbers and Domestic Engineers' Association recently received the following letter from the United Association of Journeymen Plumbers and Steam Fitters of the United States and Canada, Local Union No. 46, regarding the condition of the building trade in Canada:—

"In view of the fact that many of your members are coming to Canada at the present time, I feel it is my duty to write you to inform you of the existing conditions of the trade here in Toronto, which is the largest local union in Canada, and to which city most of your members migrate. A large number of our members have been idle since December 1 last, and a number have only worked on broken time, in many cases a few hours each week. The prospects are that there will be many more months of idleness, as there is nothing doing in the building trades line. Many of our members, who were born here and were never out of the city, have been compelled to seek work in the United States, so you will no doubt realise the conditions existing at the present time. Therefore my object in writing you is to ask you to inform your members of the true state of the trade existing here at present, and to inform them that there is no possibility of obtaining work for many months, if at all. In conversation with some of your members who have recently arrived here, they have told me that in some of the districts the building work is fairly good in England. If that is so, it would be unwise for them to come to a strange country, where there are thousands out of work, notwithstanding reports to the contrary. I trust you will receive this letter in the spirit in which it is written, for I am of the opinion that, should the emigration continue to Canada, there is going to be many cases of suffering and hardship during the winter months to come."

Speaking recently at a meeting of the Council of the I.L.P., Mr. Tom Richardson, ex-M.P. for Workington, who has just returned from a visit to Canada, made the following statement with regard to the question of immigration into that country:—

"In view of the unemployment in the cities and the poor conditions on the land, it is not only criminal, but an act of cruelty to encourage people to seek work in Canada," he asserted. "There are thousands of unemployed in the cities, and 75 per cent. of the immigrants who go to work on the land go down."

Town Planning.

At a meeting of the London County Council, on May 27, Mrs. Lowe moved that it be referred to the Housing Committee and the Town-Planning (Special) Committee to consider and report whether or not the Council should exercise its powers under section 10 of the Housing (Additional Powers) Act, 1919, with a view to the establishment by the Council of garden cities (alternatively known as satellite towns or new industrial centres) on the general lines of Letchworth and Welwyn garden cities.

FACTORY LIGHTING

At a recent meeting of the Illuminating Engineering Society, Mr. P. J. Waldram lectured on "Some Problems in the Daylight Lighting of Textile Factories." In order to appreciate properly the extent to which lighting was affected by the exigencies of manufacture, it was, he said, necessary to review the processes involved between the receipt of the cotton in bale to the finished goods.

In all the operations of spinning the yarn was severely handled, and everything must be subordinated to keeping it supple and tenacious. The high temperatures and humidity required would be impossible in top-lit sheds. Side-lit rooms were the only possible structures, and even in them, although adequate natural illumination was almost essential, high and equable temperature, especially in fine spinning, was absolutely so. Large windows were, therefore, ruled out by the risk of frequent yarn breakages. Narrow rooms would help, but the necessary length of modern mules involved widths of 140 ft. or thereabouts.

The operations of weaving were far less trying to the completely spun yarn, and the necessary requirements of humidity and temperature permitted of them being carried out in single-story buildings. The only precaution necessary was to use north-light roofs with the steeper or glazed side facing the north or north-east to avoid sun. The shorter and steeper slope only of the weaving shed roof was glazed. If it faced due north and was not flatter than about 60 degs. with the vertical, all sun between 6 a.m. to 6 p.m. (nominally 7 a.m. to 7 p.m. summer time) would be excluded. That was important because with such a large glass area it was even more difficult to keep down the temperature in summer sufficiently to prevent the operatives collapsing from heat exhaustion than it was to keep it up in winter sufficiently to prevent undue breakage of yarn. At one time an aspect for the glass side of shed roofs slightly east of north was favoured, because the afternoon sun after 6 p.m. was hotter than the early morning sun before 6 a.m., but the introduction of summer time and the shortening of hours of working had rendered that almost unnecessary.

The card room, scutching room, conditioning room and reception bays almost invariably occupied the whole of the ground floor and the area they required was, fortunately for the lighting, greater than that of a spinning floor above. That meant that the long rectangular box of the mill proper was enlarged by sheds or one-story buildings on at least three sides, the engine and boiler rooms generally occupying one end. The sheds were usually top-lit—the card room proper being kept high to secure a belt of windows above the level of the shed roofs. The card room windows should, like all windows in textile buildings, go right up to the ceiling. Even a slight bulk-heading of the window in the thickness of the floor, to bring the top edge of the glass flush with or even slightly above the ceiling, was desirable in order to secure the maximum amount of reflected light from the ceiling, which should be whitewashed as frequently as possible. All conditioning, carding and combing operations required more vertical than horizontal light, in which they differed essentially from spinning operations. In modern card rooms a glass area of about 9 per cent. to 10 per cent. of the floor area was generally provided.

On account of the length of the modern mule, rooms 130 to 140 ft. wide were essential. There would probably be 10 to 12 bays of some 21 ft. to 22 ft. wide. The difficulties of keeping a high and equable temperature in rooms of these huge dimensions were obvious if the glass area was great; and attempts to use practically continuous windows had failed because of the severe cooling of the air round the ends of the mules. But the old 5 ft. to 5 ft. 6 in. brick pier between every pair of windows would be reduced. Even for fine spinning a ratio of 7.7 per cent. of glass to

floor was found in one of the newest and most successful mills, and in a very modern mill at Oldham he had found as much as 12 per cent. in a 140 ft. mule room. The lower squares of the windows were almost invariably glazed with hammered plate. That was said to give a soft diffused light surface against which to view the long lines of yarn. But as one did not view the yarns against the glass, but against a dark floor, there would appear to be more to be said for the alternative reason that such glass prevented a clear view and the workers' attention was not distracted. End windows in mule spinning rooms which threw cross lights between the spindles and destroyed the contrast between the light yarn and the dark floor were better omitted, especially in a south wall where the sun's rays were apt to scorch and even char the frame woodwork in highly heated rooms.

NEW BUILDINGS IN LONDON

Norbury.—POLICE STATION.—A new Police Station is now being erected near Norbury Station. The main building construction is of brickwork with Portland stone dressings. The sub-contractors are:—Portland stone, Messrs. F. Mortimer, Ltd.; steelwork and fireproof floors, Fawcett Construction Co., Ltd.; steel sashes, Messrs. Williams, Gamon & Co.; glazed bricks, Messrs. Leeds Fireclay Co.; artificial stone stairs, &c., Messrs. Patent Victoria Stone Co.; asphalte, Messrs. Lawford & Co.; wrot ironwork, Messrs. Clark, Hunt & Co. Mr. G. Mackenzie Trench, of Scotland Yard, is the architect. The builders are Messrs. A. E. Symes, of Carpenter's-road, Stratford, E.15.

Stratford.—DEPOT.—Messrs. Carter, Paterson, Ltd., are having a new depot at Stratford, which is to be the largest in the east of London. The architect is Mr. Leslie Carter. The buildings are executed in stock bricks and cement, comprising garage for a large fleet of lorries, stabling for 60 horses, with smithy, granary, &c., all complete. Also extensive loading bank with strong room and offices at end, including house for manager and roads all round. The sub-contractors are:—Stocks and cement, Messrs. J. Byford & Son, Ltd.; steelwork, Messrs. A. J. Main & Co.; roller shutters, Messrs. Adams & Co.; roofing, Messrs. Turners Asbestos Co.; glazing, Messrs. British Challenge Glazing Co. Messrs. A. E. Symes, of Carpenter's-road, E.15, are the builders.

Edgware-road.—BUILDING.—Shops and flats are being erected at 108–110, Edgware-road and 28, 29, 30, Upper George-street, W.1. The building is being constructed of brick with stucco dressings, reinforced floors by Messrs. Frazzi. Lifts (passenger and service to flats) are by Messrs. Waygood-Otis, together with the enclosure. Electric work by Messrs. Pinching & Walton; ranges and grates and mantels, by Messrs. Nicholls & Clarke; steelwork, by Mr. A. J. Bridle, 72, Victoria-street. Quantity Surveyor, Mr. Alan W. Davison, F.S.I., Belgravia Chambers, Victoria-street, S.W.1. Shop fittings by Messrs. E. Pollard & Co., Ltd. The demolition work is by Messrs. H. Sabey & Co. The general contractors are Messrs. Shurmur & Sons, Ltd., of Upper Clapton, E.5. Mr. L. S. Sullivan, F.R.I.B.A., of 158, Fenchurch-street, E.C.3, is the architect for the work.

Kentish Town-road.—REBUILDING.—Premises are being rebuilt for Messrs. C. & A. Daniels, drapers, at 174–178, Kentish Town-road. Mr. C. T. Armstrong and Messrs. Yates, Cook & Darbyshire are the joint architects for the work. The sub-contractors are: Steelwork, Messrs. Smith, Walker, Ltd.; fire escape staircase, pavement lights, &c., Messrs. Haywards, Ltd.; asphalte, Messrs. Thos. Faldo & Co., Ltd.; roofing, Messrs. Permanite, Ltd.; staircase balustrading, Messrs. Caston & Co.; heating, Messrs. James Slater & Co. (Engineers), Ltd. Messrs. T. H. Adamson & Sons, of High-street, Putney, are the builders.

RATES OF WAGES IN THE BUILDING TRADE

Port Talbot Building Association.

The Port Talbot and District Building Industry Association held their annual meeting recently. Mr. T. Rees (retiring President) presided. The following officers were elected for the ensuing year: President, Mr. A. G. Foley; Vice-President, Mr. T. Rees; Treasurer, Mr. Morgan Cox, jnr.; Auditor, Mr. S. Hussell; and Secretary, Mr. W. G. Davies. Messrs. Llewellyn Nicholas and D. Reynolds were appointed the Association's delegates to the Federation meetings; while Messrs. E. L. Reed, Llew. Nicholas, and Vaughan John were appointed to represent the Association on the Overtime Committee.

A letter was read from the Secretary to the operatives, pointing out that Federated Builders were employing non-unionist labour and com- plaining generally of the principle. After some discussion it was agreed to reply, stating that it had been brought to the notice of the Associa- tion that union operatives were working for non- federated builders and asking them to rectify that grievance.

A complaint was lodged by various builders who had undertaken to erect a number of houses under the Government subsidy scheme, that, although they had completed the build- ings, they had not yet been paid the subsidy money, nor the balance which was forthcoming under the Small Dwellings Acquisition Act. It was stated that the amounts due to some of the builders were considerable. It was agreed to send a deputation to see the Town Clerk. The delegates appointed were the President, with Messrs. E. L. Rees, Llew. Nicholas, Vaughan John, and the Secretary. The delegates attended before the Town Clerk and Chairman of the Housing Committee the following day, and it is hoped that the result will be productive of an early settlement.

PROPOSED NEW BUILDINGS & OTHER WORKS *

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

Cowgate and Rosebank Schools.

The following contracts have been placed in this competition for the installation of heating and ventilating systems :—Cowgate School, Messrs. J. L. Saunders & Co., Ltd., heating engineers, 259, St. Vincent-street, Glasgow, £1,207 18s. 2d. Rosebank School, Mr. T. P. Fimister, heating engineer, 55, South Tay-street, Dundee, £1,390.

Scottish Building Trade.

At a meeting in Glasgow recently of the Scottish Allied Building Trade Employers and the Scottish Regional Representatives of the National Building Trade Operatives, the question of hours and conditions was discussed. It was intimated at the close that the employers agreed to give the proposals of the operatives sympathetic consideration, and that the meeting stand adjourned until a day to be fixed by the joint secretaries. The operatives' proposals are :—(1) That a 44-hours' week be established in Scotland; and (2) that the operatives are prepared to put into operation the national working rules.

Widening Berkeley-street.

The Improvements Committee of the Westminster Council recently recommended the Council to proceed with a scheme for widening Berkeley-street, W., by the acquisition of part of the Devonshire House site. The cost of the land and necessary paving and other work was stated to be £85,000, of which sum £28,334 would have to be borne by the Council. The Ministry of Transport would bear one-third of its cost. The price of the land alone was £70,000.

Clacton Hotel Extensions.

The extensive alterations and additions to the Grosvenor Court Hotel, Clacton, having been completed, the proprietors (Mr. and Mrs. P. Clements) recently entertained the workmen, numbering nearly sixty, to dinner.

The firms concerned were Mr. F. W. King, builder; Messrs. Hember & Malby, electricians; Messrs. F. W. Lewellen & Co., furnishing and equipment.

THE SCOTTISH BUILDE

NEW BUILDINGS IN SCOTLAND

Paisley.—Houses.—The T.C. proposes to erect 102 houses. The District Board of Guardians have appointed Messrs. Ambercrombie & Maitland, County-place, Paisley, architects for a new mental defective institution to be erected on the Hawkhead Estate. The new building in the meantime provides accommodation for 100 patients and a plan of a further extension shows accommodation for 500.

Glasgow.—Housing.—The Corporation has accepted tenders amounting to £155,000 for a housing scheme in the Tollcross district.

Alloa.—School.—The Clackmannan C.E.C. is considering the architect's plans and an estimate at £1,450 for an addition to Ludgate School.

Edinburgh.—The University of Edinburgh has received an offer of a grant of £8,000 from the Miners' Welfare Committee, towards the provision of additional mining engineering laboratories and equipment, estimated to cost over £23,000.

Alva.—Addition.—The Clackmannan C.E.C. has issued instructions to the architect to obtain tenders for the various works required in connection with the erection of an addition to Alva Academy. The total estimated cost is between £6,000 and £7,000.

Dundee.—Extension.—The Corporation Police and Lighting Committee propose the extension to the central fire brigade station in Bell-street, so as to accommodate the whole of the permanent staff.

Montrose.—Housing.—The Town Chamberlain notified the Corporation Housing Committee that the sum of £95,000 would be required to complete the scheme. Only £80,000 has been sanctioned by the Board of Health.

Dumfries.—Houses.—The Dean of Guild Court has approved of plans for the erection of 100 additional houses on the Cresswell Estate, for the T.C.

Renfrew.—Houses.—The T.C. has obtained a site for the erection of 60 houses.

EDINBURGH COLLEG OF ART

Mr. Gerald Moira has recently been appo Director of the Edinburgh College of A fill the vacancy created by Mr. Frank M Fletcher's acceptance last year of the directorship at Sta. Barbara, California Moira will control the three-years' train about a thousand students, studying fo diplomas in painting, architecture, dr and design. The diplomas are regard equivalent to a University degree, th architecture exempting holders of it fro intermediate examination of the R. Mr. Moira was, of course, Professor of deco painting at the Royal College of Art, well-known as a decorative painter beginning of his decorative career, foll studentship in the Royal Academy Sc was the decoration, together with Mr. Jenkins, of the Trocadero Restaurant, series of mural paintings in London an provinces include those for Lloyd's Re the United Kingdom Provident Instit and the great lunettes and stained glass Central Criminal Court.

Aberdeen and Smoke Abatement.

The Aberdeen Chamber of Commerce rec had under discussion the Smoke Abate Bill. A letter was submitted from the burgh Chamber enclosing a copy of a sent by that Chamber to the Scottish Bo Health, with criticism by that Chamber o Bill at present before the House of Com The General Purposes Committee of the deen Chamber had, it was stated, instr the secretary to reply that their views we accord with the views expressed by the burgh Chamber, but that they would lik see more smoke coming from some of the fact and industrial chimneys, and that they th such a Bill might well be held over unti trade of the country improved. The Cha approved of this recommendation.

BUILDING TRADE WAGES IN SCOTLAND

The following are the present rates of wages in the building trade in the principal towns Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for er that may occur :—

TRADE NEWS

Messrs. Bryce, White & Co., Ltd., of Wharf-road, N.1, have for the convenience of their South Coast customers opened a new branch at Southampton. The address is as follows:—Bryce, White & Co., Ltd., Emsworth Works, Leighton-avenue, Shirley, Southampton. Telephone: Southampton 4971.

The Holborn Sanitary Company (whose registered trade mark is "Hosanco") have, owing to increased trade, taken more commodious premises at Sardinia House, Kingsway, W.C.2.

Messrs. William Shepherd & Sons, Ltd., Milkstone, Rochdale, inform us that an Australian firm has recently placed with them an order for 1,000 gallons of "Shepfast" Composition. This material is for use in connection with Australian wood block flooring contracts.

The firm of Winget, Ltd., has recently been reconstructed as "Winget (1924), Ltd.," under the control of its founder, Mr. J. Faulder Burn, who remains chairman and managing director of the new company.

The London office of Messrs. Matthews & Mumby, Ltd., reinforced concrete engineers and contractors, has been removed from Feather-stone-buildings, Holborn, to 36, Furnival-street, E.C.4. Their new telephone number is Holborn 4982. Mr. Hamilton Smith will continue to act as their London manager.

For the convenience of architects and contractors in the Midlands, Messrs. Horace W. Cullum & Co., Ltd., the manufacturers of "Cullum" floors, are opening offices in Warwick Chambers, Corporation-street, Birmingham.

"The Gazeway," Surbiton.

The Queen of Roumania, accompanied by the Infanta Beatrice of Spain, recently spent nearly an hour in going round the show house and gardens known as "The Gazeway," Surbiton. Her Majesty expressed pleasure with all she saw; the gardens are looking delightful at present, and Her Majesty is placing an order for a consignment of the varieties to be sent out to Roumania. The Children's Garden also called for attention, and the "All Weather" hard tennis court provoked much interest. The house itself, with its selection of antique and modern furniture set out in rooms decorated particularly to show the value of colour used in the home, next called for attention.

Unemployment and Spring and Winter Painting.

The Minister of Health draws our attention to the fact that unemployment among painters and other tradesmen normally engaged in work of internal decoration is much higher in the winter than in the summer. In a circular issued by the Ministry it is very truly stated that "There would be manifest advantage if an effort were made to spread throughout the year the work which is available. The Government, therefore, wish to urge local authorities that, so far as it may be practicable to do so, they should arrange that painting and other work of internal decoration is not put in hand during the spring and summer, when there is usually a full demand from other sources for painters, &c., but that they should arrange to have such work done during the late autumn and winter months, when the opportunities for employment are less. The Minister is of opinion that the general gain if local authorities would adopt this suggestion would outweigh any advantage which might accrue from following the normal course of doing internal painting work during months of fine weather. He trusts, therefore, that local authorities will take all possible steps to postpone work of the kind mentioned which is contemplated during the next few months, in order that it may be put in hand during the winter months of 1924–25, and will adopt the same policy in subsequent years."

TENDERS

Communications for insertion under this heading be addressed to "The Editor," and must reach h later than Tuesday evening.

* Denotes accepted. † Denotes provisionally ac
‡ Denotes recommended for acceptance.
§ Denotes accepted subject to modifications.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

XXVI.—No. 4244. JUNE 6, 1924.

THE R.I.B.A. ELECTION

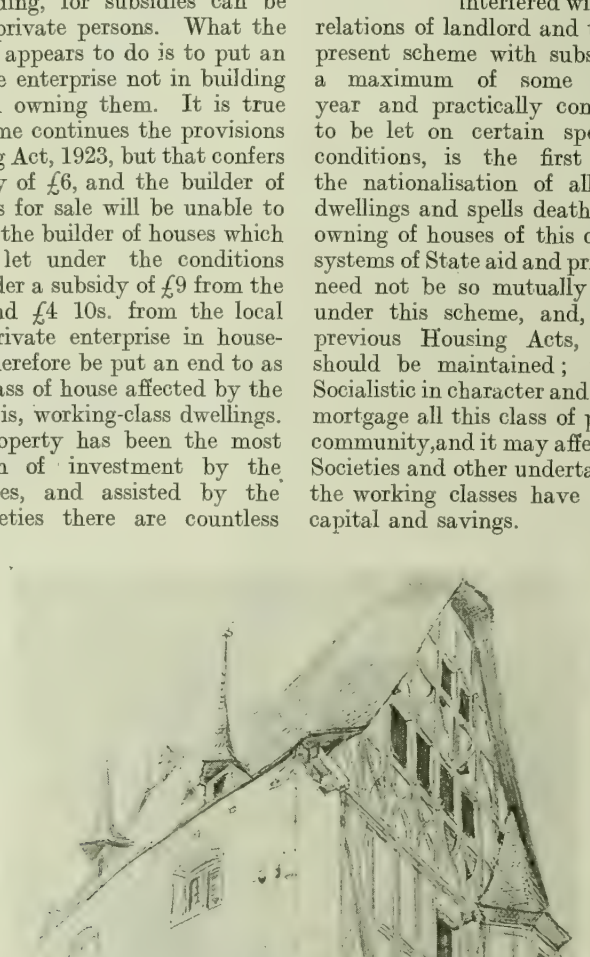
THE appeals which have been made to the electorate of the Royal Institute of British Architects to record their votes for or against the policy of the present Council have not been made in vain, and although there are still too many members who have not taken public to vote on a subject which is of vital interest to architects, the vote which has been recorded by the active members of the Institute shows that at least as much interest has been taken in this election as the last. The result of the for the Council and the Standing Committees was made at the meeting of the Institute on Monday, and, as will from the figures which we give on p. 903, the policy of present Council of amalgamation with the Society of tects as a necessary preliminary step in an attempt to registration of architects by Act of Parliament has been tically endorsed by a three to one majority. In recording sult we do not deny our satisfaction that the electorate have taken what we believe to be the long view, and by vote have at once lifted a debating issue into the realm ctical politics.

the course of the discussion on the amalgamation pro- of the present Council many interesting and often versial issues have been raised, and in dealing with as they have arisen we have endeavoured to keep the issue before our readers and, we believe, judging by the just recorded, the electorate have done the same, and same time have given as emphatic a declaration of their ns and wishes as could be expected in the circumstances. ssues between the two parties in the Institute have been considered, and we have now had a deliberate verdict by a well-informed electorate, and although the question disposed of it has been carried a long way forward by cceptance of the Council's proposals, made in agreement the Council of the Society of Architects, for amalgamation the Society.

controversial discussions points of difference can be so asised and exaggerated that the main issue is often lost of. The Institute's policy can be attacked, as we know been and will be, from several points of view, but that appears to us to be founded on very sound logic. If tration for all qualified architects is desired by the pro- n as a whole, and we know it is, and the best if not the only to obtain the necessary Act of Parliament is, according minent Counsel, by amalgamation with the Society of tects, an independent body which was formed many ago with the avowed object of securing Registration, it follows that those members of the Institute who desire tration for architects had no alternative but to vote e proposals of the R.I.B.A. Council. We do not express wn opinion on the subject of Registration, but we do that it is desired by the profession as a whole. We that from the plebiscite taken by the Society of Architects ubsequently by ourselves. We also know that without ted professional backing there is a very remote chance taining it: "There is a reasonable probability," Mr. t, K.C., tells us, "with a reasonable good case on public ll as professional grounds," if amalgamation takes place. opinion, of course, assumes that the proposed amalgama- vill be carried out, without which the difficulties would be much greater"—an opinion which is held by other lawyers as well as those familiar with Parliamentary procedure and the efforts of other bodies to obtain statutory registration.

We are familiar with the opinion of those members of the R.I.B.A. who believe that the amalgamation proposals of the Council will, if carried into effect, lower the status of the Institute and prejudicially affect the Associate class of members, but these views are clearly not shared by the majority of the electorate, who have no doubt been influenced by the experience of the United States and the Dominions, which have had practical experience of the effect of Registration. We cannot ignore the fact that there are registration laws in 23 of the United States, not one of which has been repealed, and that, as a result, it is claimed for Registration that the standard of architecture has been greatly improved as well as the position of architects; while in the Dominions the results have been much the same.

While the endorsement by the electorate of the policy of the Council of the Institute is a hopeful fact which encourages the belief that we now have a chance of getting something of practical value done for the benefit of the profession, we do not forget that the proposals have yet to be endorsed by a Special General meeting of the Institute and finally by the Society of Architects. We understand that the meeting will be held on June 17, at 3 p.m. (see p. 903), when it is to be hoped the verdict obtained by the vote just recorded will be confirmed. There will doubtless be a record attendance of members at the general meeting, and every opportunity should be given for the discussion of details of the Council's proposals with the object of obtaining, if possible, the largest measure of agreement. We cannot be indifferent to the sincerity of many of those who do not agree with the Council and who have voted against their proposals, and we cannot help thinking that some at least of their doubts can be removed by friendly discussion and explanation. If the recent correspondence in our own columns may be taken as at all typical of the objections to the proposals, we are entitled to conclude that much of this objection is due to misunderstanding and misinterpretation, much of which could surely be removed. At the same time, we would appeal to those who have been and are opposed to the proposed amalgamation. As we said in our last issue, we believe the members of the profession desire to make an end of the interminable arguments with which we have been made familiar for so many years and go forward with a practical policy on which the great majority of the profession are at one, and from which it is possible to hope for really useful results within a reasonable period. What we said last week appears to be amply confirmed by the result of the election. We have had too much destructive criticism, and we cannot help thinking the time has arrived when all men of good will should work together for the common good of the profession. We have now had two elections which appear to indicate that the present Council have the support of the majority of the members. Last year the election was fought on a policy of unification, but a policy which had not been clearly defined. This year the Council have been returned on a clearly-defined policy, the principal item of which is amalgamation with the Society, and this policy has received the support of a substantial majority of the members who have recorded their vote. Is it too much to ask those in opposition to the Council, against whom the verdict of the electorate has gone, to abandon their opposition and, if they cannot actively support, do nothing to hinder the efforts which will be made to give effect to the wishes of the majority?



NOTES

The Housing Scheme.

THERE are so many points to be considered in the White Paper containing the financial proposals of the Government connected with the housing scheme that they can only be dealt with piecemeal, and in the present note we only desire to call attention to one aspect of the question. It has already been pointed out in certain quarters that the scheme will "put an end to private enterprise," but this statement being too wide will receive an answer that the proposals in themselves do recognise private enterprise in building, for subsidies can be obtained by private persons. What the scheme really appears to do is to put an end to private enterprise not in building houses but in owning them. It is true that the scheme continues the provisions of the Housing Act, 1923, but that confers only a subsidy of £6, and the builder of private houses for sale will be unable to compete with the builder of houses which can only be let under the conditions prescribed under a subsidy of £9 from the Exchequer and £4 10s. from the local authority. Private enterprise in house-owning will therefore be put an end to as regards the class of house affected by the scheme—that is, working-class dwellings. Yet house property has been the most favoured form of investment by the working classes, and assisted by the Building Societies there are countless numbers of small property owners. This has always appeared desirable from many points of view. The property owner has a stake in the country in the government of which he has a voice, and the owning of house property attaches labour to the district and tends to encourage fixity of employment, and to discourage the engagement of casual labour.

The Nationalisation of Working Class Houses.

IT is certainly desirable that a great many more houses should be available to be let for occupation than is at present the case since the Rent Restriction Acts have interfered with the ordinary relations of landlord and tenant, but the present scheme with subsidies rising to a maximum of some £32,000,000 a year and practically confined to towns to be let on certain special and fixed conditions, is the first step towards the nationalisation of all working-class dwellings and spells death to the private owning of houses of this class. The two systems of State aid and private enterprise need not be so mutually destructive as under this scheme, and, as under the previous Housing Acts, both systems should be maintained; the scheme is Socialistic in character and will practically mortgage all this class of property to the community, and it may affect the Building Societies and other undertakings in which the working classes have invested time, capital and savings.

ish t. THE depression which is prevailing in the case of contemporary English art is a phenomenon not to be ked. It can hardly be a money n, as the sale rooms afford ample es of the amount of money spent pictures. It is for some reason se that the prestige of modern painting is rather in eclipse. interpretations are forthcoming ain this, such as that the public ken alarm from the vagaries of the xtremist theories about art at the time, or is it that we have to our interpretations about art? omotion of a certain kind of crafts- p has produced a certain kind of and some loss of prestige results n overstocked market. There is oduction in directions in which the of art is of little account. This is ve think, in the too ready adapt- to the habit and vogue of the time. ue artist needs fearlessly to empha- is own differing point of view. ıated to the ordinary aims of the ude, we forget that art is not a ss, and in his endeavour to reconcile s irreconcilable, his work lacks the ties of significance and spiritual ity which give it prestige. To s fine in art the world will in the end bow. The pursuit of a too- nodating adaptability to what the s reputed to want robs the artist of edom of his work. We hear of the rs entering the Academy on var- day whom no one would take to sts—so much the worse, in a sense. the arts become respectable, taking ssing colour of the time, its fashion modes, they are dying.

·ete at bley. THE austerity of the con- crete Palaces and of the Stadium at Wembley form a striking contrast to the sual type of white classical building, s the Canadian Pavilion. We are nes told that the unity of the ion would have been better served alaces of Engineering and Industry en whitened or washed to a cream leaving the Stadium alone to te the scheme as a mass of grey e. Many hold that the colour of concrete is ugly in itself; but is it not one of Nature's favourite shades? We find the same colour in limestone, and even in granite when seen from a distance. When it has had ample time to weather, concrete attains a fine mellow appearance, and since it is our principal new material we must learn to make the best of it and give it the chance of arriving at the maturity that time alone can bestow.

Old London Bridge. THE Wembley reproduction of the old cobbled bridge with shops on each side reminds us of the possibility of building such a bridge to-day, at Charing Cross or elsewhere. Mr. T. E. Collcutt, in "London of the Future," compares the open bridge and its dreary waste of road nearly half a mile in length, with no shelter from wind and rain, with the alternative of providing a shelter of covered colonnades, lined with shops, thus creating a mile of valuable property. Nowhere is the passer-by so fully exposed to the buffeting of wind and sleet as on crossing the river, and nothing could so efficiently bind together the two banks as a bridge lined with shops that presented the appearance of an unusually pleasant street. The possibility of building such a bridge should not be overlooked.

A Bottle-Neck. WE understand that Berkeley-street is to be widened. It takes more than a casual glance at the map to demonstrate the importance of this little street as the main artery for through traffic from Paddington to Charing Cross. The jamming of traffic at the Piccadilly end is nearly as bad as that experienced at Wellington-street in the Strand. The widening of Berkeley-street will, of course, help to ease the traffic, but Piccadilly itself is none too wide at the junction and it is difficult to see how the constant blocks at this point can be avoided.

A Wren Memorial. NOT content with the most striking memorial which the genius of Wren could have ever received, in the words, "Si monumentum requiris, circumspice," it is now suggested that the Architectural League of New York should place a memorial tablet to Wren's memory in the Cathedral. It would not be a gracious task to refuse such a tribute, neither is it an altogether agreeable thing to destroy something of the significance of those words which have sufficed for two centuries. It is possibly a matter of feeling and taste which is pretty evenly divided.

Open Spaces. THE appeal now being made for the purchase of the White City as an open space and playground, whether possible or not—and we see no reason why it should be thought impossible—

Sketch in Nuremberg.

From a Sketch by MR. WALTER MILLARD, F.R.I.B.A.

directs attention to other spaces, unoccupied for one reason or another—spaces which laid out with lawns and trees would add so much to the health and pleasure of the people. We know nothing of the financial possibilities, but a public spirit enlightened enough to desire these improvements is certainly on the way to getting them. The appeal is one which should be appreciated by the owners of these sites to offer their aid in the purchase. Other well known sites suggest themselves; such as the old Post Office site in the City, which we never pass without a yearning to see this barren spot, defaced by hoardings, made into a leafy garden retreat, in a neighbourhood so congested and far from nature. This property, which we take it belongs to the Crown, might be bestowed on the people in this way, as an addition to their inheritance. At Earl's Court is another site which it has been suggested should be acquired—the old exhibition ground; in such a locality, deprived of much open space or recreation grounds, it would be an immense improvement to the neighbourhood. Our public spirit cannot be better exercised than in assisting such undertakings, and we believe that the growing desire for such improvements should bring them to pass. We are, therefore, glad to see the attention now being bestowed on the subject.

GENERAL NEWS

Professional Announcement.

The partnership between Mr. A. G. Bond, F.R.I.B.A., and Mr. Gilbert Scott Cockrill, A.R.I.B.A., has been dissolved by mutual consent as and from April 1. Mr. Bond will continue to practise at 115, Gower-street.

Architect's Estate.

Mr. Thomas Wardlaw, of Wesley-street, Waterloo, Lancs., retired architect and surveyor (net personalty *nil*), £10,985.

Sir Aston Webb.

It is stated the condition of Sir Aston Webb has shown decided improvement during the past week, and he is progressing as well as can be expected.

Obituary.

Mr. John William Cockrill, M.Inst.C.E., A.R.I.B.A., died recently at the age of seventy-five. For fifty-three years he had been in the municipal service of Great Yarmouth as Surveyor and Architect.

Birthday Honours.

The first list of King's Birthday Honours bestowed in the administration of a Labour Government was issued recently. Among the new Knights are Mr. David Young Cameron, R.A., LL.D., in recognition of his contributions to art, and Mr. John Sulman, F.R.I.B.A., of the City of Sydney (Chairman of the Canberra Advisory Committee), in recognition of his services to the Commonwealth of Australia. Mr. Charles Reed Peers, Chief Inspector of Ancient Monuments, receives the honour of C.B.E. (Civil).

Northern Architectural Association.

Members of the Northern Architectural Association had their second outing of their summer programme on May 29, when they visited the Lord Roberts' Memorial Workshops for Disabled Soldiers and Sailors, in Orchard-street, Newcastle. They were received by the local general manager, Mr. J. Currie, and toured the works inspecting a large contract for boundary railings, balcony railings, and staircases which is being carried out for the Rochester-street housing scheme, and also viewed some excellent specimens of ornamental work turned out by men at the workshops.

Central School of Arts and Crafts.

The annual exhibition of the work of the session will be open from June 2–28, 10 a.m. to 8 p.m. daily; Saturdays, 10 to 12 (noon). Admission is free on signing the visitors' book. The exhibits include work in architecture, furniture, wood and stone carving, stained glass, pottery, embroidery, tapestry and other weaving, silversmithing and allied crafts, writing and illumination, printing, bookbinding, wood engraving, book illustration, etching, lithography, miniature, drawing, modelling, and design.

Tablet to Wren.

A tablet in memory of Sir Christopher Wren, presented by the Architectural League of New York, will be unveiled in St. Paul's Cathedral by the American Ambassador on June 30, at 2.30 p.m. The arrangements for the presentation have been made through Mr. Alfred C. Bossom, an American architect, who is on his way to England from New York. The tablet bears the following inscription :—

"In recognition of the inspiration and enduring influence on American architecture of the work of Sir Christopher Wren, this tablet is inscribed by the Architectural League of New York."

Art Students in Industry.

The Federation of British Industries has, through the work of its Industrial Art Committee, recently established, at its head office, an employment bureau for students from art schools. This bureau will not deal with the great bulk of students who normally find employment in the localities in which they are trained, but will confine its activities to students whose exceptional capacity marks them as suitable to become original designers or—given the requisite practical experience—to occupy important positions in industry. Lists (accompanied by specimens or photographs of work) of candidates desiring industrial or commercial employment, and considered to be fitted for such work, will be supplied by the art schools throughout the country

Mr. F. W. Pomeroy, R.A.

A memorial service for Mr. Frederick W. Pomeroy, R.A., was held on May 30, at St. James's Church, Piccadilly. Among those present were Mrs. Pomeroy (widow), Sir H Hughes-Stanton, Sir Frank Short, Sir R Blomfield, Sir Bertram Mackennal, Sir Cope, Sir David Murray, Sir William an Llewellyn, Sir W. Goscombe John, Si Lavery, Mr. Adrian Stokes, Mr. Solo Solomon, Mr. W. Curtis Green, Mr. Leo Merrifield, Mr. J. W. Mackail, Professor Anning Bell, Mr. Louis de St. Quent Arthur D. Rendall (Imperial Arts L Mr. Reid Dick, Mr. A. Forbes Sievekin W. Reynolds Stephens (President Royal of British Sculptors), Captain and Mrs. Jones, Mr. R. Maitland Lamb (Secretary Royal Academy), Mr. Frank Dicksee, Mr. Perks, and Mr. Mervyn Macartney.

COMPETITION NE

Glasgow High School Memorial.

Competitive designs are invited for a m club house and pavilion to be erected ground of the Glasgow High School Anniesland, Glasgow. The competition fined to former pupils of the High Sc Glasgow. Premiums of £150 £100 a are offered respectively. Mr. John F.R.I.B.A., Glasgow, has been appoin sessor. Particulars and plans may be o from Mr. H. R. Buchanan, 172, St. V street, Glasgow. (See advertisement this

Sidmouth Housing Scheme.

The conditions of this competition in accordance with the R.I.B.A. Regul

Southampton Town Hall.

Mr. H. Austen Hall, F.R.I.B.A., ha appointed assessor in this competition.

Other Competitions.

Other competitions still open inclu following (the dates given are, first the in date, and second the issue of *The Bu* which full particulars were given) :—(n Designs (June; Dec. 21, 1923). Ros Memorial (Sept. 30; Feb. 21). Glasgow Hall (July 4; May 2). Football St Edinburgh (June 9; May 23). Ha Infirmary (Sept. 30; May 30). Bexhill tainment Hall (Sept. 1; May 30). Ha War Memorial (Sept. 1; May 30).

Glasgow War Memorial. SIR JOHN BURNET, A.R.A., SON & DICK, Architects.

some form it seems only right that we
gland should render this tardy justice
sts whose works have often fetched
20 years of their first sale a hundred
more than was originally paid for them,
any benefit accruing to the artist or
rs. This and many other matters
areful consideration by every section of
ofession, and, when a decision has
rrived at, then it needs a body such as
onfederation, which has the support
of half a million professional workers
e islands, to see that their decision
s law.

British Confederation of Art is holding at Wembley on June 25, its second annual conference, to which the art societies of the Empire are invited, and the chief speaker on this occasion will be M. Louis Gallié, representing the two million organised intellectual workers in the International Confederation. He will explain the whole movement and tell us what it has done in other countries: also he will tell us the results of his two official visits to the League of Nations at Geneva. Mr. Brereton, chairman, Mr. H. V. Lanchester, F.R.I.B.A. (Architecture), Mlle. Genée (Dancing), Mr. Austen Harrison (Literature), Mr. Geoffrey Whitworth (Drama) are among the speakers. But the main feature of the conference will be the hearing from the delegates of the societies represented what the Confederation should do for the arts concerned. Further particulars can be obtained from the Organiser of Conferences, Wembley, and from the Hon. Sec., B.C.A., 95, Belgrave-road.

AMELIA DEFRIES.

Valuation Office, Inland Revenue, War Memorial. By MR. W. GRAILY HEWITT.

[This memorial was unveiled by Lord Plumer on May 28.]

THE LATE H. HEATHCOTE STATHAM

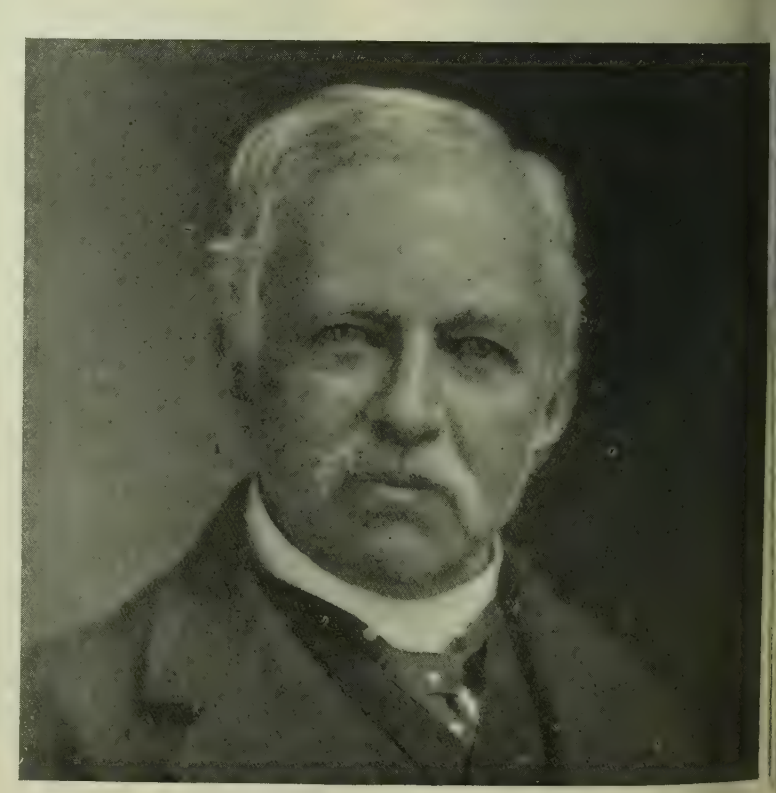
It is with much regret we announce the death of Mr. Henry Heathcote Statham, F.R.I.B.A., who passed away last Friday at Torquay in his 86th year. Mr. Statham had many claims to distinction, but he was probably best known as a former Editor of *The Builder*, a position which he occupied for a quarter of a century. The son of a Liverpool solicitor, he was born in that city in the year 1839, was educated at Liverpool Collegiate Institution, and received his architectural training in the office of George Williams. He subsequently practised in Liverpool for a short period, and about this time he became a contributor to *The Builder*, which was then edited by George Godwin, on whose suggestion, at the age of thirty, Mr. Statham removed to London and devoted most of his time to writing. In fact, as he told the writer of this notice, he preferred writing to architectural work, and although he subsequently prepared some admirable architectural designs in competitions, which were not carried out, his gift was for literary work. On the retirement of George Godwin, after 42 years of editorship, Statham was appointed his successor, and his facile pen had free scope in the development of his ideas, not only on innumerable architectural and professional subjects, but on most subjects of interest to an educated person. His industry was amazing and few men could have worked as hard, as methodically, as unsparingly of himself and as conscientiously. Leading articles, competition and book reviews, articles on art and science, building and the crafts, notes, and even news paragraphs, were written with an apparent ease which was made possible only by a vast accumulation of knowledge and a logical and orderly mind. Those who knew him well and have conversed with him, and even those who read his articles, must have realised that he thoroughly believed in himself, and if this made him appear to be somewhat dogmatic in speech—for he was quite an accomplished public speaker—as well as in his literary work, it was rather the dogmatism of knowledge than of mere opinion. Such was his energy that during his period of editorship he found time not only to write for and edit *The Builder*, but to contribute essays on artistic, musical and literary subjects to such periodicals as the *Edinburgh* and *Fortnightly Reviews* and the *Nineteenth Century*. He also read a good many papers before the Royal Institute of British Architects, the Architectural Association, the London Institution, the Royal Society of Arts, the Royal Institution, and other bodies. He was also a writer on musical subjects as well as an amateur musician of considerable ability. He contributed to Groves' Dictionary of Music, was for many years musical critic to the *Edinburgh Review*, and for several successive years gave classical organ recitals at the Albert Hall on Sunday afternoons, and was organist for a time at St. Jude's Church, Whitechapel. His literary work was not limited to editing or to the writing of newspaper and magazine articles, for he was the author of the following publications, all but one written, we believe, during his editorship of *The Builder*, and indicating the wide range of his interests as well as his immense energy:—"Architecture for General Readers," "Modern Architecture," "Architecture Among the Poets," a reprint of articles first published in our own pages, "The Changes in the London Building Act of 1894," "My Thoughts on Music and Musicians," "Form and Design in Music," "Winged Words"—a collection of essays on various subjects, published anonymously and exciting a good deal of interest as to their authorship—"The Organ and Its Place in Musical Art," "A Short Critical History of Architecture," and "What is Music?" a short analysis for the general reader.

That he was an exceptionally versatile and energetic man will appear from this record. But it must not be supposed that his interests were altogether confined to literature. He not only designed and carried out several architectural works, including the refronting of *The Builder* offices, but he prepared an interesting design for remodelling the front of the National Gallery and laying out Trafalgar-square, which was published in *The Builder*, as well as a design in collaboration with Mr. John Slater in the important competition for Edinburgh Municipal Buildings, and a competition design for Sheffield Municipal Buildings.

He also made drawings of several of the English Cathedrals for our Cathedral series, and various characteristic designs indicating the poetical and imaginative side of his nature, which were published at intervals in our pages. He took great interest in bridges and published several designs for bridges to cross the Thames, in which his theories of design were indicated.

An Associate of the R.I.B.A. from 1871 and a Fellow from 1878, he was thus one of the oldest members. He was also a member of the Architectural Association, the London Society, the Oxford and Cambridge Musical Club, the Musical Association, and a Fellow of the Royal Philharmonic Society. He was married in 1887 to the youngest daughter of W. Stephens Dicken, Deputy-General Inspector of Hospitals, East India Company's service, and had four sons (two of whom were lost in the war) and two daughters.

It is impossible in a short article to mention all the activities which characterised his long and energetic life. That he occupied a distinguished position in the profession our readers know, but that he received the recognition which his work and abilities justified we doubt, though we do not forget that when he retired from the editorship of *The Builder* the following tribute was paid to him by the Council of the Royal Institute of British Architects: "The Council desire to express their appreciation of the services he has rendered to architecture and the high ideals he has kept steadily in view in his conduct of that journal." We believe that to be a just tribute. Those who knew him well could not fail to appreciate his great ability and above all his high standard of honour, and if he sometimes practised too literally William Blake's motto, "Always be ready to speak your mind and a base man will avoid you," he was a fair as well as a keen controversialist, while a somewhat reserved manner served but to conceal a warm and affectionate nature.



Since *The Builder* was edited by H. H Statham the world has changed so gre we can hardly yet realise to what exten hope and believe that the principles ideals which he had before him will neve and that at least in these pages they wi be upheld and cherished.

We have received the following appr from three of Mr. Statham's friends.

Professor Beresford Pite, F.I writes:—

Mr. Statham, among architects, sto His character had singularity. He that he desired to be feared as an ec loved as a man, a combination of id may explain some difficulties. He w fiably conscious of his superior in equipment, and he would not have un criticism with such fearlessness if he doubts of the essential fairness of his ju Apparently he was unaware of the sympathies and enthusiasms of the s his earlier days. He could look upon Shaw's work from a detached view-p his brethren did not know how to attai Webb and the subtler influences of but powerful school had little force estimate of contemporaries. But his enjoyment of the French School did him to desire its transplantation to and the eclecticism of his mind strugg the problems of architectural composit design *in vacuo*. He systematised ornam lectured on its "theory," experiment it in a few buildings, of which *The* office and a lodge at Golders Green Par late Sir Spencer Wells remain. A f petition designs carried out his original of an architecture based upon private d of these one for Edinburgh Municipal B may be instanced. Occasional ima designs made annually on Boxing D drawn around some well-studied pas poetry, often from Browning. His archi outlook was as unique and as deserving o as his character.

Apparently among musicians his sta similar. To devote his acknowledged a great organist to Bach has been insta characteristic. For many years he was honorary organist to Canon Barne

urice B. Adams, F.R.I.B.A., writes :—
be allowed a brief space to add a
s in recognition of the journalistic
my contemporary, H. H. Statham,
th at the mature age of 85 is announced
Times ? My intrusion in your pages
justified by my long experience as a competitor of his in the field of architectural journalism, about which much, of course, might be said, though this is neither the time nor place for any such dissertations. They certainly were varied by not a few amusing incidents, and some misunderstandings between us happened occasionally. When Heathcote Statham retired from the editorship of *The Builder*, I took my part in the movement which was spontaneously started by other members of the R.I.B.A. Council, whose names as subscribers he never knew. He, however, sent Mr. Curtis Green, who acted as Hon. Sec., a circular note of grateful thanks and acknowledgment, expressing his satisfaction that his "efforts during many years to keep a high standard in a journal representative of architecture have been thought to justify this kind and generous recognition." A copy of this paper is now before me, kept as a memento.

Soon after Statham arrived from Liverpool I became acquainted with him as a contributor to the *Building News*, when he was about 35 years of age. Subsequently he joined *The Builder*, so that I frequently met him at different places when reviewing exhibitions and competitions. His just criticisms and knowledge of such artistic and technical subjects were consequently very familiar to me. I reckoned his work highly, and considered it well done.

The last letter I received from Statham was dictated, he not being able to write personally. He said he "had lived well past three score years and ten, having reached the age of 84 a few days ago." "I have had my fair share of life, but my mind and my interest in things artistic is as active as ever. It was very good of you to send me your most welcome and kind-hearted letter, for which I thank you very much. You bring back to me many old memories of the days when *The Builder* stuck to wood engraving. Two or three years before I became editor I made efforts now and then to break Godwin's adherence to that, but I found these attempts put him in a bad temper. I like wood engraving myself when it is not too mechanical, and Brewer's subjects were generally much better engraved than the rest."

The illustrations of the professional press have, of course, changed vastly during my 51 years of active journalism, during which Statham's editorship extended to 25 years. The developments since he resigned have been enormous.

MAURICE B. ADAMS.

R.I.B.A. ANNUAL ELECTIONS, 1924-25

THE COUNCIL.

PRESIDENT.

Mr. John Alfred Gotch, 1223 votes.

VICE-PRESIDENTS.

Sir Edwin Lutyens, 1,302 votes ; Mr. E. Guy Dawber, 1,298 ; Major Harry Barnes, 1,234 ; Mr. H. T. Buckland, 1,213.

HONORARY SECRETARY.

Mr. Arthur Keen.

PAST PRESIDENTS.

Sir Reginald Blomfield, R.A., Mr. Paul Waterhouse.

MEMBERS OF COUNCIL.

Fellows.—Sir John James Burnet, 1,251 votes ; Mr. H. V. Lanchester, 1,227 ; Mr. W. Cave, 1,211 ; Mr. W. Curtis Green, A.R.A., 1,210 ; Professor S. D. Adshead, 1,205 ; Mr. G. Gilbert Scott, 1,173 ; Mr. H. V. Ashley, 1,145 ; Sir Banister Fletcher, 1,138 ; Major H. C. Corlette, 1,131 ; Sir A. Brumwell Thomas, 1,119 ; Mr. F. T. Verity, 1,113 ; Mr. J. Keppie, 1,097 ; Mr. H. M. Fletcher, 1,089 ; Mr. Francis Jones, 1,080 ; Mr. P. E. Thomas, 1,069 ; Mr. T. Taliesin Rees, 1,062 ; Mr. E. J. Sadgrove, 1,037 ; Mr. E. C. P. Monson, 999.

Associate Members of Council.—Mr. L. H. Bucknell, 1,220 votes ; Professor L. B. Budden, 1,208 ; Mr. M. T. Waterhouse, 1,208 ; Mr. H. C. Bradshaw, 1,206 ; Mr. J. A. Slater, 1,204 ; Mr. H. Bagenal, 1,179.

Representatives of Allied Societies.—Mr. A. J. Hope (Manchester) ; Mr. W. T. Jones (Northern Association) ; Mr. G. A. Paterson (Glasgow Institute) ; Mr. R. M. Young (Ulster Society) ; Mr. G. C. Lawrence (Wessex Society) ; Mr. J. S. Harrison (Leicester and Leicestershire Society) ; Mr. E. B. Kirby (Liverpool Society) ; Mr. H. L. Paterson (Sheffield Society) ; Mr. E. P. Warren (Berks, Bucks and Oxon Association).

Representative of the Architectural Association.—Mr. Harry Stuart Goodhart-Rendel.

ART STANDING COMMITTEE.

Fellows.—Sir J. J. Burnet, 932 votes ; Messrs. E. G. Dawber, 882 ; H. V. Lanchester, 879 ; S. D. Adshead, 854 ; G. Gilbert Scott, 817 ; W. Cave, 789 ; Halsey Ricardo, 612 ; F. M. Simpson, 589 ; H. A. Hall, 488 ; F. W. Newman, 482.

Associates.—Messrs. C. A. Farey, 1,122 votes ; L. H. Bucknell, 1,102 ; M. T. Waterhouse, 1,036 ; P. W. Lovell, 995 ; W. H. Thompson, 956 ; T. S. Tait, 947.

LITERATURE STANDING COMMITTEE.

Fellows.—Messrs. H. M. Fletcher, 996 votes ; H. C. Corlette, 975 ; E. S. Hall, 945 ; M. S. Briggs, 886 ; D. T. Fyfe, 880 ; C. H. Townsend, 864 ; A. Stratton, 848 ; L. Ambler, 825 ; C. S. Spooner, 816 ; W. H. Ansell, 792.

Associates.—Messrs. J. H. Worthington, 1,037 votes ; H. C. Bradshaw, 955 ; J. A. Slater, 955 ; C. Cowles-Voysey, 839 ; P. W. Hubbard, 807 ; A. T. Edwards, 741.

PRACTICE STANDING COMMITTEE.

Fellows.—Messrs. Arthur Keen, 1,065 votes ; H. V. Ashley, 906 ; D. B. Niven, 749 ; T. R. Milburn, 724 ; F. Jones, 697 ; G. H. Lovegrove, 686 ; G. H. Grayson, 675 ; Max Clarke, 645 ; W. Gillbee Scott, 624 ; F. Chatterton, 597.

Associates.—Messrs. H. W. Cubitt, G. L. Elkington, H. V. M. Emerson, J. D. Scott, H. A. Welch, C. Woodward.

SCIENCE STANDING COMMITTEE.

Fellows.—Messrs. W. A. Pite, 967 votes ; A. E. Munby, 870 ; H. T. Buckland, 865 ; R. Unwin, 861 ; R. E. Smith, 853 ; H. D. Searles-Wood, 819 ; J. E. Dixon-Spain, 730 ; R. S. Ayling, 636 ; W. E. V. Crompton, 588 ; D. L. Solomon, 575.

Associates.—Messrs. H. Bagenal, 1,120 votes ; H. W. Burrows, 1,104 ; P. W. Barnett, 1,035 ; R. J. Angel, 1,016 ; H. R. Sayer, 972 ; T. F. Ford, 949.

The Proposed Amalgamation.

A special general meeting of the Royal Institute of British Architects is to be held at Caxton Hall, Caxton-street, Westminster, on June 17, at 3 p.m., for the purpose of considering, and, if thought fit, passing the subjoined Resolution No. 1 ; and also for the purpose of considering, and, if thought fit, passing the subjoined Resolutions Nos. 2 and 3 respectively, approving with or without modifications the draft Supplemental Charter and new By-laws which will be submitted to the meeting. Should the said Resolutions be passed by the requisite majority, they will be submitted for confirmation to a further special general meeting to be subsequently convened.

(1) That this meeting hereby approves, ratifies and confirms the provisional agreement for amalgamation, dated May 29, 1924, made between the Royal Institute of British Architects and the Society of Architects, and directs the Council of the Institute to carry the said agreement into effect.

(2) That this meeting hereby approves of the Draft Supplemental Charter contained in the printed document produced to the meeting, and authorises and directs the Council to take the necessary steps to obtain for such Supplemental Charter the approval of His Majesty's Privy Council.

(3) That this meeting hereby approves and adopts the new By-laws contained in the printed document produced to the meeting, and authorises and directs the Council to take the necessary steps to obtain for the new By-laws the approval of His Majesty's Privy Council ; and that the existing By-laws be rescinded immediately after such approval has been signified.

DISCOVERIES AT ST. ALBAN'S ABBEY

FOUNDATIONS OF MONASTIC BUILDINGS EXCAVATED

To the south of St. Alban's Abbey Church (now Cathedral), and overshadowed by its venerable Norman tower, an open space, commonly known as the "Abbey Orchard," slopes gently south-west towards the river Ver. This field has been for generations marked by extensive and irregular mounds, long suspected to cover the remains of the monastic buildings of the once flourishing community of Benedictine monks, and it is gratifying to see that excavations have at last been projected under the auspices of the parochial church council. Operations have already commenced in earnest near the north end of this space, and though so far they have only repeated the discoveries of some years ago (recorded on the plan in the Inventory of Historical Monuments of the county) yet what is revealed will be seen for the first time by most of those living to-day, and is of the greatest interest.

It should first, perhaps, be stressed that—independently, of course, of the abbey church—there are but two vestiges of the monastery ordinarily visible: the fine gatehouse, now part of St. Alban's School (Fig. 1), and the inner or north wall of the north cloister, built into the eastern part of the south nave wall of the church. This cloister walk, being open to the south, was warmed by the sun, and was therefore probably occupied, as at Westminster and elsewhere, by the monastic manuscripts and carrels or study-cubicles, and for the same reason this extant inner wall was decorated by blank tracery, which is of late Geometrical type. It is to be noted with much regret, in passing, that Lord Grimthorpe's modern attached buttresses, supporting the aisle wall and vaulting, bear no relation to the spacing of the bays of this arcade and have rudely cut into it—a clumsy piece of restoration which could, perhaps, be partially effaced by re-erecting the lower parts of the buttresses to spring free from the wall on to detached footings, completing the design behind where previously interrupted, as unobtrusively as possible, but without risking confusion with original work, and utilising any ancient fragments that can be reclaimed tween these mutiliated arches are shafts ing originally the vaulting of this wa which only the springers over these remain, the rest having disappeared wi open arcade which supported it on the and looked into the garth.

Immediately south of the nave is n place of this cloister and extending f westward, a strip of greensward some wide (concealing the remains of the parlour" once revealed near the west the cathedral), bordered again by a path running N.W. and S.E. (not ye turbed), divided from the "orchard which the excavations are being made railing bisecting the area of the gar which therefore only the southern half accessible.

All that is left of the uncovered portio any rate, is mere foundations, with occ ally a few courses of masonry—chiefly north-east and south-west corners (Figs of the cloister (the former delineated earlier excavation)—above the original ment level, which is several feet belo present surface of the ground. Above level and some distance below it the re appear to be of rough rubble, but beneat Roman tiles (visible in the west walk) in hundreds from the site of Verulamium thickly bedded as a firm substructure. plan already referred to assigns the cloister to the same period as the north ter and part of church adjoining, viz. early fourteenth century, for which tracery remaining is of a retrogressive the east and south walks, however, attributed to later in that century, as fragment at the north-east corner referre There is, therefore, some analogy to the ters at Westminster, of which part of the walk is of the former and the south and of the latter period. The earth, gravel, rubbish which have so long concealed ruins were evidently heaped in haphaz after the demolition of the buildings.

The excavations begin, then, with the cloister (Figs. 2, 3), and show substa foundations of its western wall, which ru ranges N.N.E. and S.S.W., but is very gular in outline, possibly indicating stopp in the work from time to time, and at abou middle of its original length is interrupte a threshold with the beds of what were a ently three shafts, two flanking and one tral, dividing it into a double opening—p ably a narrow doorway to the "cellarium wine cellars and buttery (bottlery), and haps rooms for their custodian. The ab lodging probably stood farther west, and guest-house (of which remains were once found) adjoined the gate-house. Ea and parallel with the cloister wall was arcade fronting the garth, marked by substructures of the great buttresses w took the thrust of the cloister vaulting.

The exposed sleeper walls of both ar and inner wall continue southwards for s bays and then turn eastwards, having excavated to date as far as the path lea from the south transept of the church so westward, but doubtless continuing u ground, the wall extending to the des garden wall (to join the east cloister whose site the latter approximately ma and the arcade stopping some yards befo join the corresponding range of open The arcade piers (Fig. 4), with their ma buttress substructures, resemble those on west walk, but the inner wall to the s (Fig. 5) has been even more thoroug effaced, with small fragments remainin the east and larger but intermittent bloc the west, the latter of about the same thick as those of the west walk.

Some yards south, part of a further parallel wall has been unearthed, prob forming the south wall of the refectory, suming its position here, as almost invari south of the cloister, opposite the ch This wall might well be earlier in date the cloister, and perhaps dates from the

foundation. An unusual feature is the end of a long rectangular and project- ubstructure which may have formed the of the abbot's dais (unlikely, as this was ly at the east end and could be formed hbering only), or a support for projecting ing enclosing seats of abbot and prior, ore probably—a base for a reading-desk ascending steps, as at Chester. Excava- farther east, beyond the present path, enlighten us on this and many other which are as yet obscure. It is be- that a smaller court adjoined the refec- on the south, perhaps a kitchen yard for ation of those concerned in domestic s. and that the kitchen stood, as com- . at the western end.

s pleasant to record that the organisers se to extend operations southward, over rea which apparently has never been ex- d since the destruction and burial in 'eformation period and after of the val structures. St. Albans is, there- probably on the threshold of unique eries of her buried past, and it will afford help and pleasure to many archæologists if this work of exploration is pursued to its legitimate end, and the domestic buildings of this celebrated monastery are brought to light after their uninterrupted sleep of three centuries or more.

It is understood, moreover, that a plan is on foot to remove the ground left between the trenches, reduce the ground to something like its original level, and restore the enclosure to the semblance of a cathedral close; and it is much to be desired that the foundations should be allowed to remain visible, protected if necessary from rain and snow by light roofing supported on brick piles, as adopted over St. Ethelbert's basilica at Canterbury.

Excavations have now been extended to the kitchen and other monastic buildings.

[In preparing this interim notice, with the concurrence of the Rev. Canon Glossop, M.A., promoter of the excavations, the writer acknowledges the assistance of the plan of former discoveries in the Inventory of Historical Monuments, Hertfordshire.]

DECORATION OF VESTIBULE, OXFORD-ST.

An exceptionally interesting open competition was held last autumn, when nearly 800 designs were submitted for the decoration in colour for the octagonal vestibule on the first floor of Messrs. Thomas Parsons & Son's premises in Oxford-street. The promoters offered prizes of the aggregate value of 225 guineas. The awards were made by a committee of assessors, whose distinctions added greatly to the importance of the occasion, viz., Sir Edwin Lutyens, R.A., Mr. Frank Brangwyn, R.A., Sir John Lavery, R.A., Sir David Murray, R.A., and Mr. E. Guy Dawber, F.S.A.

Only eight schemes were shown to the public and these selected proposals were reviewed in *The Builder* for November 9. The chosen design, by Mr. E. A. Cox, carried off the first premium of 100 guineas. A reproduction of his drawing will be found in our issue for November 16 last.

In careful accordance with his adopted scheme this colour decoration in paint is now completed and open to inspection. The original details for the major part have been faithfully adhered to. The result, however, certainly justifies our conclusions impartially stated when we criticised the award, and the series of patterns exhibited. The choice was not exactly unanimous, being arrived at by a majority vote. We fully realised the difficulty which arose inherently from the over elaborated character of the apartment to be decorated, including a domed ceiling over an octagonal diversified plan set off by restless architectural features. A dignified solution seemed almost impossible.

The project appeared primarily intended to display the extraordinary variety obtainable by the use of extremely fine pigments almost endlessly available, as well as the work of artificers accustomed to their application. In so far as the finish and unquestioned merit of Messrs. Parsons' materials and workmanlike application are concerned the work speaks for itself. The glossiness and brilliance of the mural surfaces may justly be described as perfect. Seemingly so perfect as to "tempt Providence" because the least scratch might mar the splendid surfaces thus brought to a polish by repeated rubbings down after the fashion of the famous coach builders' triumphs of the past. Mat finish of the Wm. Morris' day mode has given place to sheen in these times.

The assessors, for reasons best known to themselves, ignored the value of subordinating the overplus of structural features, by giving preference to partial colouring instead of adopting, as they well might have done, a more consistent homogeneous breadth of handling, if not a precise monochromatic treatment, by which this overwrought vestibule might be sobered down and moderated. The Baroque frolicsomeness introduced by Mr. Cox found favour as now realised in the pendentive positions, where the cartouches look so greatly out of scale both in form and idea, to say nothing of the ribbons which sprawl into twisted evolutions along the narrow space over the main elliptical archways. Their incongruity is emphasised by the clouds encircling the cupola below the base of the culminating radial pattern which completes the dome, pierced at its apex by a pine-apple-shaped pendant electric light drop on which the illumination of the vestibule always must depend. We note that the salmon ribs rising over the alizaris red pilasters are wisely left plain without their pale chrome enrichments originally contemplated. The spandrils over the jet black top surroundings and doors are treated like the rich recesses with pale bronze paint which in time necessarily must tarnish. The slab floor of these niches is finished in the same metallic tint brought to a feather edge in front, thus giving a thin effect in juxtaposition with the broad vermilion scarlet frontis work below. The green discs flanking the black overdoors are properly omitted from the competition design, and also we gladly remarked that the yellow picking out of the panel mouldings below the niches was given up too. The picture in the recess facing the staircase has yet to be added, and might be spared. The painted black wooden floor already shows the effects of constant traffic, a result which is inevitable.

ILLUSTRATIONS

"Ivoris," Cowfold, Sussex.

This illustration is from this year's R.A. Exhibition. Messrs. W. H. Brierley, F.R.I.B.A., and J. H. Rutherford are the architects.

Greenwich Baths.

This drawing, No. 1,228, exhibited at the Royal Academy, is the main frontage to Trafalgar-road of the design submitted by Messrs. Horace Field and H. Dighton Pearson in the recent open competition for new public baths at Greenwich, and was placed second by the assessor, Mr. H. V. Ashley. This was a particularly interesting competition, and the site lent itself to an architectural treatment of the lay-out not usually associated with technical buildings of this kind, and what added to the importance of the elevations and grouping of the buildings was the proximity of Christopher Wren's Greenwich Hospital. The entrance to the baths was from a central court formed by projecting the swimming baths on both sides and connecting these two wings by an open screen. The plans and other drawings of this design were illustrated in *The Builder* of October 12, 1923.

Church at Gorton.

This building is in its initial stage, and no building work has yet been commenced. The architect is Mr. Walter Tapper, F.R.I.B.A. Our illustration is from this year's R.A. Exhibition.

Wallasey Town Hall Staircase.

This illustration represents the principal staircase landing of the Town Hall, Wallasey, which was commenced in 1914 and completed at the termination of the war.

The treads and risers are of white marble with cast-iron balustrade and bronze handrails. The walls are treated in cream-coloured stucco plaster. The ceiling is of fibrous plaster decorated in two shades of cream. The woodwork throughout is of fumed oak. The floors of the halls and landings are of white marble and Hopton wood stone margins, with fillings of mereuil marble.

Messrs. Wm. Moss & Sons were the general contractors.

Messrs. John Stubbs & Sons executed the marble work; Messrs. W. Macfarlane & Co. the cast-iron work; and Messrs. John Tar Sons the fibrous plaster and stucco.

Messrs. Briggs & Thorneley, F.R.I.B. the architects.

Stafford Library.

This illustration shows the principal en of the Free Public Library, Stafford, whi completed in 1914.

The materials used were: Ancaster column supports of Darley Dale; and the work built with 2¼ in. sand-faced rubbed with white putty joints. Messrs. Bri Thorneley, F.R.I.B.A., are the architects

ROYAL INSTITUTE BRITISH ARCHITECT

The Annual Conference of the R.I.B.A take place at Oxford on July 9–12, invitation of the Berks, Bucks and Architectural Association. The followin gramme has been arranged:—

Wednesday, July 9.—Reception by the Chancellor of the University of Oxford.

Thursday, July 10.—10.30 a.m., welcome by the Vice-Chancellor; and Warren, F.S.A., will deliver a lecture, "An Historical Sketch of Oxford." luncheon. 2.30 p.m., visits to Universit College Buildings. 5.45 p.m., lecture b Raymond Unwin, on "Town Planning City like Oxford." 8.30–11 p.m., recept Magdalen College.

Friday, July 11.—9.30 a.m. to 6 p.m., of the vicinity.

Saturday, July 12.—Excursions and vi

At a Business Meeting of the Royal Ins of British Architects, held at No. 9, Co street, W. 1, on Monday last, the foll new members were elected:—

As FELLOWS.

T. T. Cumming, Reading.
J. P. D. Grant, Cardiff.
A. B. Knapp-Fisher, Westminster.
H. Langman, Southport.
S. D. Meadows, Singapore.
H. I. Merriman, Golder's Green.
G. A. Mitchell, Ealing.
F. A. Richards, minster.
A. W. Sheppard, Hill.
A. Symon, bury.
A. K. Tasker, castle-on-Tyn
F. E. Williams, sington.

ESTMINSTER ABBEY RE-EXAMINED—IV

By W. R. LETHABY.

THE CHAPTER HOUSE.

IS noble building is necessarily considered annex of the great church, but it deserves separate study.

e Chapter House can be securely dated as about 1250. From the fabric rolls it is that it must have been begun with the st work in 1245, and Matthew Paris ions it under the year 1250 as the incomble Chapter House. In 1253 canvas was hased as a temporary filling for the windows, iew, we may suppose, of some immediate eing made of the building.

ie source for the octagonal type of plan, ir as is known, is the circular Chapter se vaulted in ten bays to a central pillar, at Worcester in the first half of the th century. A transition between the e and the octagon is represented by the ter Houses of twelve sides at Margam Dore, one formerly at Evesham, and that incoln; the last two had ten sides. Those Beverley and Westminster are the earliest rn which reached the octagonal type: the er was probably begun about 1230.

e will preface our examination of the building by condensing some descriptions of it en before the great restoration of 1866. first is by John Carter (1799); I call attention to some passages by putting them in italic.

"The entrance is from the Cloister through a double archway; the work [here] is profuse and beautiful. How is our just indignation raised at beholding the ravages of those savage hands which have destroyed *the statue of the Virgin* which stood on a bracket in the centre, and nearly so the accompanying angels. . . . We proceed along a double avenue; a flight of steps brings us to the double archway entering the Chapter House itself. *This double archway has had its dividing column in the centre with nearly all its open tracery (in the manner of the Chapter Houses at Wells and Southwell) cut away.* We are now within, and find that five, of the eight, sides which were nearly open in one large window have had *their tracery* filled in with brickwork and small modern windows. The tracery in two of the remaining sides has been cut away; the groins, destroyed to a small portion which is yet springing from the delicate and delightful cluster of columns at the centre, arched to the several angles of the structure, *where a few portions of their mouldings may be observed.* In all probability the stalls and decorations against the lower part of the walls may be remaining but the presses block them up from the view of those few who may visit this once celebrated place. Here observers will find little but modern carpenter's work, vast rolls of parchment, dust and rubbish, and the famous Domesday Book. Among the reflections that occur is one for the danger that attends *the cluster of columns* in the centre by the modern false floor whose centrical part rests on *the remnant of the groins* springing from it."—(*Gentleman's Magazine*, 1799.) In his Specimens of Architecture and Sculpture Carter gave a plate of the outer doorway with a valuable account of it in which the small sculptured figures of the archivolt were identified as the Ancestors of the Virgin.

The next account is that given by Neale and Brayley (1823):—

"The present battlements are of brick with a stone coping. A small doorway, for official convenience [!] has been made through the wall adjoining Poets' Corner. [The filling of this may be seen in the north bay of the interior.] The great pointed arch across the [inner main] entrance is sculptured and *the capitals display beautiful foliage.* The walls are surrounded by trefoil arches; on the east side the wall behind is *beautifully gilt and painted* with a series of Angels who appear to be receiving the Faithful and rewarding them with crowns of glory; the wings of the Angels are partly expanded, and the feathers are inscribed in black letter. The original pavement appears to consist of *figured tiles* wrought with lions, foliage, and other subjects."

About this time the valuable drawing of these paintings in the eastern bays which is now placed near them was made, apparently by John Carter.

In 1842 Henry Cole (later Sir H.) wrote a popular guide to the Abbey, in which the Chapter House is again described: "The sculptures of the mouldings of the entrance arches will be found more perfect than those outside [in the Cloister], and *when cleaned of whitewash may possibly appear in all their original crispness and bright colour.* . . . Enormous windows: if we may judge from *a window now closed up*, their [lower] circles were quatrefoiled surmounting trefoiled arches. The ancient groins branch from *the exquisite capital* of the columns of the light shafts which has been suffered to remain. The floor was paved with tiles, heraldic and otherwise; portions are shown. Pillars on a stone basement support [wall] arcades. Sculptures above in *the capitals have been hewn away.* Behind the pillars all the walls seem to have been adorned with paintings executed on the stone. Enough in the paintings on the walls, *the colours and gilding of the arcades and the mural ornaments [diapers] above them*, exists to furnish authority for colours in Gothic architecture."

At this time the sculptured Angel had been removed from its niche and was standing in the vestibule. The author says of the destruction of the vault: "In 1703 when it was proposed to make a gallery, Sir C. Wren absolutely refused." The old groined roof was standing as late as 1740. It was then reported by Thos. Ripley, Wm. Kent [the chief architects of the time], and Wm. Gill to be so bad that it was necessary to take it down. "We have viewed the walls and buttresses and find them in a very ruinous condition. But the necessary repairs cannot be made to the buttresses without taking off the decayed roof" (October 4, 1744).

In *Gleanings* (1863) Sir Gilbert Scott gave an account of his examination of the building which was to lead up to the "restoration." As this is so well known I shall only make use of special points as we get further on.

In 1866, on the eve of the "restoration," it was also described in the *Ecclesiologist* by a writer who must, I think, from internal evidence, have been William Burges: "For loveliness there was probably no more conspicuous building in the kingdom when it was in its glory. What remains is so excellent—though, alas, sadly dilapidated—that we dread any attempt at restoration lest damage should be done to its precious fragments. The Chapter House which most resembles it is that at Salisbury, which was, in fact, to a great extent copied from it. . . . At Westminster we have tracery of a high order. These were *as fine specimens of*

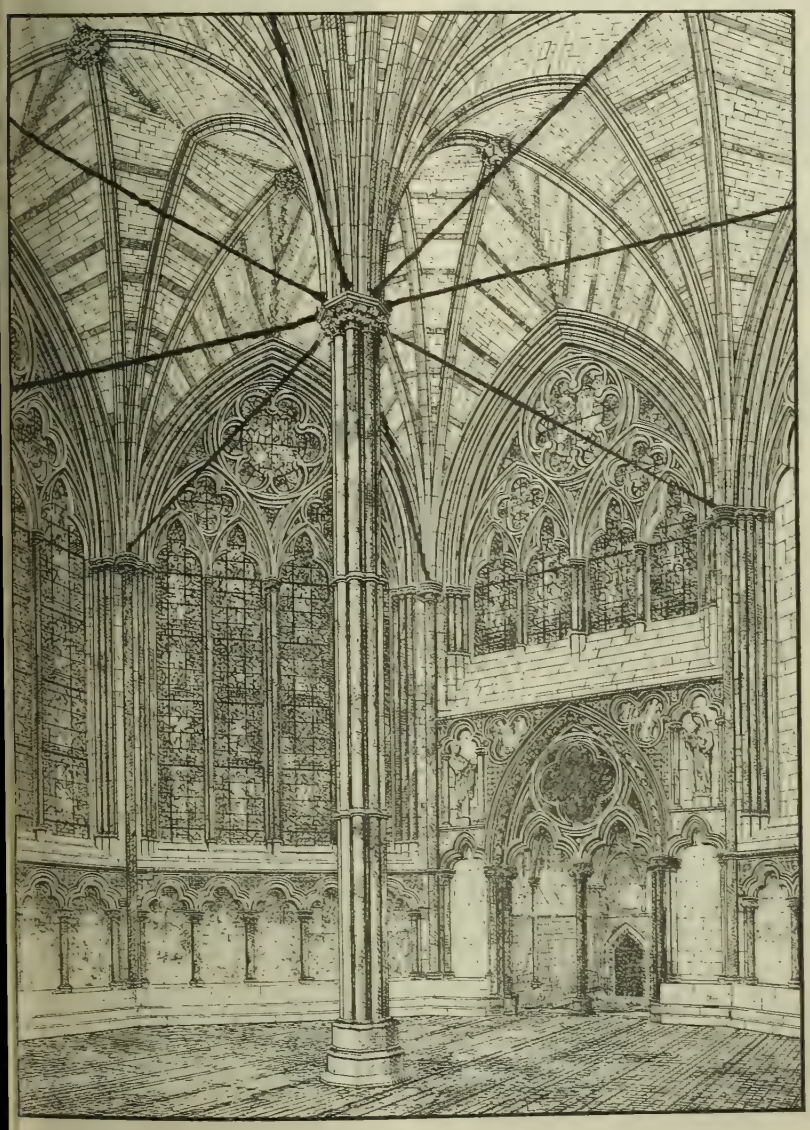

FIG. 1. DRAWING BY MR. S. WEATHERLEY, SLIGHTLY ALTERED.

four-light windows as are to be found in any country. Over the portal the shortened window was of five lights, as may be seen from the sill which still remains. . . . Nothing can well be more shameful—every window blocked up; the whole of the exterior so entirely defaced as scarcely to leave a vestige of its glory. Fortunately, *there is just enough to show that the exterior mouldings and ornaments* [of the windows] *were similar to the interior*, and so the task of restoring will be an easy matter. The interior has suffered less. The Government have simply let it go to decay. . . . A contemporary has actually recommended that nothing should be done but put the place in good repair [!]. It is urged that this fragment of art will serve the purpose of education better as it is than if placed beside twice its bulk of modern imitation. Though there is much good sense in all this, yet in the present instance [!] we cannot agree with it. . . . It is by no means impossible that *some of the old work built up in the windows, &c., may be used again*. . . . Any attempt to make a smart new building will be worse than leaving the place alone, and the greatest possible care must be exercised in retaining every bit that exists. On no account must anything be done to the wall paintings except with a view to their *preservation*. It is to be hoped that there will be no hurry in deciding the execution of the stained glass; the state of this manufacture—for at present it is no more—is not such as to warrant haste. As there is *so much valuable wall-painting* there can scarcely be a doubt that much of this *glass should be grisaille* so as not to exclude the light."

A useful record of the unrestored interior is given by a woodcut from one of the illustrated papers (May, 1866), which stands in the Chapter House. A smaller woodcut is given in *Gleanings*, and Mr. Stacy Marks made a large water-colour drawing.

Vault and Windows.—The slender central column is now a copy of that which remained until our own day, together with a part of the central springer of the vault. "The central pillar," Scott said in 1863, "*still exists* and is about thirty-five feet high. It is entirely of Purbeck marble and consists of a central shaft surrounded by eight subordinate shafts attached to it by three [two] moulded bands. The capital, though of marble, is most richly carved. On the top of the capital is *a systematically constructed set of eight hooks of iron* for as many cross-ties. The same was the case at Salisbury, and I have no doubt that the hooks on the columns in the church are many of them original and were intended for security during the progress of the works."

There is a measured drawing of the Chapter House made by R. J. Johnson, about 1859, and now at Westminster; it shows the central shaft 13 in. and the eight others only about 4½ in. in diameter. The whole pillar is so slender that we may wonder at the skill and daring which balanced so great a load on so slight a prop. There was certainly here a definite attempt to do the most that might be possible in playing with stonework.

The capital is probably a copy of the original; it is deeply carved with crisp foliage. Above it appear the eight hooks mentioned by Scott. Both here and in the church the hooks and tie-rods were intended to give not only "security during the progress of the works," but to the completed work as well. It was the fashion in Scott's day, as of ours, not to see a certain class of mediæval facts, and he seems to imply that the ties—eight rods of forged iron thirty feet long, which must have been very costly—were only of the nature of temporary scaffolding.

However, Scott had the hooks replaced or copied, and eight corresponding hooks may be seen in the springers of the vaults at the angles of the octagon. The whole conception of this octagonal structure depended in a large degree on the use of these tie-bars. The same system was copied at Salisbury, where the ties lasted on into the nineteenth century. That careful observer, John Carter, put it on record that more than a century ago it was proposed to remove them; and soon they were removed, it seems, for forty or fifty years after he wrote the building showed serious evidence of failure and the architects then called in explained that the buttresses were insufficient and added great lumps to them while cutting out the locked system of iron hooks from the central springer, which may now be seen in the south-west angle of the Cloister.

At Westminster Scott did not put back the iron tie-bars, but a visit to the roof above shows that he would not trust the construction without them. His engineer has hung up the vault to the iron roof.

At Salisbury there were never any external flying buttresses to the Chapter House, and, as it is obviously almost a copy of Westminster, this raises the question whether the flying buttresses here are original, and I believe that they are not. The one immediately outside Poets' Corner was built for the first time by Scott. The one next to it has a plinth of fourteenth-century form; the three others differ in their spans, and their plinths do not range with the plinth of the main building. I conclude that the Chapter House was built without flying buttresses in entire dependence upon its "chainage" of iron bars. (It may be mentioned that the flying buttresses around the Chapter House at Lincoln seem also to be additions.) Possibly, some of the hooks drew away from the springers and made additional support necessary at an early time. Besides the eight ties mentioned above, the windows are threaded by three tiers of strong iron bars, which are still wholly or largely original. One may assume that they link up at the angles and form bands right around the octagon. Scott found from the fact that the round bars were beaten square where they passed through the mullions, that the western window originally had four lights like the others. It seems to have had five lights substituted in the fourteenth century, following the fire of 1298 (Fig. 1).

Not only did the springing courses of the vaulting remain in the angles as well as at the centre, but Scott found many voussoirs of the ribs, several of which seem to have been re-used. There is thus no question as to the form of the vault.

Windows, Arcade and Floor.—It is clear from the old views that the central mullions and larger sub-arches remained in many of the windows, and probably some tracery was found other than that of the blank bay, which was in a large degree intact. Drawings by R. Johnson, made about 1859, now in the Abb Collection, show the windows and vault pr tically as restored by Scott; and there fortunately, no doubt as to the form details of the noble four light windows. This all the more important as they seem to ha been the source for the "geometrical" trace which spread over England. Themsel

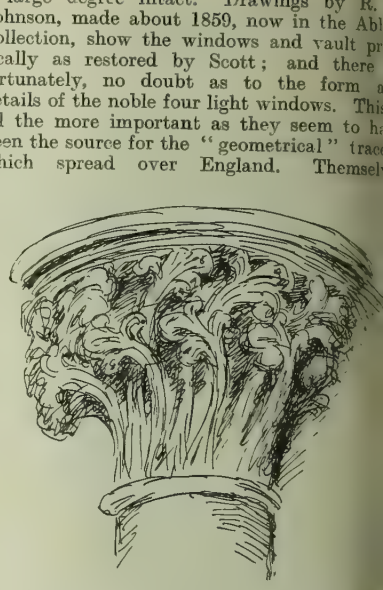

FIG. 2.

derived from Amiens or the Sainte Chapel they were copied and adapted in the Chapt House and Cloister at Salisbury, the east windo at St. Albans, the side windows at Lincoln, a those in the transepts of St. Mary's, York also at Netley, Bakewell, Grantham, and oth places. Altogether, Westminster was a gre milestone in the progress of English buildin It is more than a mere truism to say that eve other church in England was either earlier later than Westminster.

The scale of the windows is greater tha might be supposed; they are about 19½ ft. wi and 39 ft. high, the lights being 4¼ ft. wi and the large central circle 10 ft. in diamete A pretty minor detail may be observed in th two quatrefoils of each window; the upp moulding conforms to the shape of the pointe

FIG. 3. ABOUT HALF-SIZE. DRAWN BY J. C. BARTHOLOMEW.

aining arch, and only the "daylight" e is rounded.
e wall arcade above the stone benches ounding the walls is largely restored, but is hardly anything conjectural except the ed heads, &c., above the end arches in each That there were such carvings is shown one almost shapeless little body which ins. Not only the heads, but parts of the es and in most cases the fronts of the als had been cut away. The marble capitals ne eastern recesses are all sculptured, and have long bonding attachments to the wall, h are also carved. Scott, describing these ern recesses, said, "Their capitals carved in beck marble are of exquisite beauty" . 2). They have, however, been "re- ed" with a heavy hand. In the Gardner ection was a set of sketches of these capitals the attachments at the back, which prove they were badly broken, and the existing shows that large parts have been skilfully ed on. They are, however, original in a ndary degree, and the sides of the bond- es are largely untouched. One of these, ed with dragons, is of high beauty, and unately it is guaranteed by one of the ches just mentioned. Capitals carved in beck marble are very scarce. Some at South sington, which came from Chertsey Abbey, ely resemble them, especially one with gons. As will be seen later I think that these came from a work of Henry the Third. lost of the other capitals of the wall-arcade e been more largely renewed, but usually full evidence as to their ancient forms. y had puzzled me until the late Mr. S. itherley, who had been Scott's assistant, ited out to me that only an inch or so of inner part of most of them was really old, that the rest had been spliced on with

FIG. 4.

t accuracy. Mr. Weatherley gave me a t of profiles that had been made in 1866 the remaining parts by the clerk of works, Kaberry—"a more careful level-headed kshireman I never met." Mr. Weatherley wrote that "the detailing and superin- ence" of the work was confided to the ger Gilbert Scott by Sir Gilbert. The was executed by Poole & Son, the Abbey ons.
here is a carved capital on the left of the h side of the octagon which seems entirely nal, and there are some others—mostly the angles — which look old. The d heads of the wall arcade are halves of refoils, and a similar arcade is found at west end of Amiens Cathedral; the square ering in the spandrels certainly was bor- d from Amiens. The large trefoils over entrance doorway seem to have been ited from those above the western rose at ens (Fig. 1). These correspondences make it probable that the source for the four-light ows of the Chapter House was the same edral from which we shall find many other owings, rather than the Ste. Chapelle. The als and the carved spandrels over the es furnish a striking instance of the old natural delight in variation. The spandrels are of great beauty, several containing varieties of rose patterns. One, by the central eastern arch, has branches of roses on a trellis; it almost looks as if it had suggested Morris's

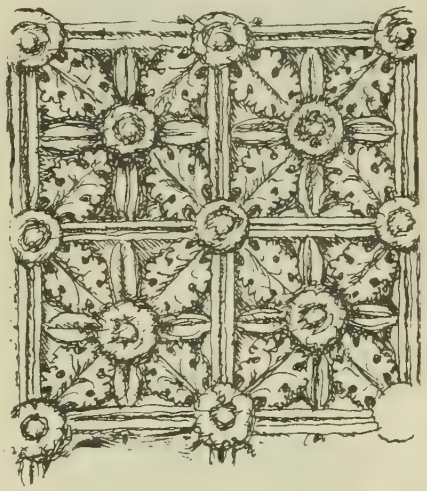

FIG. 5.

trellis pattern wall-paper (Fig. 3). Others at the north-east corner have repeated groups of five roses and there are other varieties (Figs. 4 and 5). A trail of roses is carved on the jamb of the entrance.

It was observed before that rose decoration was much used in the church, and roses were certainly in the minds of the builders of the Chapter House, as we shall see from an inscription. There was a cult of roses at this time, and rose decoration is found on the west front of Amiens Cathedral. Even at the end of the fourteenth century, when the panels formed by the wall arcade were painted, a margin at the beginning had a big rose pattern which can now hardly be traced.

The tiled floor laid down about 1255 is the finest existing pavement of the kind. There are six short inscriptions on the pavement, but they are so worn that little has been done in reading them. The best, indeed the only attempt, is that by Mr. Clayton (*Archæological Journal*, 1912). Four single lines are in the south-east sector, and two longer lines are associated with some "picture tiles" of a hunting scene on the south side. The second of the four short lines was read by Mr. Clayton:

[*Qua ?*] *Rex Henricus Sce Trinitatis Amicus.*

The floor has recently been well cleaned, and that has allowed me to read enough of the first line to make out its meaning (Fig. 6). This first inscription is given by Mr. Clayton thus:—

..SPOS.F..SI...SI.D..C.....O..U+

(The U at the end represents a contraction mark.) Re-examining it in a good light I thought the first letters were rather . . TROSAF. At the end are letters which seemed to be OMO followed by the contraction mark, which I will represent by 4, and the same mark occurs near the middle. Fig. 6 gives the beginning and end of this inscription something as it appears.

The well-known inscription written up in the Chapter House at York likening it to a rose now suggested itself.

In a guide book the York inscription is given thus:—*Ut rosa flos florum sic est domus ista domorum.* On returning to verify I find that there is no doubt as to the first five words or of the final word, and four places in front of that is a narrow space suitable for I, so *ista domorum* is also sure. I now give my reading of the Chapter House inscription, the cross at the beginning being repeated from that at the end, and 4 being used as a contraction mark for *rum*.

+ . T ROSAF . . SFLO4 SIC . . . . . ISTA DOMO4 +

It is now evident that the saying told to every visitor of the York Chapter House was made for Henry III to inscribe on the floor of the Chapter House at Westminster, and that it was only borrowed at York.

This, then, was the King's own claim, that his new Chapter House surpassed others as the rose surpasses other flowers. Matthew Paris, in calling it the "incomparable Chapter House," held the same view—possibly, indeed, he wrote the inscription.

The cleaning of the tiles makes it possible to confirm the general accuracy of Mr. Clayton's reading of the second verse—

. . A [?] REX HENRICS . . T . I . . T . TISAMI.

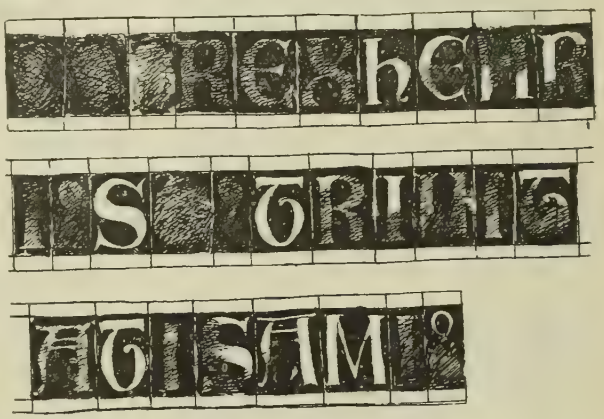

FIG. 7. ALL IN ONE LINE.

The word Trinitatis can now be read with certainty. At the end is another variety of contraction mark which I will represent by 2, and the same occurred, I think, in another place also.

. . . REX HENRI2 SCE TRINITATIS AMI2

It would probably have had a cross at the beginning, which would allow room for only a word of two letters before Rex. I give in Fig. 7 a sketch of this interesting and, one might have thought, important inscription.

The third of the verses is given by Mr. Clayton as below, and he pointed out that the last word must be *amavit*.

. RP . . . . B . . . T . V . . E .
TE . . . . MAVIT

The beginning I have no doubt is + XPō (Fig. 8). The mosaic floor of the Presbytery has an inscrip-

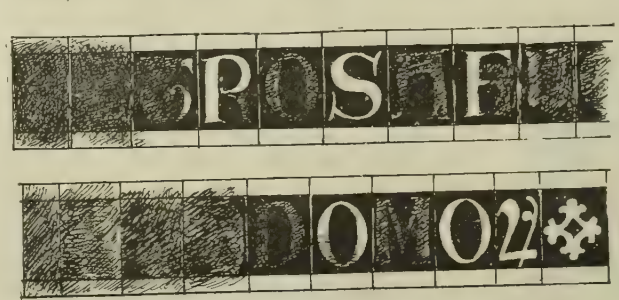

FIG. 6. BEGINNING AND END OF LINE ONLY.

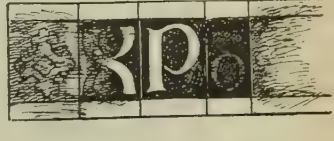

FIG. 8. BEGINNING ONLY.

tion beginning +XPI. All the letters cannot be filled in, but I think the following may be trusted :—

+XPŌ . . . . AVIT QVI SA . TE . I . AMAVIT

No word has yet been read of the fourth line, but the general meaning of the whole is pretty clear and it could now probably be read by an expert: "This Chapter House as superior to others as the rose is among flowers: it King Henry friend of the Holy Trinity: to Christ dedicated who him loved." . . .

The other two inscriptions are in longer lines and seem to have referred to the hunting scene with which they were associated. The first began HIC RESONAN[T].

The tiles seem to be by the same craftsmen who executed a very remarkable floor once at Chertsey Abbey, where the tiles contained scenes from the "Romance of Tristram." which are of particular interest in furnishing a check on the early text of that romance. At the Chapter House, besides small figures of a King, Queen and Abbot, one tile has figures of the Confessor and the pilgrim, another two musicians, and three others contain a hunting scene—a horseman and dog, a bowman, and a stag. These were called "painted tiles," and they must have been drawn by one of the ablest painters of the time. They were probably executed at Chertsey, where kilns have recently been found. Our kings had a special interest in the story of Tristram, and the version of the poet Thomas was, it is thought, written at the Court of Henry II. The pointless sword carried at the Coronations was said to have been the sword of Tristram. Now Chertsey is close to Windsor, and the Tristram floor at that Abbey must, I think, have been a gift of Henry III. The tiles seem to have paved the floor of a chapel which lay along the side of the choir aisle—a position in which a Lady Chapel is often found. From this chapel come the beautiful capitals carved in Purbeck marble mentioned above. I reach the conclusion that this chapel at Chertsey with the Tristram tiles and marble capitals was built by Henry III, and this finds confirmation in the fact that in the wardrobe account of his son an item records the gift of a cross to the King's Chapel at Chertsey Abbey.

The picture tiles in both places are so alike that I think they must have been designed by the same artist. The ornament is also very similar, and there are one or two tiles at Westminster (not in the Chapter House) which are identical with others at Chertsey. The inscriptions at Chertsey are also very similar in style to those at Westminster; some are on separate blocks, others are in longer strips, and of one of these I give a sketch (Fig. 9). The style of all

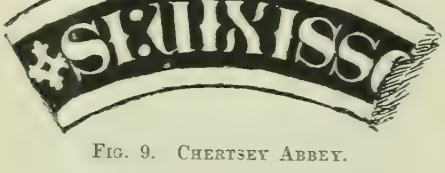

FIG. 9. CHERTSEY ABBEY.

is very like that practised at St. Albans in the middle of the thirteenth century. Apart from the figures, a type of foliage occurs with a long waving pointed leaf and cross bars on the stalks

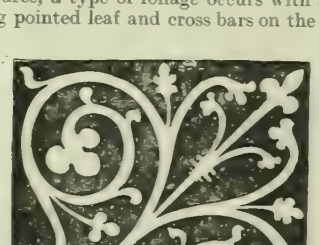

FIG. 10.

(Fig. 10), which I have only found on a beautiful St. Albans drawing at the British Museum (2 B, VI), and in North French MS. The same

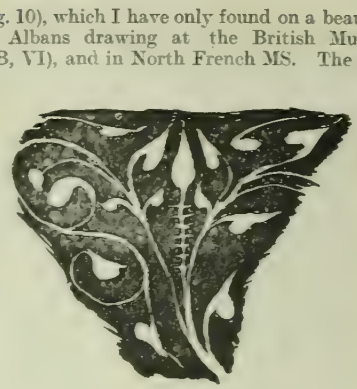

FIG. 11.

artist who did the drawing may have designed the tiles. Fig. 11 is from the Saint Albans drawing; Fig. 12 is from one of the smaller tiles,

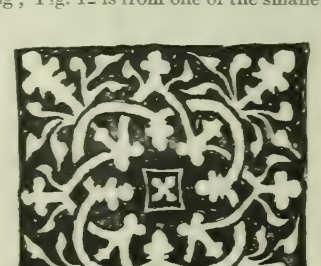

FIG. 12.

which, I think, has never been illustrated. The kind of leafage just mentioned is most marked on some border tiles.

[CORRECTION.—In part III for "accessors" read assessors.]

BOOK REVIEWS

The Styles of Ornament. By ALEXANDER SPELTZ. Translated by R. PHENE SPIERS. New edition. (London: B. T. Batsford.) 20s.

MANY objects derive their principal effect directly from their own form and structure; the embellishment is of the very essence of the object itself, and has developed out of its construction and framework. Such, for example, are many of the great buildings of the past, erected in all ages and countries, and the higher form of decoration doubtless finds its expression in giving interesting emphasis and character to the outstanding features of the structure. Others, again, such as large wall or floor surfaces, depend almost entirely for their effect on the decoration applied to them. The attempt to embrace the whole range of the decorative arts in one volume, such as the above, must have been a heavy task. In a series of 400 plates are shown about 5,000 examples of almost every conceivable branch of the decorative arts, both plastic and applied, and illustrative of objects of all periods, from prehistoric times to the present day. These include almost every form of decoration, from that adopted for the embellishment of temples to that applied to household furniture, wearing apparel and illuminated manuscript. Most of the figures are well drawn and all are taken from actual objects of the period and character illustrated. The wealth of useful material collected here in a convenient and comparatively small compass is of great value for purposes of reference. That such compression has been attained in some cases at great sacrifice was but to be expected. This is particularly observable in cases, such as large wall surfaces and pavements, in which the decorative effect is entirely dependent on the scheme as a whole, fragments represented on plate 49, for exa can convey only a faint idea of the effect of Pompeian mural decoration. The is divided into three main sections, Antiquity, the Middle Ages, and Renai and Modern Times, and each section is f sub-divided into sections under the cou of origin and styles treated. There is chapter on Prehistoric and Primitive Orna Decoration is thus traced from its oldest of geometrical figures, composed of bands, and straight and curved lines, employment, on the advance of intellectu technical skill, of the forms of plant animals; and, finally, the human figure. deduction that ornament should be in con subjection to the form of the object embel and to the nature of the material of whic object is composed is unquestionable. A bibliography is appended.

Pattern Design. By LEWIS F. DAY. (Lo B. T. Batsford, Ltd.). 10s. 6d.

Pattern design, defined here as orname ornament in repetition, is seen unde guidance of this able and practical wri develop from a single unit in so simpl natural a manner that we wonder wh principles of this development are so violated. It is much to be desired tha book should be in the hands—and its m grasped—by all designers of marble, t mosaic floors, of wall papers, carpets, or, in of all surface decoration. We should th spared much that offends the eye and additional pain at times when prolonged on such surfaces is rather a matter of nec than of choice. The main lines upon repeated ornament is built are so few simple that they can be easily traced and generally be reduced to the square, the tria the octagon, or the circle. The author has siderable reason for his belief that the elab Oriental patternwork was developed designs formed out of triangular piece marble, glass or tile, and demonstrate description and illustration how the appar most complicated designs, such as those wall surfaces of the Alhambra, may be red to a nucleus of the most simple form. principles of the drop repeat, the turn and the turn round, are lucidly dealt with there are useful chapters on colour, which sh be planned from the first, and on bor The work is copiously and well illust throughout.

Islamic Architecture. By PROF. SATTAR KH M.A. (London: John Tiranti & Price 2s. 6d.

This book contains a collection of forty- photographs selected principally from exam of Islamic architecture in Spain, North A Turkestan, Arabia and India. They repr mosques, tombs, fountains and civil and do tic buildings built during the mediæval later periods. As far as the restricted si the work permits these form a typical seri examples of Moslem architecture, are suffici large to be useful illustrations, and are cl produced. Their value, however, would greatly improved if the descriptions printed below the photographs instead of collected and placed in the front part of the The text preceding the illustrations is conce chiefly with Islamic apologetics and ther scarcely justifies the title of the work.

VERCROWDING IN THE ARCHITECTURAL AND SURVEYING PROFESSIONS

E Executive Council of the Architects' Surveyors' Assistants' Professional Union issued a report on "Education and Overding in the Professions of Architecture Surveying and the Technical Branch of Building Industry," in the course of which stated:

At the present time there are two systems rofessional training in being for the proon, namely, the pupil system and the ol system. A census which we have taken is to show that at present there are in the essions five articled men to every school . Having regard to the fact, however, the school system is barely twenty years and is increasing rapidly, the disproportion kely to rapidly diminish. It is not denied the "articles" system has in the past productive of excellent men. As a system as probably fitted for its time; this time, ever. has passed away.

To-day in the big town offices the prinl's time is much too valuable to devote sonally to the training of pupils. It is rettable, however, that in many offices in incial towns pupils are still taken, but left ely to their own resources. In the smaller incial towns pupils are still generally en where they can be found, but here also pupil is at a disadvantage. He is taken the office not because the principal feels articular aptitude for training another man his profession, though he himself may be apable architect or surveyor, but because practice is not sufficiently remunerative hout the constant succession of premiums. such an office, unfortunately, the pupil is ng little more than learning to trace and s letters. The general opinion of members his Union is that much of the time they nt in their articles was wasted; what they nt they claim to have learnt afterwards in r offices, at evening classes, and by private y.

There is, however, a greater evil in this tinued succession of pupils. It is the mass duction of young architects and surveyors, ly equipped, at a rate quite incommensurate the world's use for them. We have obied certain statistics and give these mples:—

(A.) A large town in south-west England at present 22 architects and surveyors ened as principals, 15 paid assistants, and premium-paying pupils.

(B.) A town in Scotland has 7 firms of itects and surveyors, 8 assistants, and apprentices.

(C.) A large industrial town in Wales: irms, 5 assistants, 12 pupils.

(D.) A town in Lancashire: 2 principals, ssistant, 2 pupils.

(E.) A town in North Wales: 2 prinls, 1 assistant, 3 pupils.

A report with reference to the Aberdeen calls attention to the schools as a source vercrowding equally with the apprenticeship em, and we are of opinion this should ive the serious attention of the respective itutions for our professions. We are of ion that the professional institutions should eavour to obtain a greater control over the ols run by local education authorities than have at present, and to afford them in rn a more generous recognition.

There is in addition a large class entering profession with no definite scheme of train at all. The unarticled pupil enters an e with the idea of picking up a few ings a week as odd boy; perhaps he learns race; perhaps he attends a class in build construction or quantities or land surng in the evening school. A few make l, but the majority swell the ranks of the i-skilled and form the bulk of that subtum which is always unemployed in a "slump." We are of opinion that the whole structure of evening technical schools should be remodelled, that they should only be open to those definitely entered for a calling and intending to qualify completely for it.

"The danger to the professions and to those men lies in the fact that they are not wanted, and that the professions have no control whatever as to their entry into them. A census as to the training of architects, surveyors and their assistants showed that of 568 architects 67, or 11.8 per cent., and of 309 surveyors, 47, or about 16 per cent., had not been definitely intended and trained for their professions.

"In addition to the recommendations above, in order to obviate the present conditions of overcrowding and unsuitable training, we have come to the following further conclusions:—

"(1) That the Royal Institute of British Architects and its Allied Societies, the Society of Architects, and the Architects' and Surveyors' Assistants' Professional Union for the architectural profession, and the Surveyors' Institution, the Faculty of Surveyors (Scotland), and the Architects' and Surveyors' Assistants' Professional Union for the surveying profession, in co-operation, can even without registration almost completely control the conditions of entry into and training for their respective professions, and should form Joint Boards.

"(2) That no member of the above bodies should be allowed to employ in his office on other than purely clerical duties any person who has not been trained at a proper school for the training of his profession, or has not been articled as specified below, or has not been employed as an assistant or engaged as a principal in practice for at least three years previous to a date to be agreed.

"(3) That the ultimate end of all education must be that it is for the benefit of the student and not for that of the teacher (in the case of indentured pupils or apprentices, the employer), though each of these is undoubtedly entitled to proper remuneration for his services.

"(4) That though undoubtedly the school system is greatly superior to the 'articles' system, yet the combined cost of tuition and maintaining the student in the town where a school is situate would be prohibitive to many parents and guardians in towns where no school is within easy reach, and yet they may have sufficient connection to ensure a reasonable practice in the years to come. We are therefore of opinion that the 'articles' system should be continued in such districts, but under such conditions as will ensure an adequate training.

"(5) We therefore recommend that pupilage should not be allowed in the office of any member of the institutions situate within one hour's railway journey (during ordinary business hours of travel) of a proper school of architecture or surveying.

"(6) That no pupil or student shall be entered in any office or school unless he has obtained matriculation standard.

"(7) That, subject to a satisfactory probationary period in such a school, a student's parents or guardians should be obliged to enter into a legal contract, under penalty, to maintain the student at the school for at least three years.

"(8) That outside the areas of such schools (defined (5) above) the Joint Board for each profession should only permit pupilage in certain approved offices under strict conditions of control.

"(9) That the annual quota of new students for each school and the number of new articled pupils shall be pre-determined by the Joint Boards in accordance with the needs of the professions.

"(10) That separate approval shall be given for each articled pupil entered in an office and shall be discontinued if the results are unsatisfactory.

"(11) That pupilage shall be for not less than three years. During the first half of his term the pupil shall spend his whole time in study; during the second half of the term not less than half time; the other half to be devoted to obtaining practical experience in the office.

"(12) That the first three months shall be probationary, and the ratification of the indenture shall be subject to the approval of the Joint Board as the result of test work.

"(13) That a detailed syllabus of training to be strictly adhered to shall be issued by the Joint Board or by such other authority as may be delegated by it, and a summary of it incorporated in the indenture; that such syllabus shall cover academic and practical subjects.

"(14) That the pupil shall sit for his intermediate examination at the termination of his pupilage. Failure to pass shall necessitate a further six months or year of pupilage. If fault is felt to be with the employer a transfer may be decided by the Joint Board, and the employer not allowed to have further pupils.

"(15) That no assistant shall be employed until he has passed his intermediate examination.

"(16) That on the termination of his pupilage the student shall be recommended and aided to obtain employment, if possible, in some town where he can obtain useful experience and further professional tuition in some good evening school.

"(17) That the existing evening institutions be reorganised to this end.

"(18) That premiums shall be allowed, but that fees should be charged out of them to defray the cost of the syllabuses. No indenture under this scheme should, however, be allowed to contain restrictive clauses as to future practice.

"(19) That letters be circulated to the headmasters of all public and secondary schools, the Association of Headmasters and Headmistresses, and all local education authorities, setting forth the method of entry into the professions as approved and recognised by the Joint Board for the information of intending entrants.

"We have used the term 'proper' school in these recommendations to cover any other day school for the teaching of architecture and surveying which may be approved by the respective Boards. This would probably include a large number of the present polytechics and municipal institutes. All other schools would eventually have to close."

The Surveyors' Institution.

Sir Edwin Savill (London) has been elected President of the Institution for the coming year; and Mr. J. D. Wallis (Manchester), Mr. Dendy Watney (London), Mr. H. M. Cobb, C.B.E. (Rochester), and Mr. E. A. Rawlence (Salisbury), Vice-Presidents. The new Members of Council elected at the recent ballot were Mr. C. Chart (Croydon), Mr. W. Fraser (Glasgow), and Mr. Cuthbert Lake (London).

Cardiff Technical College.

A party of architects recently visited the Technical College, Cardiff, to inspect the work of the department of architecture and civic design. The party represented the Board of Architectural Education of the Royal Institute of British Architects and consisted of Mr. Curtis Green (Chairman of the Board and Vice-President of the R.I.B.A.), Mr. Maurice Webb (member of the Council of the R.I.B.A.), Professor Reilly, and Mr. E. J. Haynes (Secretary of the Board).

After its visit to the Technical College the Visiting Board, together with the chairman of the Technical College Committee (Councillor A. J. Howell, J.P.) and Principal Coles, were entertained to lunch by the committee of the Cardiff branch of the South Wales Institute of Architects, Mr. Percy Thomas, President of the South Wales Institute, occupying the chair.

BRITISH SOCIETY OF MASTER GLASS PAINTERS

On May 27 the Earl of Crawford and Balcarres took the chair at a joint meeting of the British Society of Master Glass-Painters and the Society of Glass Technology. Dr. Ethel Mellor, Mr. Noël Heaton, and Professor W. E. S. Turner read papers.

Dr. Ethel Mellor, in the course of her paper on "The Decay of Window Glass from the Point of View of Lichenous Growths," said lichens were a group of plants placed quite low in the vegetable kingdom.

The fragments of glass from church windows so far examined by Dr. Mellor showed a lichen flora comprising 24 species and varieties. The three most common lichens, Diploicia canescens Ach, Pertusaria leucosora Nyl, and Lepraria flava Ach, were frequently found in the smooth surfaces of glass; their débris occurred on slightly roughened surfaces corresponding to the area covered by the living plant.

Crustaceous lichens represented the greater part of the lichen flora of church windows; they were the best adapted of all lichens to an exposed substratum, as the whole of their under surface was attached to the support. The foliose lichens, so-called because of the leaf-like thallus, were present on fragments of glass. These root-like attachments of the thallus often corresponded to tiny opaque discs or beginning of pits in the glass; particles of glass were fixed to them and incorporated in them.

The inner or front surface of glass sometimes bore poor specimens of the common crustaceous lichens. The front of the glass was most frequently covered with fungal strands resembling cobwebs intermixed with colonies of algal cells. Though the conditions existing inside a church were not favourable to the building up of the fungus and alga into a lichen, these two constituents of a lichen frequently existed on the front surface of the window, and incorporation of glass particles occurred.

What effect, continued Dr. Mellor, had the lichens on their support? Water must be retained by capillarity between the lichen and the glass, and this water must become surcharged with the carbon dioxide given out by the lichen during respiration; the glass was thus subjected to increased chemical action. Lichens accelerated the corrosion of window glass in much the same way that they aided the weathering of rocks. Bachmann, a German botanist, had stated that lichens must exert a mechanical and chemical action on their substrata, and that they must give out solvent acids. The growth of lichens was favoured by a free circulation of fresh air, a certain intensity of light, and a degree of humidity; wind and the hot, direct rays of the mid-day sun were unfavourable conditions.

In conclusion, Dr. Mellor said lichen spores, soredia, and algal cells were all very minute, and found a resting place on the unaltered surface of glass. To prevent the establishment of lichens, brushing, washing or otherwise cleansing the windows was necessary.

The second point was that the leading of windows was a substratum for lichens, and also often acted as reservoirs for water surcharged with carbon dioxide evolved during the respiration of lichens growing on the glass. It had been stated by H. Gaudin that the leadings might become friable and unstable within a period of fifty years, and that more windows had been lost through this chemical change of the leadings than through the corrosion of the glass. The glass of a window might be pitted or even perforated, but it still existed, whereas the chemical change undergone by the leadings might be completed before detection, and the glass as a whole lost through the instability of its skeletal framework.

Mr. Noël Heaton, in the course of a paper on "The Decay of Mediæval Stained Glass," said they were familiar with the variation in decay, but the cause had for a long time been a subject of speculation: the moon, insects, birds, and bacteria had all been held responsible. Even as late as 1920 it had been referred to as an inexplicable mystery. His first paper, as far back as 1896, had led him to the conclusion that decay was mainly due to the composition of the glass.

Roman rolled window glass, of which the lecturer showed actual examples, was an example of the requisite composition. It was very plentiful, and although introduced about the first century A.D., was always in perfect condition. Examples of Roman sheet glass, which had been buried since the departure of the Romans, had been found in a perfect condition with the exception of a slight iridescence. This, surely, was a proof that its preservation was due to its composition.

Mediæval glass, however, which had been buried since the Reformation, was completely destroyed. In fact, in comparison with Roman, all mediæval glass was subject to excessive decay.

The Roman formula, which corresponded closely to the formula of to-day for making sound window-glass, seemed to have been lost in mediæval times. Striving for larger sheets and a lack of proper materials contributed to the decay, in mediæval times; also their kilns were very irregular in action.

With regard to the processes of decay, it seemed due to chemical decomposition through the absorption of water, and the extent seemed due to the amount of alkali in the composition in relation to silica. High silica content gave an adherent iridescent film, which gave rise to the legend that old glass threw no shadow.

Actual glass from York Minster showed well defined pits, one of them showing transparent as if something had actually fallen out. There was an example of pitting in modern glass in a piece from Ambleforth Church, painted by Hodgson, of York, in 1855, but this was quite abnormal. The cause of pitting was, probably, lack of uniformity in composition.

Enamel, being mainly of lead silicate, was a great protection to glass. From his experiments he had proved that it was possible to produce artificial decay, therefore he considered lichen was more an effect than a cause.

In conclusion, the lecturer said they could go into old churches like York Minster where the glass was decaying owing to its poor composition. It needed delicate handling, and it was a matter for regret it was not getting it. They could go into modern churches, like St. Martin's, Scarborough, where the enamel had peeled off in a few years. Both cases were due to ignorance of glass technology. That was why collaboration between the two trades was to be welcomed. If the glass itself was of the right composition, and the enamel used in painting of the right composition there was no reason why windows executed to-day should not last intact to the thirtieth century, as those glorious windows of Chartres and Bourges, Poictiers and Auxerres, Canterbury and Lincoln had come down to them to-day.

Professor W. E. S. Turner, in a paper on "The Weathering and Decay of Glass," said he was interested in glass from the point of view of physics and chemistry. He did not think that the problem of weathering in glass could be solved apart from the question of corrosion in metals.

With regard to the time factor mentioned by Mr. Heaton, the glass had been subject to artificial corrosion as soon as the glass was made, and not left for a period of 70 years. It was quite possible to reproduce in gla intensive methods decay which, under n temperatures, required centuries to about.

The prime cause of decay in glass simply water. Some of the most stab glasses, such as granite, etc., showed of absorbing water. Schott and Lene Germany, had produced various tables ing that stable glasses, corresponding to absorbed water.

SOUTH WALES SUR VEYORS' INSTITUTIO

The South Wales and Monmouthshire B of the Surveyors' Institution held its a general meeting recently at Cardiff. Mr. Davies presided.

After the election of officers for 1924 a d on "Leasehold Enfranchisement" followe

Mr. Pendlebury, in opening the debate, that the leasehold system was probably in vogue in South Wales than in any other of the country. He recited the grievanc lessees, and added that for more than a thou years land in this country had been regard private property. The proposal now made to seize upon the man now owning land deprive him of a considerable part of its v The difficulty was that there was no syste selection other than jumping upon the pr owner of certain property whilst the ve escaped with the full value paid to him. Amo the advantages of leasehold were the fact under the 99 years lease system land was systematically laid out for building than u any form of freehold in the hands of s investors; that greater harmony existed to between large landowners and local author as regard lay-out of land, &c.; that the exist of restrictive covenants as to the character use of buildings tended to amenities of a dis and prevented unsightly buildings being ere that leasehold system afforded great facil for large urban improvements at no g expense to the public when the leases fel and that it tended to check jerry-building promote building.

THE FUTURE OF SK SCRAPERS

In an interview with an American ne paper Mr. Alfred C. Bossom pointed out advisability of making provision for the tension of new tall buildings. " laws have," he points out, "restri the height of buildings in an endeav to give each building its due share light, and hence the steady trend upw has decreased. The wholesale demolishing big office buildings, while they seem to be good as new, will thus be checked. A matter of efficiency and prudence, theref skyscrapers must be so built that they from time to time renew their youth and retain their main structure. The older can be raised a little in height by add if the necessary ground can be obtained." new era has already dawned as a result these conditions, in the opinion of Bossom. "The skyscraper which is be built to-day," he said, "will be the old scraper of to-morrow. It should live to a old age. More money is now being inve in large commercial buildings than before, and the period of indiscrimin scrapping of one tall building to make for another still taller will soon be close Mr. Bossom then proceeds to dwell on necessity for so designing the building future ideas can be incorporated in it with affecting the main structure.

Institute of Patentees.

The Institute of Patentees will hold an exh tion of inventions from August 11–16, in Aldw House, Kingsway, W.C.2.

HOUSING

MR. JOHN E. YERBURY, LIC.R.I.B.A., rites:—

SIR,—I have read your leader and notes of ay 23 last with great interest, and should glad if I may comment upon one or two of e salient facts upon which you desire to cus attention. The most important fact is at no one has succeeded in constructive atesmanship although we are all quite good destructive criticism. I must leave you to dge whether what I have to say is suffiently important to justify the space required your columns.

I think you are over-sanguine when you say We know the problem will be solved some ay in the way the community has got other ings that it wants with little or no State d." What has the community got without e aid of Parliament? Factory Acts, Edu-tion, Insurance, Old Age Pensions, Housing id Town Planning, everything that is of al value to the community has been ob-ined only by the aid of the State. Of ourse, individually, employers are humane nd even charitable, but that does not answer ie question which the worker asks. Why ould I obtain only a mere miserable exist-nce which denies me all that makes life orth living, while the investor in bonus iares receives the return of his investment, nd then interest on his watered capital? It upon the answers given to such questions iat depends the increased output which alone an save the situation. It is the middle class mployee who now asks these questions much iore than the manual worker, and he will ress for an answer.

In attributing our present troubles to the ict that building was too cheap and profits f speculation cut too fine before the war, ou ignore the salient fact that working class wellings never were provided by speculators. s Major Barnes has shown, the poorer paid orker has always lived in third, fourth, or fth hand houses as he has worn second-hand othes.

Speculating builders provided small residen-al villas and sold to the occupier or investor. ut the working man cannot be a buyer; he as not the money, and cannot afford to be ained down to one locality. If in the past has been impossible to provide working-ass dwellings, is private enterprise more kely to succeed with the admitted inevitable osts added to the difficulties?

There is a chance of a decline in labour ost and a reduction in cost of houses by ther methods than reducing wages, *i.e.*, by creasing wages and obtaining the best out-ut. It is the spirit of your "Notes" on a'-canny that is required, and in the building ade of London I am sure trust would create ust.

I do not know whom you quote, "What ost people competent to express an pinion" propose that the Government should "to encourage those who had provided ouses in the past"; I fear they too over-oked the rather important fact that no one id provided in the past the particular houses e need.

The repeal of the Rent Acts at the present me would spell ruin to the professional and her middle class occupiers who do not live their own houses.

Rents would go up, but you are wrong in pposing "people are in a position to pay"; id the assumption that because everything st more people paid more (you say, "As e know they did") is wrong. Most of us ent without because we could not pay for hundred and one things we used to think sential. The repeal of the Rent Acts ould lead to property sales and increased ntals to the breaking point, but not to ttage building; thousands of middle-class milies would be driven into working-class wellings, and those for whom the dwellings ere intended would be forced into slums; but it would not produce one single workman's cottage, simply because it does not pay to build and let at rentals which can be obtained on the present wage of would-be occupiers. When "those most competent to express opinions" talk of more houses built they mean villas "to sell," not cottages "to let." You say "there can be no doubt more and more houses would have been built," and "rents would have fallen as the supply increased." What sort of houses are those? Working-class cottages? There certainly can be "doubt," in fact, it is almost a dead certainty that your statement is a fallacy. Your statement that "even now this is the best way out of the difficulty" is an alarming one; and your reason, "that the cost would be borne, not by the community as a whole, but by those who were supplied with what they wanted," takes my breath away. So our friends who gave up their homes to serve their country must pay extortionate rents, because their stay-at-home neighbours were wiser in their generation; and the profiteeer may suck the blood of the man who sacrificed his home that the community as a whole should not be asked to pay—only those who are being supplied with what they want. This is homes for heroes with a vengeance. "The best way out of the difficulty." Is it? Let us have the next best then.

In reply to Sir Ernest Benn's letter to the *Times*, it will be nearer the truth to say that if the Housing Acts had never existed we should probably have had a second great plague. I don't think Sir Ernest's letter helps very much. The Government scheme, as outlined, will probably not be successful; and, if successful, is frightfully costly; but I certainly should be surprised to find the Government prepared to repeal the Rent Acts and pay the increased rents. Surely this would be stark staring daylight madness, and would make the whole community pay exorbitant profits to those who, having bought property (while there was a panic and a consequent rush to sell) at a very low price would, without compunction, double rents all round, and convert an already extremely profitable deal into a real gold mine.

The decent property-owner, of course, would not conceive the idea, but even he would be forced in time "to do as others do."

A subsidy is the wrong method, being generally an encouragement to extravagance and unfair inflation of prices. In the Report of the Building Industry I fear the main impelling thought is for those other works which keep the industry fully employed, rather than for housing. There is a shortage of skilled labour, but stabilisation is not worth having if all building is to cost more by the creation of a huge combine of employers and employed, based on high wages and profits, and small output.

We cannot produce houses without the good will and best efforts of those engaged in building them, but the building industry as a whole in its report declares that housing is a very small portion of its activities, and seems so much more concerned for the other work than for houses that one is inclined to think a new side to the industry should be started for the provision of working-class dwellings, which might easily be done by the fuller development of concrete buildings, which would require comparatively few highly skilled men, and would pay good wages to semi-skilled and unskilled workers giving their best output.

To adopt a lower standard of output than the pre-war, or even to accept the standard of 1914 would be fatal to success. For 20 years before 1914 output in the building trade had become lower and lower as wages became higher and higher. The Census of Production Report for 1907, published in 1913, gave the output at £84 per head per person employed; one dreads to estimate what it is to-day.

The one and only way to obtain the best output is to create contented workers and to give them confidence in those who direct the industry. It is nonsense to suppose the worker is out to rob his employer, or that the employer consciously desires to enslave the worker; but the unfortunate fact remains, they both act as though this were the case, and neither seems disposed to give the other credit for any good will; mainly because the most commercially minded employers and the most revolutionary workers are more often heard than the men of peace and good will. I shall never cease to regret the scrapping of the Foster Committee's Report to the Building Trade Parliament.

It is true we cannot satisfy our needs with the present amount of skilled labour, and public opinion should be roused to force the trade unions to accept whatever dilution is necessary under proper and reasonable guarantees; but at the same time public opinion must be equally emphatic against profiteers and safeguard the community against unreasonable profits.

Unfortunately housing must be "a pawn in the great game of politics," for the simple reason that private enterprise cannot "cure the evil," and your quotation from Sir William Joynson Hicks only shows how little he knows of the subject. Once more I must repeat, working-class dwellings never have been supplied by private enterprise, and with much stronger reason cannot be supplied now, without assistance from the State.

I most cordially agree with the writer of your "Notes" on "Ca' canny" and "Increased Output." Without confidence all our efforts are vain. I enclose copy of scheme for Housing Finance, which I have put before the Minister of Health.

In my view the question must be dealt with in conjunction with rating reform and taxation of land values; and by Government loans on easy terms to public utility societies or municipalities, who would employ contractors in the usual way if prices were reasonable, and carry out the work with direct labour if contractors tried to profiteer. In the same way they would deal with merchants if fairly treated and become manufacturers and importers if not so treated.

I do not claim that my scheme is perfect as it stands, but it is cheaper and more certain than any put forward by the three Governments which have tried to solve the problem.

One other thing needs saying, that is, if the working classes are to have houses by the help of the State proper protection must be given to those who provide them against "No Rent" strikes, the number of which and the losses occasioned should be made public in order that the community may know how it is sometimes served by certain classes of its members.

Government Housing.

At a meeting of the Council of the Association of Municipal Corporations, held recently in London, the report of the Special Committee appointed to consider the Government's housing proposals was presented. The report reviewed the negotiations between the Minister of Health and local authorities. The resolutions passed at the conference on the 8th ult., set out in Mr. Wheatley's letter published on the 16th ult., were approved, subject to the following conditions: (1) That the Government proposals as to subsidy be accepted; (2) That the terms providing that the Government shall make good any loss sustained by local authorities by reason of reduction of rents of houses erected under the Acts of 1919 and 1923, as a result of the limitations of rents under the proposed legislation, be insisted upon; and (3) That the proposed revision of financial arrangements shall take place triennially during the period of the Government's proposed building programme, but this triennial revision shall not under any circumstances reduce the contribution of the Government in respect of the houses erected or in course of erection before such revision takes place.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

Housing Proposals.

The speech of the Minister of Health on the new housing proposals is given on p. 920.

Four Years' Progress.

Mr. Wheatley informed Mr. Franklin that the number of houses completed since the beginning of the scheme or under erection at the end of each year, in respect of which the annual deficit in excess of the penny rate was borne by the Exchequer was as follows :—

1920	70,335
1921	146,122
1922	166,238
1923	172,747

Brickfields Closed.

Mr. Wheatley informed Mr. W. Thorne that records were not available to enable distinction to be drawn between the numbers of bricks produced by machine-made and hand-made processes. The approximate number of brickfields producing or temporarily closed was estimated by a Committee of the Ministry of Reconstruction in January, 1918, as follows, viz. :—

England	1,135
Wales	46

The present rate of production was variously estimated at between 2,500 million and 4,000 million a year, and from a recent report by the Building Industry Committee it would appear that the full capacity had not yet been reached. The Government had had under consideration various means by which undue rises in prices of bricks might be obviated and proposals with this end in view would be made in due course.

Houses for Sale.

Mr. Mills asked the Minister of Health if he would take steps to initiate legislation that would result in the occupation of over 250,000 houses at present held for sale ; whether subsidies were in prospect to builders who intended building for sale only ; and what steps he proposed to take to deal with those builders who had houses kept for sale which had received the subsidy.

Mr. Wheatley said he was not aware of the basis of the figures given. After careful consideration he had come to the conclusion that he could not undertake to introduce legislation this session to prevent the holding of houses for sale and he could only concur with the hon. Member in regretting that not even the provision of subsidies had made it possible for the private builder generally to build houses for letting.

Tender Prices.

In reply to Mr. A. T. Davies, Mr. Wheatley said he was aware that the tender prices for houses received by local authorities had in the last few months been increasing. It was obvious that increases in cost must prejudice the efforts being made to meet the need for houses, and it was the intention of the Government to take every practicable step to prevent increase of prices.

Direct Manufacture of Building Materials.

Mr. Wheatley informed Mr. Hardie that as at present proposed it was not the intention of the Government to undertake the direct manufacture of building materials.

Conversion into Flats.

Mr. Wheatley informed Sir C. Starmer that provision was made in Section 5 (1) (c) of the Housing, &c., Act, 1923, for assistance to be given by local authorities in the case of the conversion of a house into flats. It was not the intention of the Government to extend the new subsidy proposals to this purpose.

Smoke Abatement.

Mr. Wheatley informed Mr. Lorimer that the Government hoped to introduce a Smoke Abatement Bill at an early date.

Contract Basis.

Mr. Baker asked the Minister of Health whether the veto on the granting to the building guilds of housing contracts of the form known as basic sum contracts, originally approved by his department under the late housing scheme, was still in force ; and whether local authorities were free under the present housing scheme, and would be free under that now in contemplation, to enter into contracts with the building guilds on the basic sum principle with his approval.

Mr. Wheatley said this question was under consideration and he hoped to be able to find means of enlisting the help of the building guilds, but he was unable to make a statement at the present time. He might say generally that he thought it was very desirable that contracts should be on a lump sum basis.

Public Utility Societies.

Replying to Lieut.-Colonel Fremantle, who asked whether he would include practical proposals in the new Housing Bill for the encouragement of public utility societies, Mr. Wheatley said he would give the fullest consideration to the suggestion.

Land Registration.

Sir P. Hastings, Attorney-General, informed Mr. Linfield that the Government would be prepared to make orders establishing compulsory registration of title to land in any county or counties where application was made for such an Order by the County Council concerned in accordance with the provisions of the Land Transfer Act, 1897.

Miniature Lighthouses.

Sir W. Davison asked the First Commissioner of Works, whether the design of the miniature lighthouses with blinking green eyes, which had recently been erected in front of Buckingham Palace, was submitted to and approved by the recently established Fine Art Commission ; and, if not, would he indicate why it was not so referred ; and what was the cost of the lighthouses.

Mr. Jowett said that the refuges in question were temporary and of a purely experimental character. The experiments were being conducted in consultation with the Commissioner of Police in the interests of the safety of the public. The Fine Art Commission had not been consulted, but the question of the design and type of permanent refuge was under consideration.

New Subsidy for Rural Areas.

Mr. D. Millar asked the Minister of Health if he was now in a position to state the amount of the subsidy proposed by the Government to meet the housing needs in rural areas.

Mr. Greenwood said as a result of discussions with the representatives of rural authorities an Exchequer grant of £12 10s. a house for 40 years in agricultural parishes would be proposed.

Housing Costs.

Mr. Wheatley informed Sir E. Cecil that payments made from the Exchequer in respect of annual housing subsidies during 1923–24 amounted to £7,857,000. The payment from rates in respect of annual loss on the Housing Act, 1919 (penny rate scheme) was estimated at £866,000. He had no information as to the payment from rates in respect of annual loss on the schemes carried out by local authorities under the Housing Act, 1923. The capital expenditure defrayed from loans during the year was estimated at £11,000,000.

Office of Works Houses.

Mr. Jowett, First Commissioner of Works, informed Lieut.-Commander Kenworthy that the construction of houses by his department on behalf of certain local authorities was authorised by Section 16 of the Housing, Town-Planning, &c., Act, 1919, which had now been repealed. Under the revised proposals to be submitted by the Minister of Health, the responsibility for the erection of working-class houses would rest with the local authorities.

War-time Buildings.

Mr. Jowett informed Sir H. Brittain that the demolition of the aircraft buildings in Regent's Park, which were the only war-time buildings r maining in this park, was commenced on April last. The demolition would take about seve months to carry out, and the work of reinstati the surface of the park would be completed soon as possible after the buildings had be removed.

Loss Under the 1919 Act.

Mr. Greenwood informed Mr. E. Brown th the average annual loss per house in respect houses erected by local authorities under t terms of the 1919 Act was estimated at £50 p annum, of which £5 was borne by rates and £ by the Exchequer.

Unemployment.

Replying to Mr. T. Thomson, Mr. Shaw sa the following table showed the highest ar lowest monthly rates of unemployment amor insured workpeople in the building industr recorded in the years 1918 to 1923, and in t first four months of 1924 :—

	Highest.	Lowest.
1918	5.3	0.5
1919	11.4	4.2
1920	7.3	2.0
1921	19.8	8.8
1922	21.5	14.2
1923	20.1	11.3
1924	14.9	8.7

The A. and S.A.P.U. Sports Meeting.

The members of the Architects' and Surveyor Assistants' Professional Union are holding sports tournament with the Associated Portlan Cement Manufacturers at Snaresbroo (L.N.E.R.) on June 7, at 2.30 p.m.

City Coroner's Report.

In the course of his report, Dr. Waldo, dealin with the report of the Royal Commission o Fire Brigades, said he was of opinion that complicated panel system of fire inquiry, a suggested in the report, would result in a cost and comparatively ineffective experimen Again, the "panel of persons possessin special technical qualifications in buildin construction, engineering, fire extinction, &c., would presumably be largely drawn from th architects, surveyors, engineers and firemen i the service of the authority calling for th inquiry. As such, they would, in many in stances, be directly interested in the circum stances of the fire and the result of the inquiry The London County Council Fire Brigade Com mittee recently considered this report, an decided that, in their opinion, the appoint ment of a "Fire Adviser" was unnecessary.

Norwich Union Fire Insurance Society, Ltd.

The annual general meeting of the Norwic Union Fire Insurance Society, Ltd., was hel recently at Norwich, Sir Gerald H. Ryan, Bart in the chair. The net fire premium incom amounted to £2,115,068. Losses paid an outstanding, £1,069,107 net. The sum o £135,299 was carried to profit and loss. Th fire funds at end of 1923 amounted t £2,046,000. The accident premium incom amounted to £1,451,434, and the claims pai amounted to £793,681 and £33,688 was trans ferred to profit and loss. At the close of th account the funds of this department amounte to £1,095,000. In the marine account th premium income amounted to £345,602 which with the balance brought forward, gave a tota of £881,342. The sum of £28,213 was carrie to profit and loss in respect of the year 1922 The marine fund at the end of 1923 amounte to £572,134. The total premium income fron all departments was £3,912,105. In the profi and loss account the balance brought forwar was £156,125 and £197,201 was credited, bein the transfers from the fire, accident and marin accounts. Interest and dividends (less tax amounted to £164,918. After debiting dividen and debenture interest, income tax in respec of profits earned up to December 31, 1923 and colonial and foreign taxation, the accoun closed with a balance of £213,664. The tota assets of the Society stood at £5,497,811.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, cannot accept responsibility for contributed ies, especially on legal matters.

lay we appeal to our correspondents to mit their queries on paper of a size easily , and written as legibly as possible, or better , in typescript?—ED.

Laying-Out a Building Site.

[REPLY TO J. LANDELL NICHOLSON.]

IR,—Whether, in the district referred to, local authority is rural or urban is not ntioned in the question.

t is assumed the half street was laid out, the large villas on the 300 ft. deep sites ted to the approval of the local authority. he fact that the street in question is still rate and not taken over does not affect the nts raised by the enquirer.

Inder Sec. 157 of the Public Health Act, 5, an urban authority may make (and ally does make) by-laws with respect to els and widths of streets, the structure of lls, foundations, &c., of new buildings, suffi- ncy of air space around buildings, drainage buildings, &c.; and, by Sec. 158, when a ice plan or description of any work is uired by any by-law made by an urban hority to be laid before that authority, it ll within one month signify in writing its roval or disapproval of the intended work. s last section is in force in every urban rict, also in every rural district, that has pted Part III of the Public Health Act, 0. The disapproval of the authority is of avail, if it can be shown that a by-law has been disobeyed; though, of course, it is ilous to proceed without such approval (see v. Tynemouth R.D.C. (1896) 2 Q.B. 230). local authority must either approve or pprove. It has no option. It has been l that it has no right to enquire into the t or the title of the person proposing to ld on the land to which the plan submitted tes (see ex parte Crosby (1877) 41 J.P. 740). Thomson *v.* Failsworth (L.B. (1881) 46 21), however, where a builder whose plans local board had approved, had not sufficient l on which to comply with the by-laws to se a street, and which fact was not known he local board till after the houses had been lt, it was held that the local board should e satisfied itself before sanctioning the ns that there would be sufficient land upon ch to make the street when the houses uld be completed.

local authority can take into consideration tters brought to their notice, which show t a plan submitted cannot be carried out. R. *v.* Tynemouth Cor. (1911) (2 K.B. 361) lan submitted showed the greater part of y-out was on a meadow field, and the local hority was advised that the field must under ain restrictive covenants be kept for ever rable or pasture land, "and for no other pose." The plan was disapproved. It held that the local authority had juris- ion to refuse approval, on the ground that view of the restrictive covenant the plan ld not in fact be carried out.

n equity, a restrictive covenant relating to l will be enforced by injunction against all sons who subsequently take the land; unless obtain the legal estate therein for value ıout notice of the covenant (see Tuck *v.* hay (1848) 2 Ph. 774). Therefore, in a ding scheme the benefit of restrictive nants entered into by one purchaser of a is attached to the plots bought by the r purchasers; and they are entitled to rce the covenants, not only *inter se*, but against any sub-purchasers or (as to unsold s) against the vendor (see Birmingham rict Land Co. and Allday (1893) 1 Ch. 342.) right to enforce such covenants may be by delay or acquiescence in the defendant's ch of the covenants, or by the plaintiff or his predecessors in title causing, or permitting, such an alteration in the character of the neighbourhood, that the enforcement of the covenant would be unreasonable (see Sayers *v.* Collyer (1884) 28 Ch.D. 103; Bedford *v.* British Museum (1822) 2 My & K. 552; Sobrey *v.* Sainsbury (1913) 2 Ch. 513; and Frost *v.* King Edward VII Welsh, &c., Association (1918) 2 Ch. 180).

A rural authority, unless it be vested with the necessary urban powers, cannot regulate the line of buildings in a street. When, however, the Public Health (Building in Streets) Act, 1888, is in force (as in all urban districts, also rural districts, and contributory plans when the Act has been applied), it is illegal, without the written consent of the authority, to erect or bring forward any house or building or part of a house or building . . . in any street beyond the front main wall of the house or building on either side thereof in the same street. An approval in writing, by the council, of plans showing an infringement of the building line, suffices, even though the Council's attention was not particularly directed to the projections (see Merrett *v.* Charlton Kings U.D.C. (1903) 67 J.P. 419, and Mullis *v.* Hubbard (1903) 2 Ch. 431). An adjoining building must be looked at as a whole. A particular wing or projection cannot be regarded as the front main wall (see A. G. *v.* Edwards (1891) 1 Ch. 194). Sec. 3 of the Act applies to a house having another building only on one side of it; and, if there are buildings on both sides, the line of the least prominent one must prevail (see Leyton L.B. *v.* Causton (1893) 57 J.P. 135. and Anderson *v.* Richards (1906) 70 J.P. 231).

From the foregoing answers to the questions specifically put are as follows:—

(1) Yes. The local authority must approve or disapprove; and is not concerned with any restrictive covenants, provided the by-laws can be carried out. It is entitled to take into account all matters not shown on the plans that might prevent compliance with by-laws.

(2) In general, yes, as against the defaulting owner or owners in respect of the restrictive covenants. Reference should be made to the conveyance for particulars as to value of buildings to be erected, the number of houses on one plot, whether detached or semi-detached, the building line, &c.

(3) Against the owner of the field by one or all of the adjoining owners on the estate; and against the vendor when unsold plots.

(4) The local authority has power to approve a plan submitted showing the building line brought forward, but see above.

(5) The ruling cases, &c., are given above when necessary.

O.P.

Rubber Paving.

SIR,—I have been asked to arrange for an old wood bath-room floor to be paved with rubber squared paving, but am a little nervous lest by sealing the surface of the floor, dry rot might be set up. I propose, in order to avert the disaster, to take off the skirting, saw off the sides of the floor boards against the walls which take the ends of the joists, and bore a series of holes in the skirting when refixed to maintain a constant through draught. Do you think that such a procedure would adequately meet the case? Other alternatives would be welcomed.

"SANITARY."

Cracks in Plaster.

[REPLY TO "HOUSEHOLDER."]

SIR,—If the trouble is as suggested by your correspondent all settlement should have finished after this long interval, and it should be safe to cut out and make good the cracks. The fact that the crack is apparently confined to one wall suggests, however, that there may be another cause such as loose ends of laths, or a run of hot water pipes above the ceiling. The latter might be a very probable cause, and these pipes should be insulated before making good the cracks if they are not to recur.

"DOUBTFUL."

Iron Tank Leakage.

[REPLY TO "ARCHITECT."]

Our correspondent should have the leakage soldered up and made good, and then coat the inner surface with bitumastic paint, applying a second coat of the same when the first is dry. This has been found quite a success in similar cases. We do not mention trade names except in very exceptional cases, but our correspondent will find the names of several reliable firms within our advertisement columns.]

Domestic Hot Water Troubles.

SIR,—May I take the opportunity of thanking those of your correspondents who have sent advice upon my difficulty, and of expressing how very helpful and practical this has been?

ARCHITECT.

EXHIBITION NOTES

THE WALKER GALLERIES.

Amongst the varied shows which the Walker Galleries provide throughout the year, we count the Pastoral Exhibition one of our chief pleasures, and we have this year a collection of high quality and charm. There are drawings here which seem to reach nearly perfection of their kind, such as "The Old Barn," by Gerald Ackerman (No. 3); "The Afternoon of a Wet Day," by Eyre Walker (No. 10); "The Moonlight Twilight," by the same artist (No. 9); "Strathfield Mortimer," by Chas. Harrington (No. 24); and drawings by Murray Smith and S. Lamorna Birch. The vivid force of the land and trees against the delicate sky in "Strathfield Mortimer" has surely never been surpassed.

Some interesting Swiss sketches, by J. Hardwick Lewis and Mrs. Redman are on view; some of those by Mrs. Redman have a definite charm of colour.

THE FINE ART SOCIETY.

Out of some two dozen invitations to picture shows which lay before us this week we should least have liked to miss the Fine Art Society's. The Walcot Exhibition should be seen by every architect. If Walcot is too Walcotian for expression of modern architectural individuality, he can at least claim to be a host in himself. He shows us in No. 17 that even Charing Cross Bridge can be made to serve an artistic purpose; he shows an original and piquant point of view of the County Hall; and he gives us a shorthand note of the Arc de Triomphe, which invests it with quite a fresh interest. Wherever he goes, he makes his pictures. In New York, with his "Fifth Avenue," he is as pleasing as in views of Rome. He can be as tender and delicate as anyone, yet he is as virile as the best in his "Bernini's Fountain" (No. 19) and the "Piazza Termini" (No. 42).

THE LEICESTER GALLERIES.

Extremes meet in the Leicester Galleries. Anything more unlike than the spontaneity and refreshing colour of Frederic Whiting's paintings of country life and the laboured and saddening drawings by Paul Nash one could hardly imagine. Some of the Whiting water-colours are especially attractive, with a verve and breadth which one sees little enough of; these pictures should secure a large measure of appreciation. At the same Galleries the fine drawings and models by Elsie Henderson prove her in the first rank of living artists. The vigour and character of her modellings and the fine decorative sense which pervades them should find a ready market amongst those who know and can afford. This is a kind of work which may be highly valued by well-to-do connoisseurs, but one would like to think that this able artist was doing something for the permanent decoration of our buildings. Her fine drawings, whilst they fill their frames with a satisfaction of composition, exhibit the character of the animals with a vitality and truth which it would surely be difficult to surpass.

THE BUILDING TRADE

THE LAW RELATING TO BUILDING

By W. T. CRESWELL, Lic.R.I.B.A., F.R.San.Inst. (Barrister-at-Law).

IX.—TENDERS.

Obtaining of Tenders.

A building contract may be let direct to a contractor, without first obtaining his tender for the work, *e.g.*, in the case of jobbing works. In every such case, however, the contractor is entitled to "fair and reasonable" prices.

Lump sum contracts are the general rule, and in this case, usually, tenders are invited either in limited or open competition; the former by special invitations, and the latter by public advertisement. In either case, there is an invitation by the employer to contractors to "treat"—"an offer to receive offers"—and there is no liability thereby incurred by him in regard to any expenses to which the contractors may be put in tendering. But, on this score, there is a moral responsibility on the invitor to give precise particulars in the invitation issued. It is usual to state that the employer does not bind himself "to accept the lowest or any tender," though, legally, there is not any claim on him to state this, since, in the absence of this, there is no promise to any of those tendering that any tender will be accepted. See Spencer *v.* Harding (1870), L.R. 5 C.P. 561.

Revoking Invitation to Tender.

The invitation to tender may be revoked at any time by the employer; and, even in this event, no contractor has any claim on the employer for expenses incurred. See Harris *v.* Nickerson (1873), L.R. 8 Q.B. 286. Fraud (*e.g.*, giving special particulars to any one or more contractors so as to give them any particular advantage over others) renders the invitor liable for damages for deceit.

The Acceptance.

No tender should be accepted immediately on receipt of it, except under a condition that the contractor undertakes to sign a formal contract to be presented subsequently. Nevertheless, an obvious intention, in the written acceptance, that a formal contract will be submitted subsequently (which intention is not carried out by the presentation to the contractor of such a document), does not affect the binding nature of the tender and acceptance, if it is clear therefrom that it was the intention of the parties to enter into an agreement. See Lewis *v.* Brass (1877), 3 Q.B.D. 667. Here, the plaintiff advertised for tenders, and the defendant, a builder, sent in a tender which was accepted duly. No "formal contract" was mentioned in the advertisement; but the acceptance contained a statement that a formal contract would afterwards be prepared. The defendant, before signing such formal contract, found he had made an error in his estimate and tender, and wrote withdrawing his offer. Eventually, other builders were employed; but the resulting expense to the employer was very much in excess of the price tendered by the defendant. It was held that the contract was complete and binding on both parties; and that the defendant was liable to the plaintiff for the difference between his tender and the actual cost of completion by another.

Offer and Acceptance.

In general, to establish the existence of a contract, an offer and the acceptance of that offer, must be proved. The offer must be legal and precise, and there must be proof of communication of both offer and acceptance. Similarly, the acceptance must not be unduly delayed, and must be absolute and identical with the offer. If a time is fixed in the invitation at which the offer will be accepted if at all, communication must be within the time so prescribed.

In the absence of any special documents defining the exact terms of the contract, the Court will deduce or uphold a statement of the terms governing the contract, compiled from the terms of other documents relevant to the agreement, the customs bearing on the specific case, and the conduct of the parties.

Withdrawing the Tender or Offer.

An offer may be withdrawn at any time prior to the acceptance, even though the party giving the invitation promises to keep it open for a given time, unless the offer is under seal or made for a definite consideration. See Ramsgate Hotel Co. *v.* Montefiore (1866), L.R.I. Ex. 109; Bristol and Cardiff Co. *v.* Maggs (1890), 44 Ch. D. 616.

But the withdrawal of an offer must reach the other party before he has communicated his acceptance; and proof of having posted his acceptance prior to receipt of the withdrawal is enough, even if the letter of acceptance be lost in the post.

An offer is no less binding because it is headed "estimate." In Croshaw *v.* Pritchard (1899), 16 T.L.R. 45 the contractor wrote "Estimate—Our estimate, to carry out the sundry alterations, etc., etc., amounts to the sum of £1,230." The plaintiff accepted at once this "offer to execute for the sum of £1,230" the work in question. Subsequently, the contractor discovered an error in his calculations, withdrew his offer, and refused to complete. Another builder was engaged by the plaintiff and carried out the work, but at a higher figure. The plaintiff then sued the defendant for damages for breach of contract. In giving judgment for the plaintiff, Bigham J. said, "It had been suggested that there was some well-known understanding that a letter in this form (*i.e.*, headed "Estimate") was not to be treated as an offer. There was no such custom, and if there was, it was contrary to law."

Custom, if fully established by accredited witnesses, is usually accepted by the Court as evidence.

In Pauling *v.* Pontifex (1852), 1 W.R. 64, it was held, on appeal to the Queen's Bench, that the conduct of the parties was such that, coupled with a custom of the trade, it implied an acceptance of the lowest tender.

Tenders coupled with Special Conditions.

The tender submitted by a contractor may be either unqualified—when it is assumed that he unreservedly accepts the conditions of the contract put before him by the invitation; or it may be submitted coupled with certain reservations or conditions modifying the text or implied intention of the invitation. In the latter circumstances, it is the responsibility of the employer to carefully consider any such conditions or reservations before accepting the offer. If he accepts without questioning these modifications, it is assumed that he includes and confirms them as a part of his agreement with the contractor.

Lowest Tender.

In some cases the employer does bind himself to accept the lowest tender; but an offer from any contractor to "do the work for £200 (or any other sum) less than any other tender" is to be rejected, as not being a genuine offer; and the terms of the invitation could not be read as compelling the invitor to accept it.

In the South Hetton Coal Co. *v.* Haswell Coal Co. (1898) 1 Ch. 465, the vendor of certain coal agreed to accept the highest money tender amongst any sealed tenders received from intending purchasers. One offerer tendered to "exceed the highest offer by £200." The Court struck out his claim for "Specific Performance" against the vendor who had refused his offer as not a "net money offer."

Sureties.

A contractor may be required by the invitation to find sureties, approved by the employer, for his due execution of the work.

Acceptance of Tender by the Architect.

It is not advisable for the architect to accept any tender on behalf of his employer except on condition that the contractor subsequently signs a contract in customary form, and, if advisable, agrees therein to find sureties for his due performance of the contract. And, as previously indicated, the contractor is bound to fulfil (or relieve the damage incurred by his refusal to fulfil) any contract once it has been duly accepted, whatever may be his loss. He is responsible to exercise due care in estimating. In Seaton Brick Co. *v.* Mitchell (1900), 2 F. Ct. of Sessions 550, the defendant had tendered a price, £859, which was duly accepted. Subsequently he sought to withdraw his offer, pleading that the estimate had been made by his son, and was a miscalculation, and should have been £1,1[illegible]. He refused to fulfil his agreement, and the work was carried out by the contractor who had submitted the next lowest tender, viz. £1,085. Lord Moncrieff, in giving judgment to the plaintiff for damages for breach of contract amounting to £226 (the difference) said, "When the defendant's offer was made the architect had nothing before him to indicate that any mistake had been made on the part of the offerer. Now, I understand the law to be that a party who enters into a contract, under a mistake, must be held to it unless the mistake was induced by the other party, or was brought under the other party's notice before acceptance."

Unauthorised Acceptance.

The employer is not bound to accept a tender which has been accepted by anyone but himself or his authorised agent; nor is the contractor bound by any such unauthorised acceptance. But if, by word or act, the employer ratifies such unauthorised acceptance then both he and the contractor are bound from the date of such ratification.

Careful Consideration of Tenders before Acceptance.

Though it may have been shown that the employer or his agent may reasonably accept a tender without keen scrutiny in the case of a lump sum contract, yet very careful and skilled scrutiny is advisable when the contract in question is to be carried out on a tender schedule of prices and measurements taken *in situ*.

Because, it is possible for a contractor to submit a schedule which promises an acceptable total cost on the face of it; but, in which schedule, items likely to be in excess of the calculated quantities, are priced high and those likely to fall short of the estimated quantities are priced low; in this way the contractor seeks to gain unduly on additions and lose lightly on omissions, the employer losing both ways. Of course, this would occur, if at all, when the contractor has special knowledge. For instance, in the case of excavations through several strata of harder and softer rock; and where the co

tor had more exact local knowledge of
n strata at the site of the excavations,
n that possessed by the employer or his
nt. Such a ruse should easily be detected
a careful comparison of prices considered
relation to each other.
Where large works are in contemplation,
re is sometimes prepared a comparative
mary of schedules tendered, for the con-
ration of the employer. Not only must
total prices be compared, but the indi-
al items; and careful attention given to
special quotations in order to see that the
nded profits are reasonable and in the
rests of the employer.

Mutual Agreements amongst Contractors.

Several contractors may make mutual ar-
gements to abstain from tendering for a
sideration, or to share the work tendered
by one of their number; and such arrange-
nts have been held to be binding on the
eral individuals concerned in the arrange-
nt.
n Metcalf *v.* Bruck (1871), 25 L.T. 539.
and B agreed not to tender in competition
inst each other, so that B obtained the
tract. On the expiration of the contract
s obtained, fresh advertisements for sup-
of the same commodity were issued by
same invitor; B again tendered and his
der was rejected. A then, without inform-
B, sent in a tender. A was held liable
B by the Court for breach of their original
eement.
n Jones *v.* North (1875), 19 Eq. 426.
ders had been invited for the supply of
ne to a corporation. An arrangement was
ne to between A, B, C and D whereby it
s intended that A was to, and he did,
in the contract, he agreeing to purchase
ne from B, C and D at an agreed price;
, in their turn, agreeing not to supply
corporation with stone during the current
r. B, however, sent in a tender which
accepted; but the Court granted an in-
ction to A restraining B from supplying
e during the year agreed upon.
everal vendors of any commodity may
ee, and in agreeing bind themselves, not
ell below a fixed minimum price. This is
pted as a legal arrangement, but might
be declared void, as acting in restraint
rade, and so being against public policy.

Stamping of Agreement.

t least one of the documents governing the
ract must be stamped.
under seal, the stamp duty is ten shil-
s. and the stamping must be done at the
ip office either before execution or within
lays after.
not under seal, and the contract price is
or upwards, then the duty is 6d. (six-
ce); and it may be paid by affixing an
sive stamp, which stamp must be can-
d at the time of signing the contract and
the signature of the first party to sign.
an adhesive stamp is not used, but the
ument is stamped at the stamp office, then
stamping must be done either before
ution or within 14 days of execution.
e penalty for non-stamping is £10 in each
.

Hospital Architecture.

r Berkeley Moynihan recently gave
outline of what he considered to be
ideal modern hospital. He said there
ld be very little of forbidding-looking
dings of bricks and stones; the hospital
ld be built so that 40 years hence it
d be destroyed without much loss in order
eep pace with the advancement of medical
ice. During the war, patients in tents did
h better than those in buildings. If new
itals were to be built the question would
to be seriously considered as to whether
as really worth while putting so much money
rather heavily shaped buildings of bricks,
e and mortar.

PRICES OF BRICKS

OFFICIAL REPORT

THE fourth interim report of the Inter-Departmental Committee appointed to survey the prices of building materials, was issued recently (Cmd. 2,153, price 6d. net). The terms of reference were:—

To survey the prices of building materials and to receive and consider complaints in respect thereof, and to report from time to time to the Minister of Health and the President of the Board of Trade as to the facts, and in particular as to the extent to which in any case the price appears to be unduly high by reason of the operation of any trade combination, trust or agreement.

We take the following extracts from the Report:—

Since the appointment of the Committee in April, 1923, up to the early part of this year, the price of bricks generally remained fairly steady, although there were, of course, some local fluctuations, and with the exception of the London area, to which reference was made in the Committee's Third Interim Report, no great difficulty as a rule was experienced in obtaining adequate supplies for building purposes.

In the early part of this year the demand for bricks increased considerably, and it has since continued to expand, with the result that in many areas, notwithstanding an increased production, the available supply of bricks has proved inadequate to meet requirements and numerous instances have been reported where house building has been delayed through inability to obtain adequate deliveries.

In the Chairman's report on the prices of building materials during the month of February of this year, increase in the price of bricks were shown in five of the centres selected by the Committee. Further increases were indicated in the subsequent monthly reports, and the following tabular statement shows the various advances in brick prices reported to the Committee between January and May of this year:—

District.	Description.	Price per 1,000. Jan.	Feb.	March.	April.	May.

Apart from the 12 centres included in the monthly schedules of prices, which we selected as being representative as far as practicable of our general conditions, we have had brought to our notice many other instances of increases of varying amounts in brick prices in areas not actually covered by the schedules, and it would seem to be clearly established that throughout the country generally the price of bricks has risen considerably.

The prices recorded in the schedules relate to those normally fixed by the manufacturers individually or in associations. It does not, however, follow necessarily either that the price at which bricks may be obtained will be the recorded normal price or that bricks will be obtained in sufficient quantities, or indeed at all.

It has been represented to us that for actual or adequate deliveries additional increases to those recorded are charged and obtained. Such increased charges vary in circumstances and amount, but there would seem to be good reason to think that the general prices which have to be paid in order to obtain bricks are at present often in excess of those which we have recorded, and therefore that the actual increase is greater than would appear from the figures which have been given above.

We initiated preliminary inquiries when the upward trend of prices first became apparent, and such information as was immediately available attributed the increase mainly to an advance in the price of fuel or to the depressed condition of the industry during the previous year when, it was stated, it had been necessary to dispose of surplus stocks at unremunerative prices. In other cases local advances in wages were said to have been conceded.

There is evidence that in some districts there has been an advance in the price of fuel and it may well be that some local wage increases have been granted, though we understand that no settlement has so far been effected generally in the clay industry. By further inquiries we could no doubt have obtained from the manufacturers the actual increase in cost per ton of fuel and in the rate of wages, but an inquiry which was limited in its scope solely to these particular items in the total that go to make up the cost of production would clearly be inadequate, and having regard to the general situation and to the indications that there had been an appreciable increase in production, which should have a material effect on overhead charges, we thought it necessary as a first step towards a satisfactory investigation that we should endeavour to obtain further and more detailed information as to output, production costs, and profits at the present time as compared with the previous year.

For this purpose we addressed inquiries to certain of the local associations and manufacturers in the areas where increases in price had occurred, but up to the present we have not obtained any satisfactory information, and we

therefore are not in a position to report with any degree of reliability as to the true facts of the situation, and as to the justification or otherwise of present prices. Some manufacturers have stated that it is impossible for them to furnish all the detailed particulars for which we have asked; others have proved unwilling to give information, and from others we are still awaiting replies. We have reluctantly formed the opinion, judging by the response so far made to us, that our further investigations on the present basis will not be productive of any tangible results.

At our first meeting it was intimated to us by the Minister of Health, the Right Hon. Neville Chamberlain, that he hoped that the object he had in view in setting up the Committee would be achieved by publicity, but if this were found not to be the case he was fully prepared to go to Parliament and ask for powers,and we undertook that we would at once notify him if such a situation arose. Our function is at present limited to reporting on the basis of such information as may voluntarily be submitted to us, and as a result of our experience we feel bound to report that we find ourselves inadequately equipped to ascertain the facts in regard to the reasonableness of prices.

The Report is signed as follows:—

A. V. ALEXANDER (Deputy Chairman), THEODORE CHAMBERS, CHARLES T. RUTHEN, G. S. BAILEY, R. COPPOCK, STEPHEN EASTEN, GEORGE HICKS, J. STANLEY HOLMES, W. T. LANCASHIRE, CECIL B. LEVITA, D. RONALD, J. WALKER SMITH.

Mr. A. V. Alexander, in the course of a letter, adds the following to the Report:—"The Committee's Fourth Interim Report is concerned with the position in regard to bricks and it is not necessary for me to draw attention to the matter here. It will be seen that there has been a further fall in the price of lead ranging, according to the various districts, from £2 to £5 10s. a ton. Otherwise there have been no fluctuations of general application to which attention need be drawn."

Tables are given showing the market prices of building materials in London, Birmingham, Bristol, Leeds, Leicester, Manchester, Newcastle-on-Tyne, Swansea, Hampshire, Dundee, Edinburgh, and Glasgow.

THE NEW HOUSING PROPOSALS

MR. WHEATLEY, Minister of Health, in moving in the House of Commons on Tuesday the financial resolution which is to form the basis of the Government's Housing Bill, said that the Housing Act of last year had been a complete failure in producing houses to be let at a weekly rental. He had sought to deal with the building industry in a spirit of goodwill and not of force, and his new proposals were not Socialistic, but an attempt, in the interests of humanity, to patch up a battered capitalist order of society. In order to get the essential labour for the erection of houses, it was necessary to stabilise the building industry by the adoption of a long-term programme. He had told both employers and men that, if they were prepared to accept a fifteen years' programme on condition that they delivered a certain number of houses every year, he was prepared to consider entering into such an arrangement, and ultimately an agreement was made on that basis. That scheme would work automatically, so far as the building industry was concerned. It would be examined at the end of three years, and if the average of houses agreed on by the State and the industry was not being maintained, then the agreement would automatically terminate. If the output of houses was maintained, the agreement automatically proceeded for a further period, when stock would again be taken. If the increased number of houses was being maintained, the scheme would go on for a further period, and so on for fifteen years, when they should have produced 2,500,000 houses. The houses to be produced were those of the subsidy type, and were additional and not alternative to those of the larger type that were being produced outside the subsidy limits. The builders said they must have some protection against higher costs of building materials. He accordingly interviewed the manufacturers and merchants of building materials and the Associated Brick Manufacturers made what he thought was a very generous offer. They said they were prepared to take the price ruling at January, 1924, as the basis of prices for future building under his housing scheme. He did not think the nation could get a more generous offer. The Bill would deal with this matter and would provide that, unless it could be proved that any increase over these prices were fully justified, the charging of such increase would be regarded as a serious offence.

Referring again to the long-term building programme, Mr. Wheatley said it had been objected to on the ground that no other industry was given any such protection, but the building industry was quite separate and distinct from any other. The Government were not preparing to sanction more houses than they would otherwise sanction; they were merely ordering ahead. If they wanted to get houses, they must stabilise the industry in the interests of all concerned.

It was proposed to set up three committees, one composed of builders and operatives, another of manufacturers and merchants of building materials, and the third was to be a prices survey committee. These three committees would be interlocked by three representatives of each sitting as a sort of supercommittee, a national building committee, set up by the Ministry of Health. The object of these committees was to see that the new housing scheme was successfully carried out. They would operate in seeing that there was a sufficient supply of labour and materials available. There would be a central committee, and for the builders and operatives there would be local committees to assist and advise local authorities. Assuming that Manchester wanted to build 5,000 houses, it would be the business of these committees to advise Manchester as to the available labour and materials in the neighbourhood, and how far it could be augmented so as to balance orders for building with the supply of material and labour. One of the great defects of the Addison scheme was that there was no attempt at all at balancing supply and demand, and the fundamental object of the present scheme was to relate supply and demand and to build houses where most labour and material was available.

The subsidy to local authorities was to be £9 a year per house for forty years, and, in defined agricultural areas, £12 10s. The amount of the subsidy was to be revised every three years. The rents to be charged for the houses were to be as nearly as possible those prevailing now in the areas for working-class houses erected before the war. The annual expenditure would be thirty-four million pounds for the State and local authorities combined. That was only one per cent. of our national income and was only equal to ten per cent. of the national drink bill. But there was much to be put on the credit side. The scheme was one under which they could visualise the building industry growing stronger and stronger every year and our people being taken from the shadow of the slums.

In the debate which followed, the scheme was severely criticised by Sir W. Joynson-Hicks, who said that the Minister proposed to suspend the laws of supply and demand. The capital subsidy proposed under the 1923 Act was only £75 a house, but the present value of the subsidy now proposed was about £240 per house. The burden of the proposed subsidy would amount sooner or later to something like fourteen-hundred million pounds, and the total cost of the scheme to the country would be two thousand, five hundred millions sterling, or, roughly, about one-third of our national debt. The Minister contemplated a too lavish use of subsidies. Houses could not be built without labour and the Minister shirked that issue.

LIABILITY FOR INJURI AFFECTION OF PROPE

SITTING at the Auctioneers' and Agents' Institute, Mr. J. Seagram R son, as umpire, heard claims by M Coish and Mr. S. T. Smurthwaite fo and £1,000 respectively, as damages jurious affection of Nos. 44 and 46. G Green-crescent, alleged to be due to th struction by the London Electric R Company of a viaduct and bridge in fr those houses.

Mr. A. Boraston was counsel for the ants, while the Hon. R. Stafford represented the Railway Company.

In opening, Mr. Boraston said the r bridge was finished in 1923, and consid diminished the amount of sunlight i front rooms, and obstructed the view created loss of privacy, amenities, and advantages.

Mr. Crump said the value of No. 44 the construction of the bridge was £2,(£2,100; now he put the value at £1,200. 46 was worth £4,000 before, and £2,7 £2,500 at present values. The test for tion in his presence gave negative resu

On behalf of the railway company Hon. R. S. Cripps said his case was th legal claim could be set up under any four items for which damage was cla namely, loss of light, loss of privacy, lo amenities, and damage by vibration. Re ing the first item, there were no an lights, and clearly no right of the claiman that respect had been interfered with. regard to compensation where no land taken, and injurious affection arose, the ciples of legal claim set out in "Cripps Lord Parmoor) on Compensation" limited to loss or damage which must r from the acts caused by the exercis statutory powers; damage or less w would have been actionable but for statutory powers; damage occasioned by construction of the authorised works; o jury to lands, and not personal or that ca to trade. None of the losses set up by claimants were actionable; there was no of ancient lights; the claimants had no v right to privacy as people could build oppo and no action could lie for loss of ameni There had been no evidence of what the had been, and the claim for vibration knocked out altogether. If the umpire sidered that compensation should be awa on either of the heads of claim, he Cripps) would ask him to state a case fo opinion of the High Court.

The Umpire: Certainly.

The Hon. R. S. Cripps said he should evidence with the reservation that in opinion of the law the umpire could award any damage at all. He admitted t were hard cases, but as the railway compa were dealing with public money they bound to take up the attitude that there no legal claim.

The umpire reserved his award which take the form of a special case for the opi of the High Court.

THE RENT ACT

SEPARATE DWELLING APPORTIONMENT

have from time to time drawn attention es illustrating the difficulty of interpret- ne Rent Acts where part of a house is a separate dwelling, and a recent de- of the Court of Appeal in the case v. Begley (1923, 2 K.B. 694) has done hing to explain the law on this point. acts of the case are shortly as follows: arch, 1921, two ladies had taken a large in Leamington on lease for five years rental of £100 a year, they agreeing to ates and taxes and do internal repair. g the war this house had been occupied e Air Force, and it had been left in te of dilapidation. The rateable value e premises in August, 1914, was £60 and £48 net.

June, 1921, the ladies, defendants in ction, had agreed to let four rooms on round floor to the plaintiff, a solicitor, the right to use other parts of the pre- such as the hall, basement, kitchen, in common with the landlords and other ts. The rent for this was £80 per n, the defendants paying rates and and keeping the main walls in repair. ructural alterations appear to have been

June, 1922, the plaintiff applied for an ionment of the rent, and the County Judge fixed the proportion of the rd rent of the plaintiff's portion of the and accommodation at £60 a year, and as affirmed on appeal to a Divisional

County Court Judge had said that if been left free by the decided cases to he would have held that the rooms in n were a dwelling house under the themselves, and with a standard rent amount of the rent agreed to for them they were first let in June, 1921, but e was constrained to hold as he had y the cases Woodward *v.* Samuels (*The* . February 27, 1920) and Sinclair *v.* (1922, 1 K.B. 393; *The Builder*, 28, 1922).

question as to whether rooms separately n part of the original house, with the the original house to be apportioned, or r they are separate dwelling houses standard rent of their own, has caused y ever since the initiation of Rent tion, and it will be necessary, first, ate the sections of the Act that are rela- this question, then to refer to the de- ases, and finally to show how the Court eal, in dealing with this case, has to xtent cleared up the matter.

on 12, subsection (1) (*a*) defines the d rent as the rent at which a dwelling was let on August 3, 1914, or where elling house was not let at that date t at which it was last let before that r " in the case of a dwelling house was first let after that date the rent h it was first let." Subsection (2) s that the Act shall apply to a house, of a house, let as a separate dwelling eference to certain rents or rateable " and every such house or part of a hall be deemed to be a dwelling house h this Act applies."

tionment of the rent of a dwelling s dealt with in subsection (3). Sub- (8) provides that " any rooms in a house subject to a separate letting or partly as a dwelling shall, for the s of this Act, be treated as a part of ng house let as a separate dwelling." ction (9) provides that the Act shall ly to a dwelling house erected, or in of erection, on April 2, 1919, or to elling house which has been since te or was at that date being bona- onstructed by way of conversion into more separate and self-contained flats nents.

ward *v.* Samuels has always been as a case where the structural altera- tions had not been such as to cause the house to have lost its identity, the test laid down in Sinclair *v.* Powell (*ubi sup*) and applied in Marchbank *v.* Campbell (1923, 1 K.B. 245; *The Builder*, December 8, 1922). Sinclair *v.* Powell was decided apart from subsection (9) as the house had been converted before the Act of 1920 came into force, and in Darell *v.* Whitaker (*The Builder*, May 18, 1923) it was first pointed out by one of the Judges in a Divisional Court that the construction put upon the Act in the case of Sinclair *v.* Powell seemed to make subsection (9) unnecessary. The answer to this point, however, seems to us to be that a house converted into two or more separate and self-contained flats under section 12, subsection (9) is taken altogether out of the Act, whereas houses let as separate dwellings need not necessarily be separate and self-contained flats, but may also be dwelling houses not part of the original house but having a separate identity with a standard rent of their own. The decision now delivered by the Court of Appeal in Sutton *v.* Begley is of assistance in explaining some of the above questions. There was no question in this case of subsection (9) as the appellants relied upon subsection (8), the argument being that as these rooms were subject to a separate letting, wholly or in part as a dwelling house, they were to be treated as let as a separate dwelling with a standard rent, the rent at which they were first let.

The decision of the Court of Appeal appears to clear up some of the above points, and we understand the decision to be as follows: Where a house is let in separate portions but with no structural alterations, the rent must be apportioned (Woodward *v.* Samuels), but where structural alterations have been made so that the house has lost its identity then the portions let off may have a standard rent of their own (Sinclair *v.* Powell; Marchbank *v.* Campbell). Besides these two cases there is the case where under subsection (9) the house since 1919 has been converted into two or more separate and self-contained flats. Under this latter subsection we may remind our readers there is now also another consideration which has to be taken account of in regard to such flats, which is are they separate and self-contained? See Smith *v.* Prime, *The Builder*, May 25, 1923; Darrell *v.* Whitaker, *The Builder*, May 18, 1923.

The law under the cases is thus made clear, but there remains some difficulty in understanding the Statute and especially subsection (8) as interpreted with the other subsections referred to above. As we understand the judgment, the application of this subsection (8) is to rooms in a dwelling house subject to a separate letting, but where no reconstruction has been undertaken, the house as a whole retaining its identity, and they are treated as a separate dwelling only for the purpose of apportioning the standard rent of the whole house amongst the parts so let. In the case under consideration, there having been no such structural alteration as to alter the identity of the house, it was held the rent must be apportioned, and to this extent the rooms were held to be part of a dwelling house let as a separate dwelling with an apportioned standard rent.

We hope this matter is now clear, but it certainly is to be regretted that the Legislature in the various subsections used such very ambiguous expressions.

Garden Village in Kent.

It is proposed to start shortly with the building of the first instalment of 176 houses at what will ultimately be a new garden village at Kemsley, near Sittingbourne, Kent. The layout provides for 750 houses to accommodate a population of 3,500 people.

NEW INVENTION

THE accompanying photograph shows the Wheeler "4 in 1" quick-change Combination Woodworker, which has been put on the market by the Wheeler Manufacturing Co., Ltd., Trench Crossing, near Wellington, Salop. This treadle-driven machine, combining on one frame a circular saw, lathe, fret or jig saw and boring machine, is specially designed for cabinet makers, carpenters, joiners, &c. Being driven by treadle motion it is always ready for use. An important feature is the small amount of floor space the whole combination of four machines requires. The illustration shows the machine with the lathe ready for use; this lathe will swing 10 in. diameter, and will take 31 in. in length between centres; by easing two locking handles the lathe can be swung bodily out of the way underneath the machine table, and locked in that position.

The circular saw is 10 in. in diameter, and has a quick and effective rise and fall motion so that the saw can be arranged at any height required above the table, and can be completely lowered safely below the top of the table when not in use. It will deal with planking up to 3 in. thick and practically any length, as there is a clear way through the back of the machine. Tongueing, grooving and rebating can also be done with the saw, and it

is fitted with machined fences for ripping and cross-cutting. The ripping fence is arranged to work either side of the saw, so that the edges of exceptionally wide boards can be trimmed.

When set up with boring machine and the fret or jig saw ready for use, either of these machines can be moved out of the way of each other, but the boring machine is often used in connection with the saw for putting the starting holes through for internal frets. The boring machine has a rise and fall motion of 8 in., in any position of which it can be locked, a necessary feature when it is used for routing and moulding. The spindle revolves in a quill, and the end is fitted with a chuck for holding the boring or routing bits; with suitable bits it will drill ordinary holes up to ½ in. or more. Cores of mortise holes can be got out, and with suitable cutters routing or recessing can be accomplished. An attachment for carrying small moulding cutters when used for a suitable fence enables moulds to be readily struck upon furniture, &c. By easing two locking handles the whole apparatus can be turned on one side out of the way if necessary.

The fret saw takes 8 in. saw blades, and the top arm can be lifted up out of the way when required. It will do all classes of internal or external scroll or fret sawing, and will cut up to 2 in. thick and to the centre of a circle 4 ft. diameter.

RATES OF WAGES IN THE BUILDING TRAD

The following are the rates of wages in the building trade in England and Wales. E endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur

★NO DATE.—**London, N.7.**—Teacher of Builders' Quantities; also Teacher of Structural Engineering and Reinforced Concrete. The Secretary, Northern Polytechnic Institute, Holloway, London, N.7.

Building in Canada.

Montreal and Quebec cities, according to the *Bulletin* of the Federation of British Industries, report that for this year an increase in the construction of buildings for business purposes is contemplated, though less for residential; but, in the Province of Ontario, it is anticipated that building will be hardly normal. According to certain real estate agents of Montreal, the costs of building in cities now run 50 per cent. material, 50 per cent. labour, the latter being a serious problem. High wages in the United States are having an unsettling effect on Canadian labour, particularly in Ontario, and a steady movement of skilled labour across the border is reported. A Chicago firm recently endeavouring to obtain plasterers from Toronto, offered 13 dols. a day of eight hours, and guaranteed sixty days' work. As an added incentive they undertook to pay transportation both ways.

Wandsworth Technical Institute.

On May 10 a party of building and surveying students, under the direction of Mr. Geo. Arnall, F.S.I. (Head of the Building Department), visited several places of architectural and technical interest in the Northants district. At Geddington the famous Eleanor Cross (erected by Edward I in 1295) was inspected. This cross, as mentioned by Parker in his "A.B.C. of Gothic Architecture," is, perhaps, the most perfect of all those erected in memory of Queen Eleanor; the decorated diaper work is particularly fine. The party next visited the mines of Messrs. Lloyd's Ironstone Mines Co., and great interest was displayed when the 300 ft. steam excavator commenced operations, moving nine tons of iron ore at each grasp. The works and blast furnaces were next inspected, including the modern machinery, and a furnace was discharged for the benefit of the visitors. At Kirby Hall photographs were taken of the beautiful work of Inigo Jones, and it is hoped that some will be reproduced in the technical press. Next the church at Fotheringay was visited. This specimen of a complete perpendicular building is dated 1435, and the building contract is still in existence. Mr. Arnall drew the attention of the students particularly to the wonderful flying buttresses. A halt was made at the ruins of Fotheringay Castle, famous as the scene of the execution of Mary Queen of Scots. Another visit will shortly take place, when it is hoped to visit Peterborough Cathedral and the Fletton brickworks, but for the moment the students are concentrating upon the outdoor land surveying classes which have recently commenced.

PROPOSED NEW BUILDINGS & OTHER WORKS *

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

ACCRINGTON.—Plans have been approved for three shops in Peel-street.—The Corporation have received sanction to their application for extensions to their electricity works at a cost of over £50,000.

Montrose.

rose War Memorial, which has been at a cost of £2,500, was unveiled recently. norial is the work of Mr. H. S. Gamley, and the pedestal was designed by Washington Browne, P.R.S.A.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Dumfries.—RESTAURANT.—The Dean of Guild Court has passed plans for the new Imperial Restaurant, to be erected at the corner of King-street and Queensberry-square. The estimated cost of the building is £5,000.

Brechin.—HOUSING.—The Board of Health has approved provisionally of the district housing scheme, and the C.C. has instructed the District Committee to borrow to the extent of £3,000, as required.

Sanquhar.—SCHOOL.—The Dumfriesshire E.C. propose to erect an intermediate school at Sanquhar.

Forres.—BAKEHOUSE.—The Dean of Guild Court has passed plans for a bakehouse in Academy-street, for the Scottish Co-operative Society.

Greenock.—HOUSE.—The District Combination Hospital have submitted plans to the Dean of Guild Court for a house to be erected for the physician and superintendent at Gateside Hospital. The plans were passed.

Newtongrange.—VARIOUS.—Offers for a new school at Newtongrange were approved, at a recent meeting of the Midlothian E.A., subject to the approval of the department. The amount of the offers was about £13,850. Tenders were accepted in connection with the erection of a janitor's house and a rural branch library at Musselburgh Grammar School, amounting to £1,430.

Perth.—HALL.—The Dean of Guild Court has granted permission to Mr. J. D. M'Inroy, proprietor of the York House Restaurant, to erect a hall at the rear of the premises.

Tillicoultry.—HALL.—The Corporation Plans Committee has received plans for their consideration in connection with the erection of a new hall proposed to be erected in connection with the E.U. Church.

Ayr.—VARIOUS.—The Dean of Guild Court has passed the following plans: Grand stand, &c., at an estimated cost of £5,800, for the Ayr United Football and Athletic Club, Ltd.; alterations to shops in Newmarket-street, for James Bowie & Co. house furnishers, estimated to cost £1,100; Mrs. J. MacDonald, buildings in Sandgate; J. S. Wilson, engineer, house in Seafield-road, estimated to cost £800; Charles R. E. Mapstone, house in Doonfoot-road, estimated to cost £1,100; Robert Dempster, alterations to house in St. Leonard's-road, at an estimated cost of £220.

EDINBURGH'S £450 HOUSES

MR. JAMES BROWN, M.P., as Lord High Commissioner to the General Assembly of the Church of Scotland, recently inaugurated the extensive housing scheme, which is being undertaken by the Edinburgh Corporation on the Lochend Estate. Mr. Brown laid the foundation of a block of houses, which form the first contribution to a housing scheme which is to comprise 1,000 dwellings erected on the duo-slab system. It is expected that all the houses will be ready for occupancy before the end of the year. The Convener of the Housing Committee explained the extent of the scheme. The 1,000 houses were estimated to cost £450 each, and in consequence of the simplicity of the system would give employment to a large number of unskilled unemployed.

Addressing the gathering, Mr. Brown said there were many things that came into their national life to make the people truly great and good, but there was nothing—after the Gospel—that contributed more to the uplifting of the people than the houses in which they lived, and nothing caused more irritation in the body politic than the insufficiency of houses. He trusted that the scheme would not only be a beginning for Edinburgh, but that, as the capital of Scotland, they would give a lead to other Scottish cities and towns in house-building. The Lord Provost afterwards formally opened a demonstration house. He said that, by the duo-slab system, which was invented by Sir Edwin Airey (Lord Mayor of Leeds), and contractor for the scheme, these houses had been built in four months, and with the same efficiency and energy on the new scheme they hoped to accelerate the provision of houses.

ARCHITECTS IN SCOTLAND

THE monthly meeting of the Incorporation of Architects in Scotland was held recently at Edinburgh, Mr. T. P. Marwick, F.R.I.B.A., President, in the chair. The present position of the draft model building by-laws was explained by Mr. Andrew Robertson (Glasgow), a representative of the Incorporation on the body dealing with the subject. The report of the Practice Committee, submitted by Mr. G. P. K. Young (Perth), included a communication from the Scottish National Building Trades Federation on lump-sum contracts. Mr. J. Inch Morrison (Edinburgh), submitted the report of the Competitions Committee, embodying a recommendation to adopt for Scotland the new regulations for architectural competitions just issued by the Royal Institute of British Architects; and Mr. James Lochhead (Hamilton), convener of the Housing and Town-Planning Committee, laid before the meeting the revised scale of architects' fees under new housing schemes. The final arrangements were made for the annual convention at Ayr on June 13 and 14.

Glasgow Memorial Hall.

The war memorial of Mount Florida U.F. Church, Glasgow, which takes the form of a church hall, was opened recently by Lieut.-Colonel J. F. Daly, D.S.O. Mr. George Boswell, F.R.I.B.A., architect for the hall, on behalf of the contractors and himself presented Lieut.-Colonel Daly with a gold key as a memento of the occasion. The new hall is a commodious building with rough-cast exterior. There are various ante-rooms, a vestry, a kitchen, and a lower hall—not yet finished—which will meet the needs of functions for which the main hall is unsuitable. The cost of the memorial is £4,173.

ILDING TRADE WAGES IN SCOTLAND.*

following are the present rates of wages in the building trade in the principal towns of l. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors y occur:—

THE BUILDER

JURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VI.—No. 4245. JUNE 13, 1924.

MR. WHEATLEY AND THE BUILDING INDUSTRY

IE proposals relative to housing now before Parliament constitute the gravest and most important measure which has ever affected the building industry. It may be said, indeed, that short of powers taken during the exigencies of war they constitute possibly momentous proposals ever laid before Parliament, for two reasons: First, the magnitude of the financial ing (alleged to involve considerably more than one million pounds); second, the introduction of a new of wholesale control of an industry in times of peace. only hope that Members of the House who have not welfare of the community at heart but also the many concerned with building are giving to these proposals ful and individual attention which such far-reaching n renders imperative.

s clear the air at the outset by repeating the assertion ry sensible person recognises the immediate need for rovision of small houses, a statement which might seem ıde were there not a tendency in certain quarters to ıat any criticism of Government housing proposals an attitude of indifference towards the squalor and ding it is wished to alleviate. We will go further s. We recognise in Mr. Wheatley a man of honesty se whose aim is the fulfilment of a promise made to nunity after the war that sufficient housing accom- ı should be provided. Now let us examine the Minister's as far as these are yet placed before us. The full ıe Bill is, as we write, not available, but the methods ting building costs have been before the House. We en pointed out in our columns that in human affairs of supply and demand is always the great dominating ich controls a situation. In exceptional circumstances occurred during the war legislation at variance with was necessary, and the dislocation, hardship and ience which followed were patiently borne as an e corollary. We maintain that in principle State-aid roduction of any material commodity is wrong. Let e mistaken. Circumstances may make it necessary, ould be regarded as a bad thing, to be dispensed with as possible, for not only does it react unfairly on other s or parts of the same industry not aided, but it pro- eat market dislocations and diverts Government from r function. The national memory is proverbially a e, but even we have hardly had time to forget the emonstrations of the facts we are asserting. Mr. 's proposals constitute the most gigantic interference laws of supply and demand yet attempted, and hence justification entirely convincing. The principle for e contend—no doubt incapable of immediate fruition, h we think is in danger of being lost sight of— ean that with the removal of rent restrictions the from house property would rise to a figure which ake this a profitable investment. Let us face the Unless the Government—which means the working much as anyone else—intends to saddle itself with ilding and pay rents in perpetuity, a luxury of which had some painful experience, we have got to come our principles some time.

et us examine the present proposals on the basis of an honest assumption that artificialism is inevitable. The immediate result of launching a big scheme is a general rise in prices; this we see at present as the result of the mere prospect of a Housing Bill. Mr. Wheatley meets this by taking very drastic powers to investigate costs and impose penalties. While we applaud the intention, we feel very doubtful of the success of these proposals. If we may regard the recent Profiteering Committees—of which we know something—as at all analogous to the Committees proposed, we fear that the Minister will be disappointed and the public impatient. An investigation into costs involves a great deal of evidence, which means time and money. The last has to be found from public taxation. On certain Committees suggested above as analogous, investigation, we believe, took so long that prices had appreciably altered by the time the report appeared. It is probable that unless a sufficiency of materials can be guaranteed, prices will rise, whether openly or secretly, to the level of the demand, notwithstanding these Committees, and that sums in excess of the market rate will be paid by those involved in transactions which would mean much heavier financial loss if delayed.

But we must turn to another and wider aspect of the Housing Bill which seems to have escaped Mr. Wheatley entirely, namely, its effect upon the rest of the building industry in the country, still, notwithstanding the scope of the housing scheme, much the larger part. We do not imagine that any serious attempt will be made to suggest legal restrictions on building other than housing, but the effect of the Bill is likely to be very penalising. It is easy for the street-corner politician to declare that the houses of the rich can wait, and we have no disagreement with him on this point, but what he conceals or fails to understand is that the cost of building business premises, public works and that of repairs and upkeep—a very large national item—quite apart from anything in the nature of "luxury building," will be seriously increased or made impracticable. These costs, or the costs of dislocations, will be handed on to the public in the shape of increased costs to the community on necessary purchases. Again, our schools and other educational centres—most of which have done no serious building for ten years—are crying out for expansion. Increased costs here, too, will be passed on to the taxpayer. If this patient person is to pay his thousand million, Mr. Wheatley must see to it that he can still carry on and afford to expand his buildings with expanding trade. We do not grudge the golden eggs to help those whose homes are not worthy of the name, but the number of these eggs has a limit, and if they are to be produced the necessary sustenance for their production must not be forgotten in the programme for the better housing of the workers.

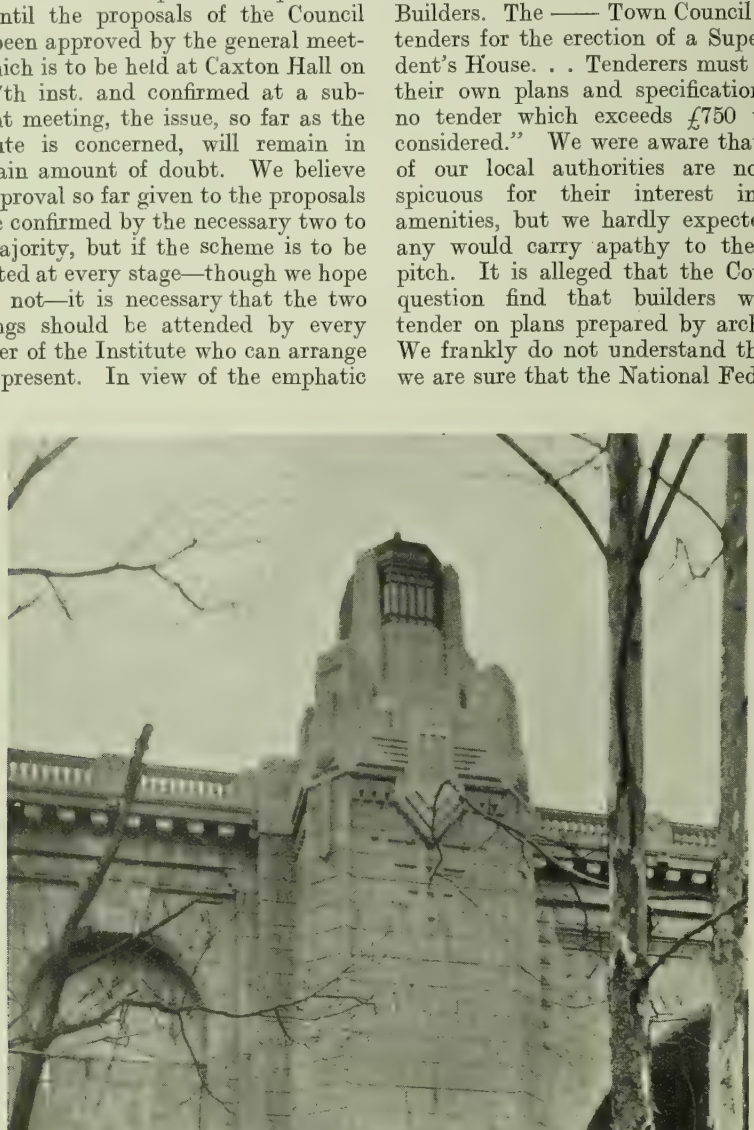
This is no case of special pleading. We might very consistently argue that the greater part of an industry (perhaps the second largest in the country) should not be placed at a serious disadvantage by the assistance given to one of its branches in distress; but we have put the matter merely as one of national policy. The State, one would almost think, some people believed to be a rich man giving donations to laudable objects. It seems absurd to have to write that the State is the taxpayer and that the great mass of the nation are the workers who contribute to taxation. Let us be sure, therefore, that we spend our money wisely, and as little of it in Whitehall as can be arranged.

NOTES

The Amalgamation Proposals.

THE emphatic endorsement at the recent Institute election of the policy of the present Council of the R.I.B.A. of amalgamation with the Society of Architects with the object of obtaining the statutory registration of architects does not dispose of the question, and until the proposals of the Council have been approved by the general meeting which is to be held at Caxton Hall on the 17th inst. and confirmed at a subsequent meeting, the issue, so far as the Institute is concerned, will remain in a certain amount of doubt. We believe the approval so far given to the proposals will be confirmed by the necessary two to one majority, but if the scheme is to be contested at every stage—though we hope it will not—it is necessary that the two meetings should be attended by every member of the Institute who can arrange to be present. In view of the emphatic expression of opinion recorded by the electorate, it is to be hoped that the proposals will not be opposed; but in any case, the fullest attendance of members is desirable at the meetings.

A New Menace.



THE following advertisement has recently appeared in a local paper in one of the Home Counties: "To Builders. The —— Town Council invites tenders for the erection of a Superintendent's House. . . Tenderers must submit their own plans and specifications, but no tender which exceeds £750 will be considered." We were aware that many of our local authorities are not conspicuous for their interest in local amenities, but we hardly expected that any would carry apathy to the above pitch. It is alleged that the Council in question find that builders will not tender on plans prepared by architects! We frankly do not understand this, and we are sure that the National Federation of House Builders would not moment allow their members t an attitude that can only bring on private enterprise and play into the hands of its enemies. upon builders designing their ow is to throw an unjustifiable burd the shoulders of the builder. that Mr. Wheatley will take not tendency, and will take every pr to protect the public from in work and to avoid the discredit be reflected upon the Governme standard of housing under his falls below that introduced Addison.

Foolish Methods.

IMMEDIATELY bel advertisement we same authority tenders for the erection of 3 which the Council proposes t "A lithographed lay-out plan and plan of one pair of the propose . . . can be obtained upon appl Here is a Council proposing eighteen pairs of houses, all to t design, although we also note th Council is also prepared to alternative tenders for the erecti houses on a modified specificatio the tenderers have the option to in which case the modifications to be made in the plan and spec must be clearly described." It hoped that local feeling will itself in time to prevent this th disaster, and that it will be ass doing so by a lead from the Mi Health. It should be incumbe all local authorities to obtain arch advice, even if the architect acts a consultative capacity.

The Hollar Memorial.

IT is well that a n of Wenceslaus Holla be placed in St. Ma Westminster, and happy arrangement that the n should take the form of the desi by George Virtue, the learned an who, in his catalogue of Hollar's in 1745, designed a tablet wh design now proposed closely Hollar was buried in the church St. Margaret's, and it is t suitable that the proposed n should be erected within that We are all so indebted to Hollar topographical views—his prints of as it was in the seventeenth and others, showing the dev caused by the Great Fire, are o ordinary interest in depicting the of that time. The cost of carry the design made by Virtue will b £120, and there are so many adm Hollar's work that there will, of be no difficulty in raising so n sum. A representative commit been formed, including the Curzon and Sir Aston Webb, t subscriptions may be sent. Ho a conscientious and indefatigable

ent itors.

It is not without interest that prominent art schools should now find a place for the work of their more sing pupils in public exhibitions, here is certainly—as pointed out art critic—no favouritism in this. past and present pupils of the my and Slade Schools should figure ently in Academy and New English lub exhibitions is, however, a able thing, and the prominence to such work is, no doubt, meant ourage the schools' interests, which, of value, are not exactly those for public exhibitions were formerly ted. In giving this prominence to ork of clever students in public tions assumed to promote the l interests of art, these exhibitions e a different character, and their to a larger representation is some- weakened. This tendency, as it ps, suggests a new valuation of exhibitions and announces what ecently been pointed out that estige of exhibitions as standing encouragement of art at its best g replaced by other objects. And , perhaps, all to the good. The a which was placed on artists' through being shown in special ions, is gradually becoming dis- ted by a larger independence of which seeks for it where it can be

A Graphic Letter by Leech.

ALTHOUGH the jocular letter by John Leech, from which the following quotation is made, was written in 1850, it has not appeared in print till now. Its introduction in this place is pertinent to the interesting remarks given on page 903 in last week's *Builder* by a correspondent to whom they were communicated about a year ago by the late H. H. Statham. He described his experience of the well-known difficulty of ensuring sympathetic renderings of architectural details by means of wood engraving which, owing to the lack of technical knowledge on the part of the engraver, was always apt to become merely mechanical. Draughtsmen of all kinds have had good reason to complain of this drawback. John Leech, the world-famed artist whose name was described "as good as the lion stamp on silver," was not exempt in this regard and tells us how he suffered badly, having invented the familiar "Briggs' series of hunting pictures" for *Punch*. He was introduced by W. M. Thackeray to Robert Smith Surtees, creator of the immortal "Jorrocks," and E. D. Cuming, the author of the memorable and popular sporting novel, "Soapy Sponge," for which book Thackeray had been invited to make the drawings. He excused himself as not having the slightest idea how to draw a horse or any sporting subject. Fortunately for all concerned, he recommended his friend Leech; and Surtees, who started *The Field*, adopted this arrangement. The method of colour printing practised in the "'fifties" left the artist to the mercy of the journeyman who cut the blocks in his own haphazard way for the printers' renderings, often producing uncertain results. It thus happened when Leech received the impressions of the plates in question and submitted them to Surtees, he wrote: "Sponge has lost the hair on the top of his head through no fault of mine. It ought to have been coloured, like the rest, a dark brown, and was to my pattern. But I assure you the colourers are troublesome customers—a green horse or a blue man would not shock them at all if they imagined that there ought to be, for the sake of variety, these colours in the picture.

Old Lych Gate at Clun, Shropshire.

GENERAL NEWS

Royal Archæological Institute.

The Summer Meeting of the Royal Archæological Institute of Great Britain and Ireland will be held at Winchester from July 16–23.

Liverpool Housing Scheme.

The Liverpool Corporation Housing Committee recently adopted a scheme for the erection of 6,000 houses on land at Walton over a square mile in extent, at an estimated cost of between £3,000,000 and £4,000,000. Mr. T. White, the chairman, said the scheme would relieve thousands of persons lacking in housing accommodation.

Architects' Estates.

Mr. John Robinson, of Park Cottage, Wombwell, near Barnsley, Yorks, architect and surveyor, net personalty £2,290, gross £30,502.

Mr. Robert Fletcher Rogerson, of Henry-street, Brighouse, Yorks, architect and surveyor, a former member of the Brighouse Town Council, net personalty £5,721, gross £8,485.

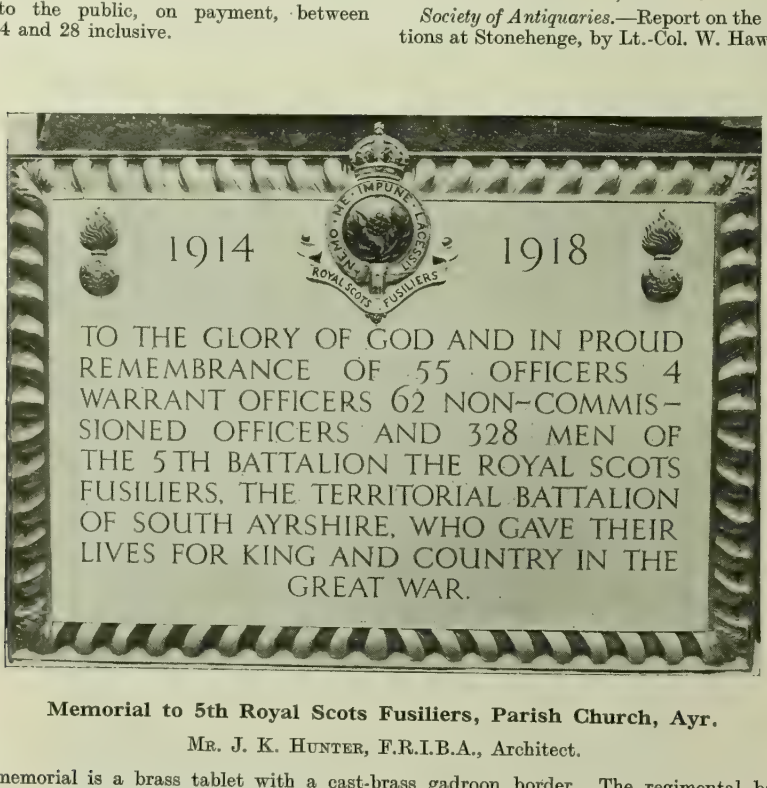
The London Building Law.

In connection with the report of the London Building Acts Committee of the R.I.B.A., a special general meeting of the Institute will be held on Monday, June 23, at 4 p.m., when Mr. Charles A. Daubney will read a paper on "The Proposed Reform of the London Building Law." A further special general meeting will be held on Monday, June 30, at 4.30 p.m., to resume the discussion on Mr. Daubney's paper and the report.

Liverpool Cathedral.

Liverpool Cathedral will be consecrated in the presence of the King on the afternoon of Saturday, July 19; and on Sunday, July 20, His Majesty has expressed a wish to attend the morning service at the Cathedral (during this service the special War Memorial Transept will be dedicated). In addition to the above ceremonies, the Cathedral will be open to the public, on payment, between June 24 and 28 inclusive.

Interior of Old Parish Church, Ayr, showing War Memorial.



MEETINGS

TUESDAY, *June* 17.

Royal Institute of British Architects.—Meeting to consider provisional agreement between the R.I.B.A. and the Society of Architects. At Caxton Hall, S.W. 1. 3 p.m.

THURSDAY, *June* 19.

Society of Antiquaries.—Report on the excavations at Stonehenge, by Lt.-Col. W. Hawley.

Memorial to 5th Royal Scots Fusiliers, Parish Church, Ayr.

MR. J. K. HUNTER, F.R.I.B.A., Architect.

[This memorial is a brass tablet with a cast-brass gadroon border. The regimental badge in cast brass, relieved with colours, and two reproductions of the "Grenade" cap badges, are the only other features on the simple plate. The memorial was made by Messrs. H. H. Martyn & Co., Ltd., Cheltenham. The general view of the interior is interesting as being of the church built by aid of a grant from Oliver Cromwell, in lieu of the parish church of St. John which he at that time—1654—had enclosed within the walls of his great fortress of Ayr lying to the west of the town and commanding the harbour and its approach from the sea.]

COMPETITION NE

Glasgow High School Memorial.

Competitive designs are invited for a m club house and pavilion to be erected ground of the Glasgow High School Anniesland, Glasgow. The competition fined to former pupils of the High Sc Glasgow. Premiums of £150, £100 a are offered respectively. Mr. John F.R.I.B.A., Glasgow, has been appoint sessor. Sending-in day, Sept. 30. Part and plans may be obtained from Mr. Buchanan, 172, St. Vincent-street, G (See advertisement this week.)

Masonic Memorial.

Designs for rebuilding Freemasons' Great Queen-street, Kingsway. The petition to be conducted in two stages. of the architects submitting a design final competition will receive an hono of £500. Assessors, Sir Edwin Lutyen Walter Cave, Mr. A. Burnett Brown. On of one guinea competitors will receive tions of the competition, which has t proval of the R.I.B.A., together with plan of site.

Applications marked "M. M. M. Compe must be received by The Grand Sec Freemasons' Hall, Great Queen-street, L not later than August 23. (See adverti this week.)

School at Holbrook.

We are informed that of the list of app to compete in the competition for desi the proposed new Royal Hospital Sch Holbrook, near Ipswich, six architect been requested to send in designs to the D of Greenwich Hospital by December 1.

Other Competitions.

Other competitions still open inclu following (the dates given are, first the s in date, and second the issue of *The Bu* which full particulars were given):—Inc **Designs (June; Dec. 21, 1923). Ross Memorial (Sept. 30; Feb. 21). Glasgow Hall (July 4; May 2). Harrogate Inf (Sept. 30; May 30). Bexhill Enterta Hall (Sept. 1; May 30). Hamilton Memorial (Sept. 1; May 30).**

LDING AND DESIGN IN THE FUTURE

By J. HEMBROW

of us have realised that with the increasing cost of labour and materials mprovement or simplification of the methods of building will be forced upon t probably if labour were to remain he developments would still take place, h they might proceed more slowly. It o say that compared with shipbuilding, uilding, electrical engineering, and other dustries the art of building is backward ; still in a large measure doing as we have r centuries. We have not the scientific es of our friends in the industries or if we have we do not use them. tense conservatism of the architect e reaches years of maturity is the likely tion of this startling fact. But even he architect is of that hopeless mental which asserts that as in forty years' nce a certain way was found best a must not be contemplated, he will have home to him the fact that his having e thing one way for forty years is a sure at it is time it should be done differently. is something wrong with an industry cannot produce houses even for its own s at a rent they can afford to pay. The n will probably be found when we are to utilise labour, as we soon may be, in way that more cube is produced in a given of time, and this will inevitably affect The inventive mind is already moving direction, and reinforced concrete may me into its own, whilst the unit of other ls of construction will have to be in-

-concrete has many advantages in this on, and in addition allows us greater floor for the same strength. This is a con-le merit where ground rents are high, re tall buildings are built. How many ave really considered this comparatively edium with the seriousness it deserves ? l objection of our youth that "the world t enough experience of it" has no force nen with more courage have answered practical way. We have remarked the ing beauty or (out of respect for our ative friends) the diminution of ugliness reinforced concrete structure. Some of uctures have already attained a beauty own. As our knowledge of the medium es and it is more broadly adopted, it doubtedly affect design profoundly, if a riod in design or an almost entirely le is not evolved. Our present façades ll the outcome of our "ringing the " on lintel and arch, while it has never ie good fortune of any previous genera- have ready to its hand a material which itself available for tension as well as and torsion. Their buildings had to be ents of stone or brick for compression s, steel or wood and iron for tension, reinforced concrete we have a material tic as clay, as hard as stone, with the y for tension added. It is surely some- o dream of when we consider the new hich will insinuate themselves inevitably r buildings as our use of this material We shall perhaps be able to dispense at deception, the modern stone front, s merely a curtain of sham respectability ver the crude hideousness of steel, and in the same way, as when students in e hung a coloured curtain over a packing make our friends thing we possessed ng respectable to sit on.

we have an inheritance of the ages of the form of bricks as a building unit, those of us who love beauty for beauty's e Belgian brick, which is a still smaller This method of building will go by the ith time, except for special work. With of labour added to costliness it is ically unsound to construct a wall in such a laborious way. Habit and lethargy have mitigated against the adoption of a method more in keeping with the twentieth century, but it is mostly sheer laziness which has left the many clever methods which are being devised and improved every day to the enthusiasm and self-sacrifice of a few.

One of the most ingenious of these methods was devised by a steel casement manufacturer and used in the housing of his own men—a practical contribution to constructive thought whether we agree with his method or not. It was a method of units, as the present method we use for buildings is, *i.e.*, we measure or gauge everything by the brick. The unit used by this gentleman was simply a much larger one ; not so large as to be unwieldly nor so coarse as to restrict design, but one which would allow of quicker walling, quicker flooring, and greater general speed than building in brick will permit.

In the course of time, when the pioneer has worked and suffered his little life away, we shall come down magnanimously as a profession and adopt some such sane and feasible system as this and remain for ever blest except for our consciousness that we ought to have been more equal to the calls of the time upon us when this need first arose and the real distress created by it was more manifest.

I have said elsewhere that design at the moment is transitional. It shows all the restless unhappiness of self-consciousness and the realisation of its shortcomings with a desperate sense of its own sincerity. It is already apparent to the thoughtful that form is changing and that the older order is losing ground, as the old always will, in the battle against the new and vigorous. There is already one concrete façade in the heart of the West End of London ; there will be many more. There are already demonstrable contributions to more economical methods of building. This generation may not see revolutionary changes, but the change is gradually taking place now. If we could live a hundred years we should hear at the dinner table (if they have dinners) the conversational young man of mildly intellectual tendencies saying something like this of our times : "I cannot understand how the generations which developed the now obsolete steam engine, the internal combustion engine, the telephone, the telegraph, the phonograph, the cinematograph, and that crude but truly marvellous (to them) form of utilising the ether waves which they quaintly termed 'wireless,' could have been satisfied as they were to employ hundreds of men to put little bits of burnt clay side by side and one on t'other when they set out to construct a tower two hundred odd feet high."

YORK MINSTER GLASS

The Very Rev. the Dean of York recently presided over the annual meeting of the Minster Windows Preservations Fund Committee. In the course of his address he said there was no treatment of their glass more drastic than its immersion in a specially prepared bath of warm water. There was no soda or chemical in the water ; there was no hard implement employed in the cleaning of the glass. It was allowed to lie and soak in warm water. He could testify—and those who went occasionally into the shops could testify—to the delicacy and care with which the individual pieces of glass were finally treated by their workmen. He failed entirely to understand what Mr. Heaton was referring to at a recent meeting of the London Society of Glass Technology when he said the treatment was too drastic. There was no drastice treatment. Mr. Heaton was on the committee of five experts, and he (the Dean) would be only too willing to listen to anything he had to say in the way of advice, and to follow it if at all possible in reducing what he had described as drastic treatment of their glass, but honestly he did not know what was meant.

The Five Sisters Window was being preserved as a memorial to the women of the county who sacrificed their lives in the war. It was proposed to erect an oak screen in the north side of Saint Nicholas Chapel, the screen to be finely gilded and decorated on the top, and the lower part would be of panelled oak, the panels of which would open. The names of 1,400 women would be written inside the panels, so that when the screen was closed it would be just an oak screen, and the only things to be seen would be the various badges of the units in which women served.

It was reported that since May of last year seven north choir clerestory windows had been taken in hand, and five of them had been relaid. The stonework and tracery of five had been removed, and three had been restored and refixed. The old glass in the Five Sisters Window had been removed, 30 panels had been releaded, three were now in hand, and 37 had to be taken in hand. The total number of windows completed since November, 1918, was 28. The number releaded was 31, and there were yet 41 windows to be taken in hand.

York and East Yorkshire Architectural Society.

The members of the York and East Yorkshire Architectural Society recently paid a visit to Helmsley Castle, Rievaulx and Byland Abbeys. H.M. Office of Works, in whose hands the task of restoration has been entrusted, placed at the Society's disposal means by which the work could be inspected. Though the work in places is being repaired and strengthened by the insertion of reinforcements which cannot be detected, none of the feeling of consecratedness imparted by the original craftsmen is, it is stated, being violated.

Thirteenth-Century Church at Burrowbridge, Somerset.

[It is stated that the last service held in this church, which it is proposed to restore, took place in 1426.]

CORRESPONDENCE

Housing Costs.

SIR,—We beg to address you upon the subject of housing, so important in the eyes of Parliament and everyone. The present solution, gathered from the newspaper reports of the discussions in the House, which the Government favours, means the expenditure of colossal sums taken by taxation, and leaving still less for general productive business.

The scheme is an average gift of £11 per house per annum for forty years. For every 100,000 houses this means £1,100,000 per annum. The country cannot bear this outlay, considering two million houses are named as required. As there seems to us to be a means of obtaining the houses without this ruinous gift of capital, we ask to put our views before you.

In the country a good parlour house, with three bedrooms, would cost to-day £500 inclusive of drainage, interest on capital during construction, &c., and the net financial result would work out as follows :—

CAPITAL EXPENDITURE PER HOUSE.

Cost of erection	£500 0

Revenue Account.

	£ s.		£ s.
To Ground Rent	10	By Subsidy	11 0
,, Insurance ..	6	,, Rentals (12s. 6d. per week)	32 10
,, Repairs, &c.	2 10		
,, Management	14		
,, Reduced Rates ..	2 0		
	£6 0		43 10
		Less Costs	6 0
Balance per house per annum ..			£37 10

The net return of £37 10s. gives 7½ per cent. return on the expenditure, but only as the result of loss to the community of £11 per house per annum, a most non-economic position.

What we think is a better and an economic method is that instead of this gift of capital the same result be obtainable by lending the money as a mortgage *at a low rate of interest*. The Government borrows money at Short Call at a rate at which it could lend at below 4 per cent. without loss. At 4 per cent. there would be a margin to meet even the expense of book-keeping. The money could be lent at 4 per cent. not only without loss, but redeemable, so that there would be no charge and no loss on the transaction. It would cost the nation nothing, and the private builder can be trusted to erect as many houses as needed, or as many as there are workmen and material available for. This latter condition, of course, applies equally in any proposition. The financial result would, on similar lines to the foregoing, work out somewhat as follows :—

CAPITAL EXPENDITURE PER HOUSE.

Cost of erection	£500 0

Revenue Account.

	£ s.		£ s.
To Outgoings as before ..	6 0	By Rentals (12s. 6d. per week)	32 10
,, 80 per cent. of the £500 on Loan, namely £400 at 4 per cent. per annum ..	16 0		
,, Redemption (40 years) ..	3 7		
	£25 7		32 10
		Less Cost ..	25 7
Balance per house per annum ..			£7 3

The net return of £7 3s. gives 7 per cent. return on the £100 expenditure, and without loss or cost to the community—an economic position.

In any proposal, the question of rates will arise. If the local authorities are willing to pay, as stated, from £3 to £4 10s. per house per annum in Mr. Wheatley's method, they would very willingly agree instead to a simple rebate in the rates. In our calculations we have included £2 per house towards the rates.

As it seems to us to be sound reasoning, we beg to lay our suggestion before you for your consideration.

CHAS. HEATHCOTE & SONS.

"Damages Against Lessor."

SIR,—With reference to your "Notes on Current Cases" on page 878 of your issue of May 30.

May I point out that your commentator refers to the High Court case of Calthorpe *v.* McOscar (1923 K.B.) at some length, but entirely omits to make any reference of any kind to the fact that the judgment delivered in the Court of Appeal, December 14, 1923, entirely reversed the judgment of Mr. Justice McCardie ?

This omission on the part of your commentator is obviously an oversight, but his failure to note the judgment of Lords Justices Bankes, Scrutton and Atkin gives quite an erroneous impression to the uninitiated of the present state of the law in this matter (see also Morgan *v.* Hardy, L.R., 17 Q.B.D., 770).

It is important also to note that this d of the Appeal Judges has relegated the quoted case of Proudfoot *v.* Hart to its position.

Lord Justice Bankes said, as regards Pro *v.* Hart, that "what the Court were deali in this case, and all they were dealing wi a three years' agreement for a tenancy, it case the class of tenant at the end of the t was, in the Court's view, no doubt the sam of tenant as at the commencement."

ARTHUR H. D

[We have also received a letter from M Tyler, F.S.I., raising the same point.

Our legal contributor writes as follo

"The writer of the note on Hewitt lands expresses his acknowledgments correspondents who have drawn atten the fact that the case of Calthorpe *v.* M which he incidentally referred to in tha has been reversed on appeal.

"That appeal was not reported, so he can find, in the *Weekly Notes*, nor inserted in the daily record of business Court which appears every week in the *Notes*, but the appeal is fully reported the 'Law Reports,' which were pu a week after his note was published *Builder*.

"By a curious coincidence, that case, *v.* Rowlands, was also the subject of and a report of the decision appeared after the above note was published, theref whole subject will be reviewed in a 'Legal Section.'"]

Long-Span Arches.

SIR,—In your correspondence colu January this year, Mr. A. Henthorn protested against the proposal to b reinforced concrete bridge across the Straits in place of Telford's bridge, whi now become unsafe and is not wide for modern requirements, and stated reinforced concrete bridge was "impracti owing to the width and height (550 100 ft.) required for the navigation Straits.

I now enclose a photograph of a rei concrete bridge at present in course of e in France, the arches of which have span of 590 ft. 6 in., or 40 ft. in excess o Mr. Stott states to be necessary at This bridge is fully illustrated and de in the June issue of "Concrete and Co tional Engineering." I hope this will co Mr. Stott that a concrete bridge acro Menai Straits would be quite practicable

Reinforced Concrete Bridge with Arches of 590 ft. 6 in. span, at Elorn, France. (*See Letter on this page.*)

STREET ARCHITECTURE—VII.

By V. M. CHRISTY.

BROAD-STREET.

OAD-STREET in its present condition is one ose unfortunate streets that form a link een others, rather than possessing any very ed individuality or purpose of their own. rmer days it was an important thorough- giving its name to a Ward and lined with al important buildings of different kinds, as a city company's hall, the back of Sir ıas Gresham's mansion, and the approach e church of the Augustinian Friars, which " in the year 1550 granted to the Dutch ɔn in London, to be their preaching place," so remains to this day. To the north er of "Brode Street," in the time of Stow, ıed the great house and garden of Sir am Powlet, built on the site of the friars' e, cloisters and garden, while not far away the fine dwelling built by Thomas Cromwell, ıe unscrupulous methods of enlarging his en are so graphically described by the son ıe of his victims : " My father had a garden e, and a house standing close to his south ; this house they loosed from the groun.a, bare upon rollers into my father's garden ıty-two feet, ere my father heard thereof ; warning was given him nor other answer, n he spake to the surveyors of that work, that their master Sir Thomas commanded ı so to do ; no man durst argue the matter each man lost his land, and my father paid whole rent, which was 6s. 6d. the year, for half which was left." One wonders what ing the Rent Restriction Act would have n such a case !

ne great point about the modern street, ch was probably lacking in its earlier days, ıe impression of onward flow which is given the sweeping lines of blocks occupying the where the street curves towards the Royal hange. There is a continuity about these ks which contrasts with the more detached acter of others in the straighter parts of street. Two questions, however, seem to uggested by certain buildings in this part : is the question whether sm.ll-paned case- t windows do not strike too rural a note n used in an important modern London street point commented on in a previous article ussing Piccadilly ; the other, is it wisdom or isdom to employ square-edged, projecting ks of stone set in curves on plan, which, ough doubtless adding a note of originality something out of the ordinary, may easily t to a sense of restlessness and indecision ? ad-street is full of contrasts. There are very " English " older insurance companies' dings, which are solid, uncompromising, perhaps a trifle gloomy. The recent corating of their exteriors has given them airer chance among their more youthful hbours, and now that it is more possible ive them their due it is seen that their chief ıe is proportion. They have no pretensions rettiness, but they have dignity and good ding, combined perhaps with a slight pom- ty.

ıese mid-nineteenth-century buildings are a sant contrast to others not far away, some- t their juniors, which are restlessly over- ned. Sculpture on them runs riot. There much carving in the details that one finds ulty in distinguishing the main outlines of floral, human, or animal forms represented. wood is concealed by the trees. There are ıany scales on the dolphins that their heads lost among them ; so much beard and hair he head of the sea-god or man, that he may like a star-fish or a house on fire, according ıe angle from which the eye is caught ; and niceties of distinction are lost between the ned head and the sadly surprised Pan, or tever the fantastic portraiture represents. e are too few broad plain lines to give a ful link between different portions of the ration ; no stepping-stones from one to the r to give definite foothold in this confusing lpool. And this cumbersome and florid effect is the result of a well-meant effort after sprightliness.

About midway between these two strikingly contrasted parts of Broad-street the new Gresham House has by now securely established itself. This new building sums up certain characteristics of the two groups already mentioned, and presents its own conception of how the aims of both might be attained at one throw. There is a certain rather cold dignity about it, akin to the dignity of the painted smooth-fronted insurance buildings, although this dignity is attained by the modern method of plate-glass rigidity reflected in stonework. Like the older buildings this new one successfully avoids fussiness and floridness ; it accepts, nevertheless, the challenge of its other neighbours to the attainment of decorative effect. It achieves the latter by restrained methods which leave it light and well-balanced, instead of by protuberances and fussy detail. The three attics in receding stages, and the cornice supported on console brackets above the capitals, give distinctive individuality ; the solid lines upon which the upper part rests give anchorage. The impression of "anchorage" is given, in the case of the insurance buildings, by their block-like solidity with their few and regularly-spaced voids ; in the case of the Victorian shops and offices by the super-imposed sculpture, which somewhat suggests weights suspended from the awning of a street stall in windy weather. There is nothing frivolous about the new Gresham House, yet it contrives to be sprightly where others fail by over-striving after adornment ; there is nothing dour or gloomy about it, yet it has dignity such as many miss by taking life too seriously. It is a not unworthy distant successor to the mansion and the " eight proper alms-houses built of brick and timber by Sir Thomas Gresham, knight," whose name is very properly brought to mind by the plaque let into the wall.

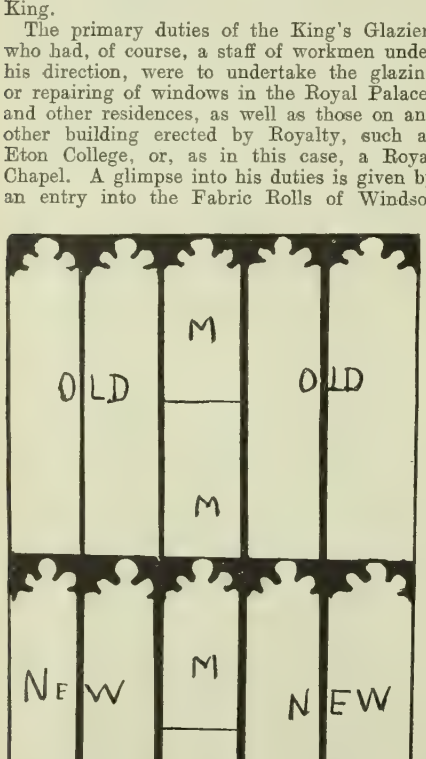
The few yards of backwater-street to which the name of New Broad-street is usually alone applied is rather forlorn. It is a sort of waif belonging to no one in particular. It is actually almost as distinct a street as Wormwood-street nearly opposite, except that it is not a thoroughfare for vehicles, and yet it is given no name of its own while many a less distinguished court or passage has a special title. In the few yards covered by this almost cul-de-sac there is an extraordinary variety of buildings, showing what a diversity of architectural ideas was current and carried into effect during the early years of the present century. It seems typical of the curious restlessness and experimentalism in art prevalent at that time. It may be argued perhaps that restlessness and experimentalism are even more characteristic of the present decade, when Georgian brickwork springs up side by side with pseudo-Assyrian, when Doric friezes rub shoulders with Edwardian casements. But the more recent buildings have a more confident air ; they are not quite so tentative, though critics may sometimes feel that tentativeness rather than confidence would be more becoming in them. In that angle piece of New Broad-street one meets with Victorian Gothic next to twentieth-century classic-baroque, with its curves and strange angles ; a quieter, more severe façade, with somewhat meaningless swags of fruit tucked away in the most shadowed parts, a frankly " original " *mêlange* of Egyptian, Louis Quatorze and Doric ; then an imitation of early Georgian country-town architecture. Of these the last is too much in fancy dress to hold its position with real dignity in the City of London. Parts of it are almost as incongruous as a country farmer J.P. would be who brought a pig and a shot gun with him on a visit to London. In the real eighteen-hundreds the farmer or the provincial merchant would even make a few changes in his costume if he desired to mix harmoniously with his metropolitan confrères. Bottle glass cannot appropriately jostle plate glass in the latter's domain when the two are contemporary productions, though Staple Inn is able to hold its own against them both. The building in question is self-conscious because it is wearing an archaic veneer. The one opposite seems rather like a specimen case displaying various kinds of ornament used at distinct phases of architectural history. The gorge moulding is there, though shorn of its reeding and colour ; a French chateau window, and a doorway from somewhere else, while the pervading flavour is that of the land of the Pharaohs, represented by lotuses, religious symbols and sphinxes, interspersed with a relish of egg and dart. There is nothing vulgar or aggressive about it, but it is a trifle like the boy who does not know the answer to the question set in his examination and, therefore answers questions that were not set.

Reinforced Concrete Shop Front at Barcelona.

It seems almost a pity that the strikingly severe new building in Wormwood-street cannot be removed to this place, where the greater space and the absence of traffic would give the passer-by a chance of judging its merits without the bodily danger and contortions involved in endeavouring to do so where it stands. Some of our streets are becoming semi-tunnels, and tunnel-architecture to be appreciated as street architecture at all must be treated differently from architecture in streets that are " broad." Short of turning narrow streets with high modern buildings into true tunnels by means of concave façades, perhaps the solution of the problem lies in more particularly designing the lower portion of buildings in such positions so as to form a complete unit when regarded from street—or vehicle—level and yet to be an integral part of the whole when the façade can be seen *in toto* in the architect's drawings or when the street is widened. In tunnel-streets the whole façade is seldom easily seen ; in our " Broad-streets " the aspect of the whole rather than of the parts is what the man-in-the-street is able to take in. A design which may be excellent in a tunnel-street may produce a piecemeal effect in a Broad-street, yet we are slow to perceive small differences which mean so much, and still slower to act upon them.

FURTHER NOTES ON THE GLAZING OF KING HENRY VII CHAPEL, WESTMINSTER ABBEY

MR. J. D. LE COUTEUR writes:—



In the course of his most interesting and valuable notes on the glazing of Henry VII's Chapel in Westminster Abbey, which appeared in *The Builder* for May 9, Professor Lethaby raises several points which call for further comment.

He quotes Dr. M. R. James as saying that Barnard Flower, the King's Glazier, died in 1525 or 1526. But it has recently been ascertained (see "H. C." in *Notes and Queries* for October, 1917) that "Barnard Flower, the Kinge's Glasyer of England," really died in 1517, between July 25, the date of his Will, and August 14, the day on which probate of the Will was granted at Lambeth.

He was, moreover, not an Englishman, but a German, "a native of Almaine" who had been granted letters of denization on May 6, 1514, by King Henry VIII, and who had held the office of "King's Glazier" for several years previous to that date.

The post of King's Glazier was of some importance in the Middle Ages, the recipient holding it for life, unless a change took place in the Royal Succession. A predecessor of Barnard Flower's, one John Prudde (who held that office from his appointment in 1440 till the death of King Henry VI in 1461, when he was superseded by Thomas Bye, citizen and glazier of London), received "such fees and wages as Roger Gloucester held, by the hands of the Clerk of the Works, and all other appurtenants, profits, and a shedde' called the 'Glasier's logge' in the westernmost part within Westminster Palace, and a gown of the King's livery, of the suit of the sergeant of the works, yearly at Christmas." He also received the sum of 12d. per day by special grant of the King.

The primary duties of the King's Glazier, who had, of course, a staff of workmen under his direction, were to undertake the glazing or repairing of windows in the Royal Palaces and other residences, as well as those on any other building erected by Royalty, such as Eton College, or, as in this case, a Royal Chapel. A glimpse into his duties is given by an entry into the Fabric Rolls of Windsor Castle for the year 1533, where a payment of 8d. is recorded as made to "Rychard Hyll of Wyndsore ffor hys horse to London to fett Galyan the Kinge's Glasyer (Flower's successor), against the Kinge's coming to Wyndsore."

PLAN I.—ARRANGEMENT OF A WINDOW AT KING'S COLLEGE CHAPEL, CAMBRIDGE: MAIN LIGHTS ONLY SHOWN.

There was therefore every reason why Flower and his men should be employed upon the glazing of Henry VII Chapel, and, when ready, upon the window of King's College Chapel also. His death in 1517 brought the work of glazing King's College Chapel with coloured glass to a standstill, for it was not until 1526 that Galyan Hone, a Fleming who had succeeded as King's Glasyer, on his death in 1517, was set to work upon the task; whilst doubtless to prevent further unnecessary delay a number of other firms were allowed to share in the work.

Professor Lethaby's second point, that the ancient glazing of King Henry VII's Chapel corresponded entirely with the King's College scheme, is more open to question. He has overlooked one important detail, namely, the arrangement of the lights themselves; for whilst the King's College windows are all of five lights divided into two tiers by a transom, those in the clerestories of Henry VII's Chapel, though of five lights also, are divided into *three* tiers. It is impossible, therefore, that the arrangement of the two series of pictures can have been identical; indeed, it is difficult to understand exactly how the Westminster series was arranged.

It should be explained that these Old and New Testament subjects, arranged as type and anti-type, were copied from the picture bibles, and other such works. They were really elaborate pictorial commentaries upon the life of Christ. They usually consisted of one Gospel incident placed between two Old Testament types, and rarely contained more than three pictures in one group.

In the case of the King's College Chapel series the pictures dealing with this subject—"The Olde Lawe and the Newe," as it was generally called—are arranged four in a window, two above and two below the transom, the Gospel scene being below, with one Old Testament type only, set immediately above, in the upper tier. Each picture occupies two lights. The four "messengers" with their explanatory scrolls, one for each scene, occupy the central light from top to bottom, the general scheme of a window being that shown in Plan I.

It is difficult to see how this arrangement could be carried out in a three-tiered window, such as those in the clerestories of Henry VII's Chapel, where the lights, moreover, are very much smaller in size than those at King's. A picture confined to two lights only would be quite unintelligible from the ground level, whilst the "messengers" would have to be cut down to half-length. The most probable arrangement here would be to make each scene occupy four lights of a given row, the "messenger" with his explanatory scroll being placed at the extreme left or right. In that case the Gospel scene would fill the central row, the two Old Testament parallels being placed above and below. The window depicting the Crucifixion probably contained (as at King's College) no "messengers" at all (see Plan II).

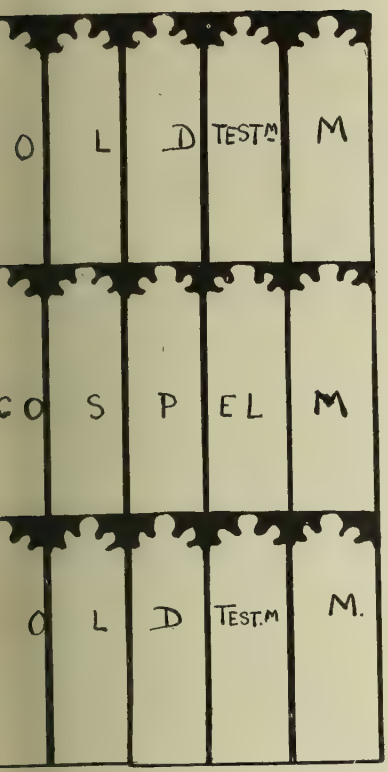
Professor Lethaby's further suggestion that the figure of the prophet Jeremiah now in the east window has a "messenger" is not borne out by the evidence afforded by the glass itself, especially by the lettering on the scroll.

As already noted, the duty of the "messengers" in the central lights of the King's College Chapel windows is to explain by means of the inscriptions painted in black letter upon their scrolls, the various incidents illustrated in the lights on either side of them. But the inscription "Patre(m) laudate nomen domin(i)," on the scroll held by the pr Jeremiah, explains nothing. It is not a complete sentence, being apparently a p up of two such inscriptions. The "Patre(m)" may be original, being the mencement of the passage usually held by prophet—"*Patrem* invocabitis qui fea conditit coelos" (You shall call me Fat Who made and built the Heavens). This the Old Testament parallel to the first c of the Apostles' Creed held by St. Peter in series of Apostles and Prophets. "Cred Deum Patrem omnipotentem creatorem et terrae" (I believe in God the F Almighty, Maker of Heaven and Earth).

This, taken in conjunction with the cut-c condition of the figure itself, now minus its feet and the tesselated pavement whe it once stood (compare Fairford), stro suggests that this figure, together with smaller angel beneath, came from a l opening, namely, one of those in the (west window of the chapel. These, it be noted, are somewhat taller than thos the clerestories, and as Professor Let points out, did once contain tiers of fig under canopies on red or blue grounds.

Assuming this to be the case, we may te tively suggest that the figures in the window included twelve Old Testa prophets, each with a scroll inscribed some passage from his individual writi the Twelve Apostles with their Creed tences; and perhaps some of the Nine Or of Angels, bearing scrolls with exhorta sentences, such as "O Angeli laudate no domini" (Angels praise ye the name of Lord).

In regard to the heraldry once displaye the side windows, it is perhaps worthy o mark to point out that the windows of John's Chapel in the Tower of London retain one or two shields and badges, inclu the hawthorn bush, identical in date an treatment with those in King Henry V Chapel, and, like them, part of the decora painted and set up by Barnard Flower at King's command.



We have submitted this letter to Profe Lethaby, who writes:—

"I have read Mr. Le Couteur's notes w the greatest interest as a real contributio our knowledge of Westminster. I believe difference between the three tiers of light Westminster and the two at Cambridge mentioned; it was in my mind, but as I not a complete solution to offer I did emphasize it, the general agreement of schemes was all I hoped to bring out. I not appreciated the difference betw "Messengers" and Prophets, and the s gestion that the figure of Jeremiah may one of a set from the west window appear me admirable. My sketch of the figure very hastily made, but the inscription seem fit very well, and the lettering must h come from it, or a similar scroll. I c consider Mr. Le Couteur's suggestions c fully as opportunity offers, and hope if a thing further occurs to him he will put it record.

"W. R. LETHABY.

Glasgow Synagogue.

Ground has now been secured for the erect on a site in Lochleven-road, Langside, Glasg adjoining that of the Battlefield Parish Chu of a synagogue and class-rooms for the Que Park Hebrew congregation, and the plans the building are awaiting the approval of Dean of Guild Court. The proposed new bu ing has been designed by Mr. Ninian Macwh nell, F.R.I.B.A. It is planned on the Orie axis, with the east end facing Lochleven-ro In style the building will be Romanesque, the material employed will be artificial to stone.

II.—SUGGESTED ARRANGEMENT OF A CLERESTORY WINDOW IN HENRY VII'S CHAPEL: MAIN LIGHTS ONLY SHOWN.

THE R.I.B.A.

IE International Congress on Architectural ation will take place at 9, Conduit-street, July 28 to August 2. The following pro- me has been arranged :—

nday, July 28.—In the evening, at the B.A., there will be a reception by the dent and Council R.I.B.A.

esday, July 29.—In the morning there will meeting of the members at the R.I.B.A., papers on Architectural Education in ast in America, France, Italy, and England be read and discussed. In the afternoon nembers will assemble at the Architectural iation, 34, Bedford-square, W.C., for a visit School of Architecture, and proceed thence visit to the Bartlett School of Architecture.

dnesday, July 30.—In the morning, s on Architectural Education at the Present in America, France, Italy, and England be read and discussed. In the afternoon bers will embark on a launch at Lambeth, roceed to Greenwich.

ursday, July 31.—In the morning, members meet at the R.I.B.A., when papers on tectural Education in the Future in ica, France, Italy, and England will be and discussed. In the afternoon a visit be paid to the British Empire Exhibition Vembley. In the evening the Congress uet will take place at the Hotel Victoria.

day, August 1.—Visit to Cambridge.

urday, August 2.—The following conducted have been arranged : Westminster Abbey, ofessor W. R. Lethaby ; St. Paul's Cathe- by Mr. Mervyn Macartney ; the City hes, by Mr. Arthur Keen and Mr. Arthur on ; and the British Museum, by Sir John et.

Registration.

e poll of Licentiates on the Council's sals for the Registration and Consolidation e profession has been completed ; 881 s have been received. Of these 859 are our and 22 against.

The President.

e Honorary Degree of Master of Arts of University of Oxford will be conferred the President of the Royal Institute of h Architects, Mr. J. A. Gotch, on June 19.

ANCIENT MONUMENTS SOCIETY

THE first public meeting of the Ancient Monuments Society (a society for the study and conservation of Ancient Monuments and Craftsmanship in the north-western counties of England and North Wales, which was inaugurated in January, at Lancaster), was held recently at the John Rylands Library, Manchester, when the chair was taken by Sir Henry A. Miers (the Vice-Chancellor at the Manchester University). After describing the objects and outlining the proposed work of the new Society, the Chairman called on Professor T. F. Tout, who delivered an address on the study and conservation of Ancient Monuments and Craftsmanship. The meeting was attended by well-known antiquaries and others, representing all parts of the north-western counties of England and North Wales. The area to be protected by the Society has so far been limited to Cumberland, Westmorland, Lancashire, Cheshire, Derbyshire, Staffordshire, Shropshire, Flintshire, Denbighshire, Carnarvonshire, and Anglesey.

Professor Tout commenced his address by xpressing his reluctance to take part in the formation of new societies. The multiplication of societies was, he considered, one of the curses of modern civilisation. Yet he realised that good might sometimes come out of evil. In this case, after careful consideration, he felt that such evil as there might be in forming this Society would be amply compensated for by the great good that it was possible for it to achieve, and he wished it to be understood that he had come to express his goodwill and to most heartily bless the movement. Ancient monuments, said Professor Tout, would soon be almost extinct, and, undoubtedly, this Society would have been infinitely more useful if it could have been formed eighty or one hundred years ago. During that time many of their best ancient monuments had been demolished or rebuilt. Under the pretext of restoration, alterations had been made so extensively that very few of our ancient churches retained their original character and interest. Though he was personally a mediævalist, he did not merely plead for the conservation of mediæval remains, for he believed that monuments of later periods were of great interest and should be preserved with all possible care. It was often thought that architectural and archæological organisations were the proper bodies to deal with these matters, but whilst these bodies had been in existence for a long time and had done good work in their own respective spheres, he did not feel that they had safeguarded historical monuments in the way that an independent society devoted to that service could do. Many of the archæological societies had suffered owing to lack of funds, but in the case of the architectural societies the position was different. Their business was not principally to preserve old buildings, but rather to replace them with new ones. Now architects were making an honest and he hoped a successful effort to build in their own way and not to continue the facile processes of earlier generations. Architects had been too long disposed to consider that the right way to build was to copy old buildings—a method which had resulted in modern architecture being nothing but a series of replicas. An architect should not be a copyist ; he should not reproduce but create. There was in London a Society for the Protection of Ancient Buildings, but it had to cover a very large area, and he for one did not believe in undue centralisation. He always felt that, owing to centralisation in London, the provinces had a very small share of the benefits received. It was thought by some that the State should be responsible for the protection of ancient buildings, but they would be astonished to find how very limited the powers of the State were in dealing with matters of that kind. From half to two-thirds of the buildings worthy of preservation were altogether beyond the province of the State. It was also believed that the Church was in a measure responsible, but even in that case co-operation from without should be helpful. For these and other reasons he had come to the firm conclusion that the formation of this Society was essential in order to secure the better preservation of ancient monuments. He called attention to the minor antiquities, each of which might be thought in itself to be a matter of minor importance, but which, when considered together and collectively, meant so much. He pleaded that one style of architecture should not be considered more sacred than another, and pointed out that each type of building played its part, and that each tended to add interest and to diversify the monotony of modern life.

A vote of thanks to Professor Tout was moved by Mr. A. R. Powys, the Secretary of the Society for the Protection of Ancient Buildings, on behalf of that organisation. He welcomed the formation of the new Society. His committee agreed with Professor Tout that undue centralisation was by no means desirable. They felt that their position in the country would be greatly strengthened by the formation of additional societies of this kind to co-operate with them. Buildings he felt must be regarded as a record of the state of civilisation, and as a means whereby they could think of the beings who were responsible for their erection. He called attention to the humanity that they found speaking in the ancient buildings. He felt that a great work lay before the new Society if it would daily seek to spread the desire to preserve ancient buildings and not merely reserve itself for occasional efforts at times of crisis. The Society for the Protection of Ancient Buildings had from the first accepted the doctrine of Morris, which was based upon his desire to prevent the demolition of Ancient Buildings. In conclusion, he suggested various ways in which the Society might be able to make itself helpful to the community.

The vote of thanks was seconded by Councillor Walter Flinn, of Manchester, who referred to a number of local movements to prevent the destruction of ancient monuments in the district.

On the motion of Dr. Henry Guppy, Librarian of the John Rylands Library, seconded by Dr. F. C. Larkin, of Liverpool, a form of Constitution was adopted. Recommendations for the appointment of an advisory committee were then made by Alderman Arthur Bennett, of Warrington. These were seconded by Dr. A. A. Mumford, and adopted. The Council of the new Society was then appointed. Mr. Edward Owen, of the Royal Commission on Ancient Monuments in Wales, gave valuable information regarding the work of the Royal Commission in the Principality, and also made certain suggestions which are to be considered by the newly-elected Council at an early date. Amongst the principal speakers were Mr. F. H. Cheetham, F.S.A. (Chief Correspondent to the Ancient Monuments Committee for Lancashire), Mr. T. Cann Hughes, M.A., F.S.A., of Lancaster, Mr. F. H. Crossley, F.S.A., of Chester, and Mr. P. C. Brown, of Liverpool.

The acting Hon. Secretary of the new Society is Mr. John Swarbrick, of 30, St. Ann-street, Manchester.

Association of Teachers in Technical Institutions.

The fifteenth annual conference of this Association was held at Newcastle-on-Tyne from June 7 to June 11. In the course of his Presidential Address Mr. F. C. Clarke mentioned the Association had grown steadily year by year in the number of its members, and the weight and importance of its deliberations. It was the recognised medium through which the opinions of teachers in technical institutions were expressed, and through which conferences with them were carried on. The growth of its work had resulted in a considerable step forward since they met last year. He referred to the establishment of headquarters in London at 29, Gordon-square.

ILLUSTRATIONS

Egyptian State Hospital, Cairo.

The illustration of Messrs. Nicholas & Dixon-Spain's Kasr-el-Aini Hospital and Medical School is from the Royal Academy Exhibition. The design was successful in the two-stage International competition, which terminated in March last year. The buildings have a monumental character proper to a State institution, and this quality has been achieved without apparently unreasonable expense.

Church, Institute and Chaplain's House at Shepherd's Bush.

The general lines of this group of buildings for the Royal Association in Aid of the Deaf and Dumb are in the manner of the Institute for the Deaf and Dumb, by the same architect, now nearing completion, in the Clapham-road. On the ground floor there is to be a large hall with billiard room and club rooms adjoining, together with a kitchen and canteen to serve meals for those who have to come from long distances. Above this hall is to be the church with its side chapel and vestry. The church has a raked floor in order that, without effort, all can see; special attention is being paid to backgrounds in order that speaking by hands may be made as easy as possible, and a gallery is being provided for a cinematograph apparatus as much of the work will be carried out by these means. By the side of the church and institute will be the chaplain's house, all being finished in Crowborough brickwork. The drawing we illustrate is in this year's exhibition at the Royal Academy.

The general contractors are Messrs. Holloway Brothers, Ltd. The architect is Mr. Edward Maufe, F.R.I.B.A.

Caterham School.

This design for new memorial hall and libraries at Caterham School, was placed first in a competition held in September, 1923.

The building originally consisted of a hall 50 ft. by 30 ft., but is now to be extended to 66 ft. by 30 ft., two libraries each 20 ft. by 20 ft., entrance hall and vestibule, book store 20 ft. by 20 ft., and heating chamber.

The walls are faced with rough hand-made bricks with dressings of Weldon stone. The roof is to be covered with Lombardic tiles.

One condition of the competition was that the work should not exceed £4,000. The architect's estimate for the building complete, but exclusive of the portico, which was to be built later, was £3,972 13s. 9d., and the lowest estimate received from the contractors (also exclusive of the portico) was £3,923. The building is now in course of erection.

The general contractor is Mr. C. Kerridge, Junr., of Sturton-street, Cambridge. The bricks and tiles are being supplied by Messrs. Ames & Finnis. The iron casement window frames and leaded lights by the Albany Forge, Wainwright & Waring, Ltd., the steel trusses are by Messrs. Smith Walker, Ltd.

Messrs. Kieffer, Fleming & Keesey are the architects.

Tankersley Miners' Welfare Scheme.

The pavilion, of which we give an illustration forms the centre feature of a park which is being laid out in the Bull Wood in connection with the Tankersley Miners' Welfare Scheme. The pavilion comprises a large assembly hall, about 50 ft. by 20 ft., with an open loggia on the south-west side, with men's and women's entrances, cloak and lavatory accommodation at each end; the kitchen and service arrangements being at the rear, and the resident caretaker's quarters on the first floor.

Local bricks and tiles are being used with external rough cast and local stone dressings. The general contractors are Messrs. Thos. Roper & Sons, Ltd., of Mowbray-street, Sheffield, and Mr. Maxwell M. Hart, of 162, Buchanan-street, Glasgow, is carrying out the work to the bowling green and tennis courts which are part of the general scheme.

Messrs. Sydney Tatchell & Geoffrey C. Wilson, FF.R.I.B.A., of Bank Chambers, 32, Strand, W.C.2, are the architects.

ART IN CHURCHES

WE take the following from an address recently given before the Chapter of Leeds by Mr. Reginald Hallward.

It would be easier to speak on this matter if there were any generally accepted views as to the nature of art and of its value to life. In those happier ages when art spoke a common language, emerging naturally through the people as part of the ordinary life, it was hardly necessary to do so: ages in which the noblest production hardly knew itself as art at all. But we should be nearer to a more common understanding if we could rid ourselves of some of the mistaken views about it. We hear of some secret which in the case of stained glass has been lost, and that glass itself is merely a survival. Yet the fact is that we have resources of material, glass of colour and lustre and of wider variety than those of mediæval times. And if it is regarded as a survival only it must surely be that we are not artists enough now to interpret its inexhaustible resources. Both views rest on a complete fallacy, and yet there is, in a sort of inarticulate way, some apprehension of a loss, though we do not know how to attribute it. Is not the secret of the beautiful work of the fourteenth and fifteenth centuries due more to the life than to materials; that it was not overlaid by influences obscuring the simpler outlook that should belong to such things? Their work inspires us because it inspired them, that it drew its strength from deeper sources.

Tradition was once something tangible and real; stood for a practice carried on and developed from generation to generation, a thread often binding intuitively the practice thus unconsciously inherited, until, as has been said, the craftsman hardly knew why he did the things. Yet, being done, it was right, and knew itself to be right. So the craftsman worked in a security with which the ages endowed him until the progress of industrialism, which, in plainer terms, is the substituting of profit for service, undermined and ultimately destroyed this security. It was not difficult to get good work done in the fourteenth century, it would have been more difficult to get it done badly. Yet the work they did was hardly conscious of itself as art because labour's aim was service. I do not mean to say there is not good work done now; far from it—but art is the expression of life lived abundantly, of the pleasure in work, and that pleasure has largely been taken away.

It is not much use applying ideals to art, it is better for practice to reveal them—for the deed to speak—and I have great hopes at the present time that this is felt to be true. Organisation, encouragement of art, art ideals, have had their day. This sort of security for art is found wanting, and the deepening of the personal life, of a simpler outlook is found h William Morris said on one occasion that arts have got to die before they can be again." If he had been alive to-day I thi would have felt that that new birth beginning. But the signs are not to be s in craftsmanship, or machinery, but in th sense of obligation, of service, of that surr which grows out of love of our fellow There is no medicine for art equal to a hun more loyal spirit. From the dawn of civilis the archæologist and historian is finding when the art of a nation turns from religi luxury that nation decays—is destroyed.

It is a criticism brought against artis mean those who bring a more personal direct approach to their work for churches— they are not ecclesiastical enough. That are not, in the sense in which we often regar matter, I do not deny, because it is n external forms, which may be imitated have done duty so long that we shall find We may found our craftsmanship on a ground of traditional example—and we are to do so—our own personal feeling will in itself later, writing over the old the spi experience of the new. There is near her Leeds University War Memorial which illustrate what I mean. It is easy to critic and it does not altogether appeal to me, have no hesitation in saying that there is of vital quality and spiritual apprehensi that memorial than in most "ecclesiastical

The success of a stained glass windo largely dependent on the amount of plea interest and discovery the artist puts int not the amount of likeness in it to mod achievement, and the improved craftsma of to-day is not in itself enough to give us This improvement, though wholly to the should not be mistaken as enough in itself is a means, but not the end, because know is not enough. It is the temper, the outlo our work, that matters. It is not craftsma that we are needing now—there is, of a plenty of it—so much as a humble asp spirit, searching out and giving expressio the divine, the beautiful on which the rests.

But in affirming the need of a more per endowment, I am not suggesting any against the corporate spirit, which is as nece in the arts as anywhere else. We have, how sought it too much in the wrong way external organisation, machinery—and are feeling its failure, because there can b corporate life where there is not the seekin the same things, where the objects of life ar united. And it is because I see in the you men a better understanding of the objec life that I feel so much hope for art at present time. And this leads me to the culty felt by the clergy of how to find good v There is no royal road to this, and the easy of relying on the accustomed methods, or dep ing on popular reputation and worldly succes not aid us. But the will to care for better, vital work will bring us to it.

If much of the security for art in churcl at present a false security, because it has be so much a sort of standardisation, which itself "ecclesiastical art," of low endow and defective artistry, we need not fear th of adventuring a little more. We must risks, but we shall find less risk in the adver in the readjustment of values, which are sf often wrong than in pursuing the old use wont, which has given so bad a name to "ec astical art." I welcome, therefore, very the signs that the clergy are looking for a genuine artistry—one with more vision personal conviction—on which rest the fou tions of all tradition and which will once restore us to it.

Lower Chapel, Eton.

With reference to our description of building in our issue of May 24, the archite the work was, of course, the late Sir A Blomfield, A.R.A. Mr. Walter Ta F.R.I.B.A., is only responsible for the new case, panelling and tapestries.

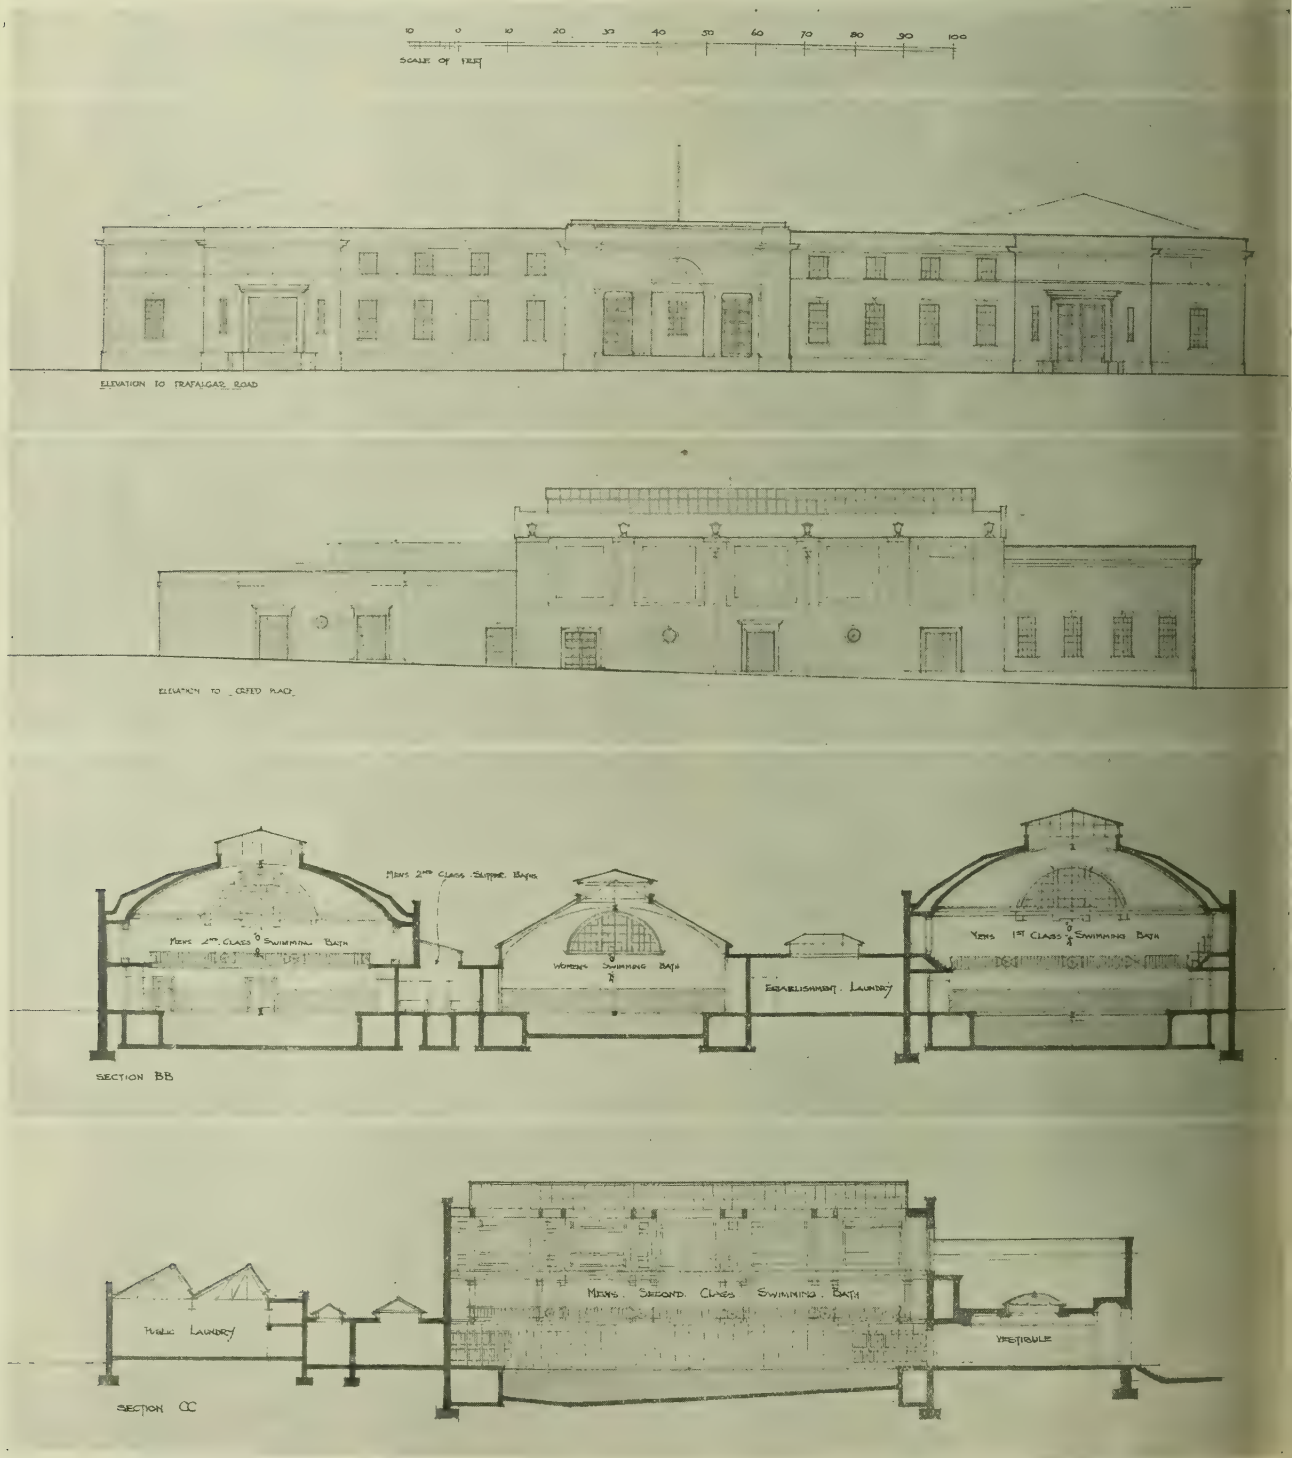
GROUND FLOOR PLAN.

FIRST FLOOR PLAN.

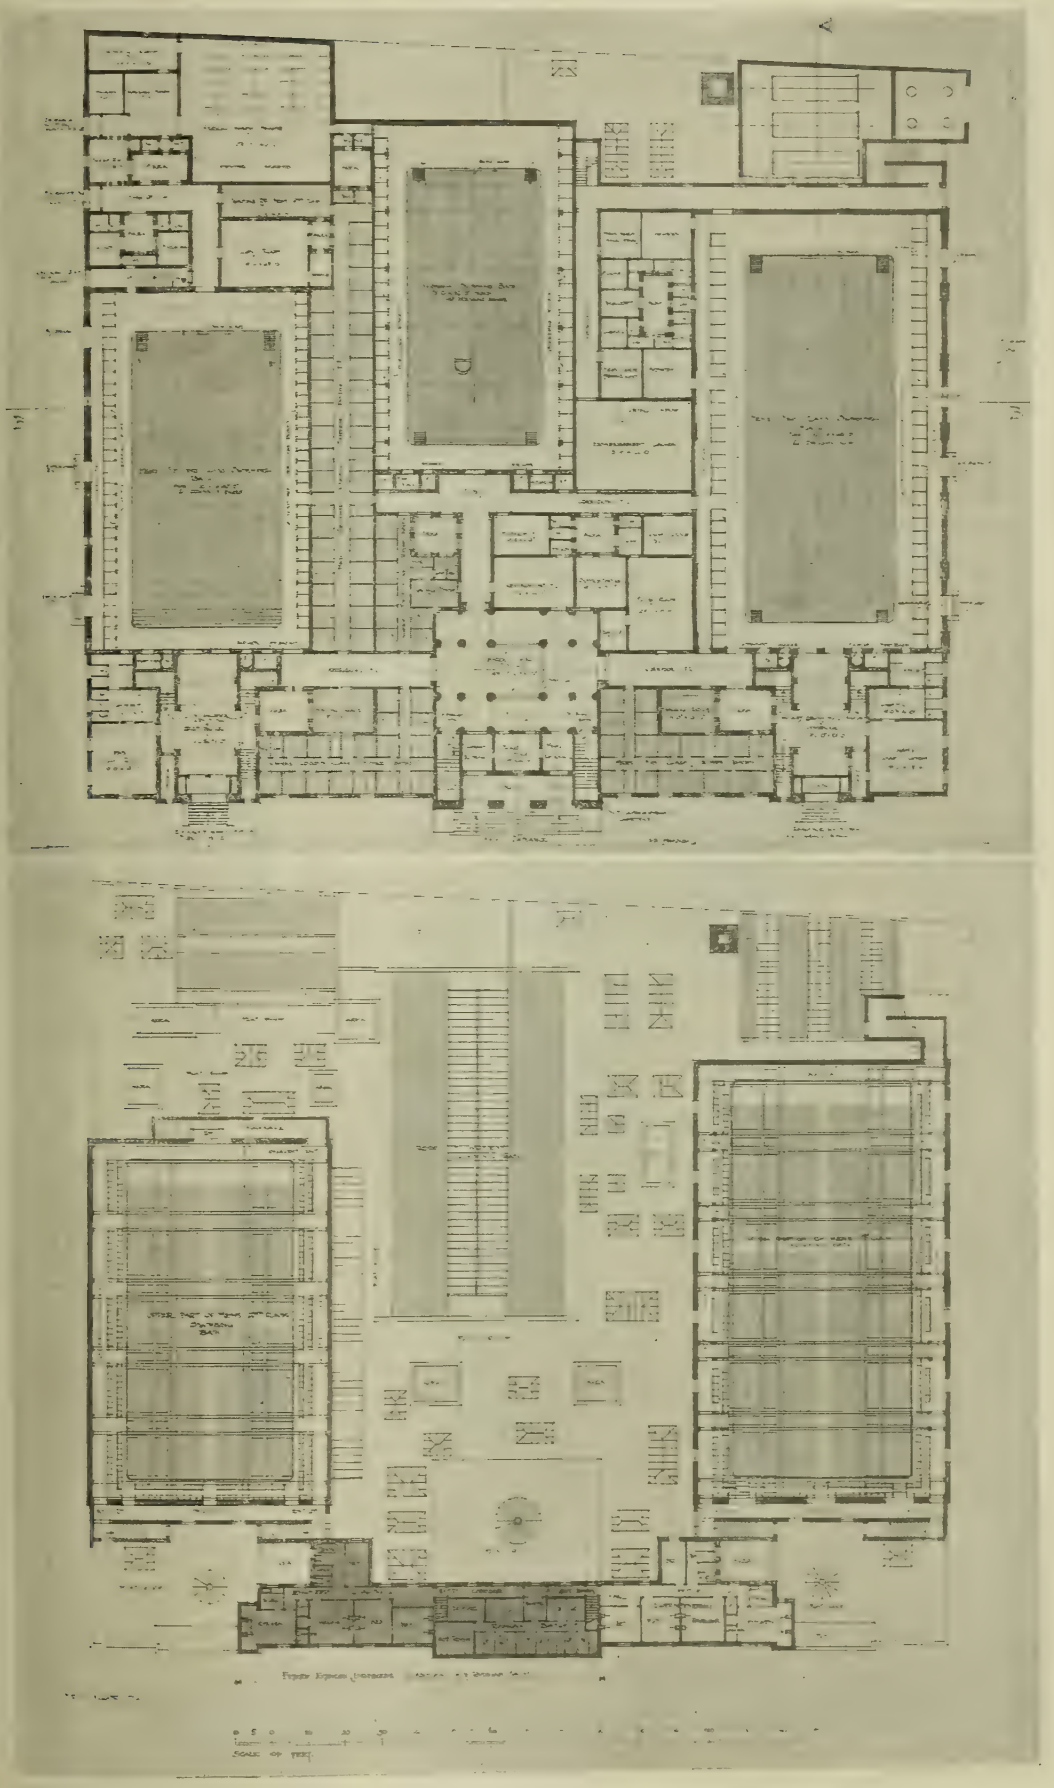
House at Leatherhead. MESSRS. DEANE & BRADDELL, Architects.



This little house stands in the middle of the country town of Leatherhead. The site it occupies was once part of what is still the park of a large house. It is protected from the road by a clump of fine elms, while the long and narrow garden at its back overlooks the kitchen garden of the neighbouring estate. It has been designed solely from the point of view of being occupied by one person, with one maidservant in attendance. The materials used are hollow brick walls plastered and lime-washed and black tarred base. The roof has been covered with old pantiles. These have been a complete success in spite of many warnings to the contrary. Green-painted woodwork with shutters treated in the Dutch fashion give a somewhat foreign air.

GREENWICH BATHS COMPETITION

THE design illustrated on this and the next page was submitted in the recent Greenwich Public Baths Competition by Mr. William Allison, A.R.I.B.A.



The plan was arranged on axial lines, but strict symmetry in planning was sacrificed in order to avoid long corridors leading to the slipper baths, and also to locate the establishment laundry centrally. The main entrance to the baths was placed in the centre of the Trafalgar-road front, which leads into a spacious entrance hall. The secondary entrance to the men's second-class baths and the public laundry was located near the back of the site in Creed-place. The entrances to the men's first and second-class swimming-baths, when used as public halls, were on the Trafalgar-road front, and placed axially on the longitudinal centre lines of the bath halls, which permitted a balanced elevation. The men's swimming-bath halls were placed on the Creed-place and Park-street frontages in order to obtain direct emerge exits into these thoroughfares. The elevat were kept very simple owing to the low ex diture permitted. The materials sugge for the exterior were brickwork with Port stone dressings. The roofs to the m swimming-bath halls were to be supported steel-framed trusses, and internal architect effect gained by suspended panelled fib plaster ceilings.

The design placed first in this competit by Messrs. F. J. Horth & H. And was given in our issue for October 12, 1923

DISTRICT SURVEYORS' FEES

BY AN EX-DISTRICT SURVEYOR.

Fees in Estimates.

E of the petty difficulties besetting a er when compiling an estimate is the ion of the district surveyor's fees. It is to calculate the fees payable in respect new building; it is in the case of an tion or addition that the difficulties arise. a new building is enclosed by party walls, alteration to these affects the adjoining ings, and entails the payment of fees dingly. Also fees are chargeable in respect e underpinning of external walls to adjoin- uildings.

Anomalous Fees.

der the Act of 1894, as originally drawn, alous conditions frequently resulted gh the fee upon an alteration being lated upon the extent of the building ective of the extent of the work. A small tion to a large building caused a dispro- onately large fee to become chargeable; appeals were made to the generosity of the ct surveyor, who was expected to forego portion of his legal charge. He, as a ent man, usually declined to commit lf until after the supervision of the work proved to be troublesome or otherwise, so the builder had either to include the full tory fee in his estimate or run the risk me loss. To a large extent this veil was ated by the Act of 1921, which allows the o be calculated upon the cost of the work o £500, beyond which limit the original m is applicable and is presumed to be able. But is this so? The fee chargeable an alteration costing not more than is only £8 8s., whereas an alteration at a of £550 to a large public building might il a fee of over £30. The scale of fees ed under the Act of 1921 is a reasonable and perhaps, after the year 1926, when this ct is to be reconsidered by the legislature, ar rules may be enacted, the limit of cost extended beyond £500.

Duties Without Fees.

am far from suggesting that district sur- rs are ordinarily overpaid, especially in of their heavy responsibilities. There are s incumbent upon them for which no fees chargeable. Great danger to the public requently arisen through imperfectly fixed ney pots and tallboys, defective brickwork himney stacks and parapets, and through coping stones in the latter. I have climbed ladders to satisfy myself as to the efficient ng of chimney-pots, the effective bonding ickwork in chimneys and parapets, and to effect to the rule of the Act that the upper- courses of chimneys must be built in nt. Yet the Act provides that no fee be charged in respect of the fixing of a ney pot, nor for the repairing of a chimney or parapet, unless pulled down to a greater nt than 12 in.

Fees Without Duties.

there are duties without fees, should there be, as compensation, some fees without s? Usually it is assumed that, where the eyor has no duty to perform, he is entitled o fee; and this is thought to be the rule regard to all buildings exempt from s VI and VII of the Act, relating to rules onstruction. But it should be borne in that such buildings are not exempt from third schedule, which provides for the ment of fees. Take, for example, the case detached greenhouse. It is conceivable here a duty might devolve upon the eyor in relation to the frontage lines of a nhouse on a corner plot. But in most cases would be no such duty; and yet it could ntended that the surveyor is entitled to e because the Act provides for the payment rtain fees upon every new building.

Apart from specific duties entailing specific fees, the surveyor has the general duty that he shall "cause the rules of the Act to be duly observed," and for this he receives no salary, but is paid according to a system of taxation upon building works.

VICTORIA AND ALBERT MUSEUM

Drawings by Inigo Jones.

The series of drawings by Inigo Jones, from the Library at Chatsworth, comprising designs for scenery and costume for use in the masques performed at the Court of James I and Charles I have been lent to the Victoria and Albert Museum for a short period, and are on view at the Museum until the end of June.

In connection with these drawings, the Museum authorities write:—

"A large portion of this collection of designs has been preserved intact, for Inigo Jones bequeathed his collection of architectural and stage designs to John Webb, his assistant and nephew by marriage, and from Webb's descendants the bulk of the collection passed ultimately to the Earl of Burlington, and from his famous villa at Chiswick to Chatsworth, where it has been preserved ever since.

"From 1604 until 1640, the year preceding the outbreak of the Civil War, Inigo Jones was continuously employed at Court, first in some subordinate capacity, then as surveyor of works to Henry Prince of Wales, and finally as surveyor-general to the King. His genius as an architect during these thirty-six years we recognise in his buildings, but we are not accustomed, as contemporary writers were, to hail him as a genius of stagecraft as well.

"Daniel, Davenant, Townshend, and in his earlier masques Ben Jonson, have nothing but the highest praise for his talent and invention. It might be difficult at this distance of time, even in the face of categorical statements of contemporary records such as Royal Accounts, to believe that some of their descriptions of scenery, which imply settings and effects needing elaborate preparation, had actually been realised on the stage, but the priceless additional testimony of actual designs from the hand of the great producer himself enable us actually to reconstruct some of the scenes.

"Nor need we end our reconstruction with scenery, for besides Inigo Jones's pen drawings for the opening scene of Ben Jonson's 'Chloridia' or William Davenant's 'Luminalia,' there are designs for the actual dresses which James and Anne, or Charles and Henrietta Maria, and the Lords and Ladies at Court wore, a series of some 300 drawings varying from the boldest and roughest first sketch by Jones himself to a detailed and careful design by some assistant for the completed dress. There is a tradition that Peter Oliver made some of the drawings of masque costumes, and it may be that some eight exquisite designs for dresses in pen and body-colours with gold and silver ornament are his. Finally, the designs are not, as has sometimes been suggested, mere academic experiments, notes of ideas which were not and could never have been realised. The names of the wearers on the projects for dresses, the splashes of the scene-painters' distemper on the sketches for scenery, prove that the drawings were in fact used for the practical purposes for which they were prepared. A catalogue raisonné of these drawings, with 50 reproductions, is being published this year by the Oxford University Press as the Twelfth Annual Volume of the Walpole Society."

Fireplace in the Girls' High School, Norwich.
Measured and drawn by MR. C. J. W. MESSENT.

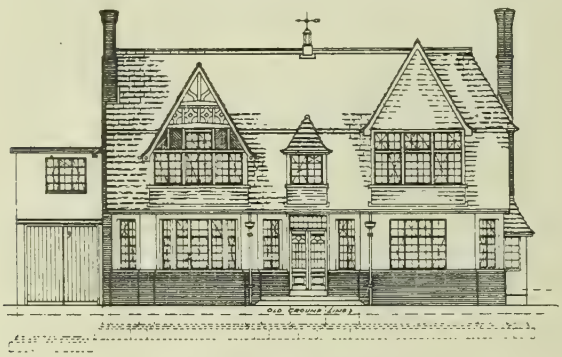
THE REPORT OF THE RENTS TRIBUNAL

THE Tribunal appointed under Article VII (4) of the Local Authorities (Assisted Housing Schemes) Regulations, 1919, and Article II. of the Local Authorities (Assisted Housing Schemes) Amendment Regulations, 1921, has recently issued its Report. Article VII (1) of the Regulation of 1919 provided that in any determination of the amount of the Exchequer subsidy, whether based on estimate or otherwise, such deductions might be made from the amount of the deficit upon which the subsidy is calculated as will, in the opinion of the Minister of Health, represent (*c*) any deficiency of income or estimated income due to the insufficiency of rents charged or proposed to be charged by the local authority, or (*d*) any deficiency of income which is due to the failure of the local authority to secure due economy in the carrying out or administration of the scheme. In the event of any difference of opinion arising between the Minister and the local authority in regard to the above matters it was provided by Article VII (4) that the question in issue should be referred to this Tribunal and the decision of the Tribunal should be final and conclusive.

The Tribunal had to act under certain rules in determining the question of the sufficiency of rents; they had to have regard to (*a*) the rents obtaining in the locality for houses of the working classes, (*b*) any increase in the rent of houses of the working classes authorised under the Increase and Mortgage Interest (War Restrictions) Act, 1915, and any Acts amending or extending that Act, (*c*) any superiority in the condition or amenity of the houses to be let by the local authority under the assisted scheme or in the accommodation provided therein, and (*d*) the classes of tenant in the district for whom the houses are provided.

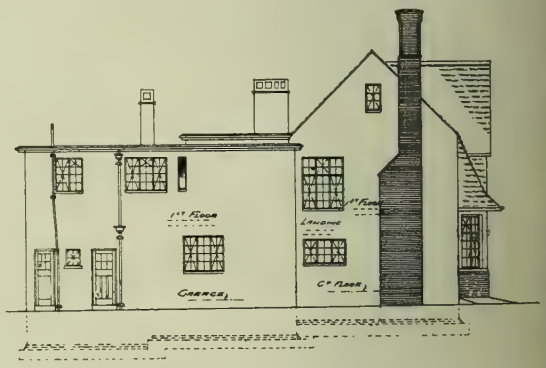
The decisions given in this Report relate only to cases where the question in issue was the sufficiency of the rents charged or proposed to be charged. In the period under review in the Report—that is, since the Tribunal was constituted in 1920 to March 31, 1924—198 cases have been referred to the Tribunal. In 78 cases a settlement by agreement was effected, the Tribunal made awards in 102 cases, and only 18 cases remained to be dealt with at the end of March. The Report contains a model form of pleading which was issued to assist the local authorities in stating their cases, and the results of the awards made in these 102 cases.

The awards are presented in a tabular form showing the type of house, the net rateable value, the rates in the £, the weekly rates and water charges payable on the local authority's rent, the rent suggested by the local authority, the rent suggested by the Minister, the rent fixed by the Tribunal, and lastly, any increase made by the awards in the local authority's rent or decrease on the Ministry's rent.



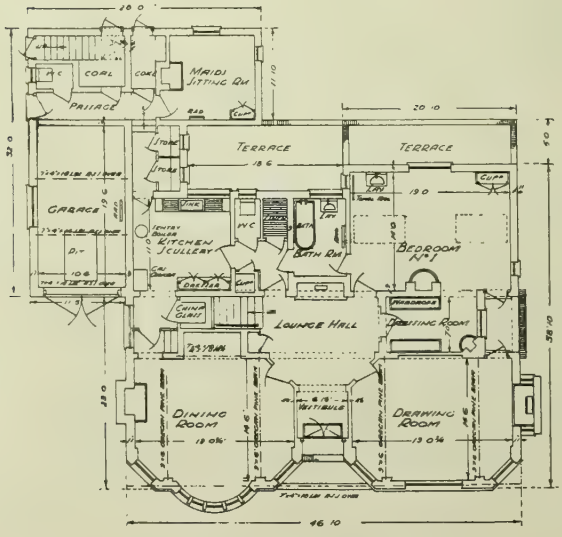
As the cases heard relate to a variety of districts all over the country the report contains some interesting statistical information. For instance, it will be seen that a high poundage in the rates does not in itself necessitate a high rental, but it has to be considered in relation to the assessed rateable value. Thus, take Norwich, which is one of the Corporation Boroughs where the rate in the £ is highest, viz., 27s. The charges for rates and water rates in respect of a non-parlour house with three bedrooms there on the local authority's rent were 6s. 5¼d., and the rent fixed by the Tribunal was 8s. 6d., an increase of 2s. 5½d. on the local authority's rent. For Birkenhead, a Corporation Borough where the rates are 15s. 3d. in the £, the charges on the local authority's rent w 6s. 9d. for a similar house and the rent fixed the Tribunal was 8s. 9d., a decrease of 3s. on the Ministry's figure.

The explanation of the close approximat of the rents in the two places, despite the gr difference of the poundage of the rates, possi lies in the rateable value. In Norwich this £13, but in Birkenhead it was £21. The Rep appears to show that the Tribunal had on whole to assess the rent in these disputed ca very evenly between the figures presented by local authorities and the Ministry.



HOUSE AT ST. LEONARDS-ON-SEA

THIS house faces The Green, St. Leonar on-Sea. The site is about 200 ft. above level, and has a frontage of 100 ft. by 180 in depth. The plans were largely arranged the circumstance that the best bedroom required on the ground floor. This room been treated as a small flat, with bathro and dressing-room attached. The bathro provides a means of getting to the kitch without passing through the hall. On the f floor there is a studio, bedroom for guests, maids' bedrooms, bath, lavatory, &c. main staircase leads to a narrow gallery w French doors opening on to the studio which commands a beautiful view. There a separate staircase off this gallery to la lumber space in the roof. The chauffeur his rooms over the garage, with separate st case.



The builders are Messrs. James Bodle, L of Eastbourne and Bexhill-on-Sea. The arc tects are Messrs. Smee & Houchin, of By House, Fleet-street, London, E.C.4.

TOWN-PLANNING INSTITUTE

RAYMOND UNWIN presided over a meeting e Institute held on May 30, when Mr. nce W. Chubb (Secretary of the Commons Footpaths Preservation Society) read a on "Reservation of Lands, Open Spaces,

Chubb said he had been asked to deal with uestion of the reservation of lands and open under town-planning schemes in the f the Model Clauses issued by the Ministry alth for use in the preparation of schemes. mportance of providing and maintaining nable facilities for recreation was now lly admitted. Indeed, it was safe to that few persons now cavil at the expendi- necessary for the acquisition of parks and g fields because it had come to be univer- recognised that a sufficiency of "Open-air " was only less necessary to the citizen adequate systems of sewerage and water- y.

e Open Spaces movement had grown out of forts of the small band of enthusiasts who, 65, founded the Commons Preservation y. The attacks on commons in Parlia- or at the hands of Lords of Manors were checked and finally stopped by action in ament or in the Law Courts. By these s the Commons Preservation Society had able to frustrate attempts to enclose, or, natively, it had carried through schemes for uarding as open spaces a total area of about 00 acres of common lands in various parts ngland and Wales. Side by side with the sure of commons during the eighteenth and eenth centuries, there marched the steady of former rural population from country to . They rendered still more necessary the rvation of the natural open spaces of the nunity, but, unfortunately, the influx of gricultural labourers into manufacturing cts gave to the common lands a building which they had not previously possessed thereby accelerated the temptation to se them. It follows that, in order to fill e gaps caused by the loss of the commons, urban community was faced with the ing need for acquiring playing fields and s.

ring to the technical difficulties involved, ompulsory acquisition of land needed for ation was seldom attempted. Local orities generally preferred to buy by agree- and to avail themselves of the provisions e Open Spaces Act, 1906, notwithstanding nsatisfactory limitations of the definition e of that Act. This defined an "Open e" within the meaning of the Act as any whether enclosed or not, on which there no buildings, or of which not more than one- tieth part was covered with buildings, and hole or the remainder of which was laid out garden, or used for purposes of recreation, s waste and unoccupied.

is definition seemed to exclude from the al provisions of the Act enclosed cultivated whether arable, meadow, pasture, or wood, ll as land built over to a greater extent than wentieth. Efforts were now being made end this Act and to give to local authorities elastic and satisfactory powers than they possessed to purchase open spaces. When Housing and Town-Planning Act was being ssed in Parliament in 1909, considerable ntion was drawn to the possibilities it pre- d of ensuring for each "town-planned" a well-considered system of public and te parks and playgrounds. It was realised it ought to be made practicable for Councils ok ahead and to take such steps to antici- and control the development of the area in their jurisdiction that the mistakes of past should not be repeated.

e extent to which Councils were entitled to e was indicated in the Model Clause 35 d in 1923 by the Ministry of Health for use e preparation of town-planning schemes. clause sets up the necessary machinery for reservation of lands likely to be required as public open spaces, private open spaces, playing fields, allotments, and sites for elementary schools.

Until they had actually been acquired by the town-planning authority, the lands scheduled for the public purposes indicated—or, in the case of private open spaces, until such date as the Council in each case fix—would continue to be used as they were used at the date of approval of the scheme "for the purposes of agriculture and horticulture, or for such other purposes as the Council may permit." Buildings might be erected upon the lands before the date of acquisition subject to the right of the Council to impose conditions as to their removal after the acquisition. The definition of a private open space was wide and helpful. It was declared to mean "land reserved for use as a private ground for sports, play, rest or recreation, or as an ornamental garden or pleasure ground." The clause also enabled the Council to "acquire by agreement and, if they think fit, convert into a public open space or a playing field any of the lands reserved as private open spaces," as specially numbered in the map. Finally, the Council was given the very useful power "to let for purposes of recreation any land reserved as a playing field when acquired by them, or any land reserved as a private open space when acquired by the Council and converted into a playing field, but no such letting shall be for a term of more than seven years without the consent of the Minister." The wisdom of this last provision was self-evident. It enabled the town-planning authority to purchase land for the playing of games, and to charge for it a rent which athletic clubs or groups were willing to pay for the privilege of being allowed to play games. When the land had been purchased at a low or reasonable price, the return by way of rent for facilities for cricket, football, lawn tennis, hockey, bowls, and other pastimes should be almost, if not quite, sufficient to provide for loan interest and the repayment of capital. It was to be hoped, therefore, that in connection with every town-planning scheme steps would be taken to schedule ample areas of land for recreation, and that in forming an estimate of what ought to be scheduled, regard should be had not so much to the actual necessities of the moment, as to the probable needs of the local community in 20 or even 50 years' time.

Before suggesting steps to be taken under Clause 35 of the Model Clauses he would point out that the model code of the Ministry of Health contained two other allied Clauses which should also appear in every town-planning scheme. These were Clauses 38 and 39, which dealt with aspects of amenity.

But the really important questions before them for consideration were, first, to what extent each town-planning authority ought to take steps to schedule public and private open spaces in acordance with Model Clause 35; secondly, what types of open spaces should be provided, and thirdly, how the powers of the Town-Planning Acts might be most effectively used.

He hoped these questions would be approached with a determination by every town-planning authority that there shall be no repetition of the disastrous mistakes of the past. The whole subject should be approached in a broad and statesmanlike way. The issue should not be determined by a careful inquiry into the minimum needs of the moment, but by an intelligent effort to forecast the maximum requirements of the future. This would, in the end, prove to be the soundest policy. It would be foolish to attempt to dogmatise, but in most urban districts the ideal standard to aim at was the retention as public and private open spaces of 10 per cent. of the total acreage. As regarded the types of open space to be specially protected under town-planning schemes, he considered the advice of the Ministry of Health was most sound. They suggested that it would probably be found desirable, as a rule, to reserve only large areas for open spaces, allotments or the like, as smaller reservations could often be more prudently made later when the detailed development of any particular area could be more clearly foreseen.

It was true that small gardens and pleasure grounds were invaluable in a City, and that every town and village should have its special children's playgrounds with gymnasium, but no Council should, as the town-planning authority, feel that it had done its duty if it rested content with the reservation here and there of tiny pleasure grounds which would, in course of time, be hemmed in with dwellings.

He was all in favour of the reservation of bold and large areas of 50 acres and upwards. The relative cost of maintenance was reduced, the open spaces could be more easily controlled, and a large park, or playing field, helped to preserve the rural aspect of the neighbourhood. But, in addition to large parks, he would plead for the reservation of walks, open spaces, and playing fields at the sides of running water and around pools and lakes.

In cases where a town-planning scheme included the seashore, every effort should be made to reserve the cliff and foreshore. Then he pleaded for the reservation of hilltops and other striking features in local scenery.

It was desirable, too, to arrange for the preservation in every town-planned area of nature reserves where the flora and fauna of the neighbourhood would be protected. Interest in the observation of wild life of every form was rapidly growing and should be encouraged. It was undesirable that a stretch of woodland should be thrown open to indiscriminate use, more especially when birds were nesting, or wild flowers were in bloom. But for nature study every town should have reservations of this kind whether they remained in private hands or were acquired by the Council.

Playing fields should be provided in generous measure. Some would quite properly remain in private hands, but an ample area should be assured for future requirements.

In addition to the public open spaces, various types of private open spaces should be included, if possible, by agreement with the owners. Tracts of woodland, residential parks, existing golf courses and playing fields should be, as far as was practicable, scheduled.

He did not overlook the fact that a programme of this kind might appear to a Council as being unduly ambitious, and so expensive as to be impracticable. That might be so in some cases, but at all events it was better to "Hitch One's Waggon to a Star" than to attempt nothing. Difficulties only arose in order that they might be surmounted, and he was confident that once it was fully realised that town-planning schemes were giving to the public a final opportunity of protecting the interests of future generations, Councils would aim at securing the maximum rather than the minimum area of open spaces.

Mr. W. R. Davidge, in proposing a vote of thanks to the lecturer, said they all knew how the old open spaces of London, such as Moorfields and Spitalfields, had been covered with bricks and mortar, and they would find the same things take place in the outer districts, unless they were careful. It was the custom to blame Governments of the past for doing nothing in regard to the preservation of open spaces, but it was the Government in 1840 which secured Victoria and Battersea Parks for London. That Government did more to secure open spaces than the Government of the present day. It was true the Government was securing land for aerodromes and perhaps in time these would become available for the public. A matter which had to be watched was the acquisition of land by private companies as recreation grounds for their employees. These sites might easily become very valuable commercial sites, and the companies might build over them and find other land for their employees farther out. Mr. Davidge referred to the case of Wimbledon, where people who derived benefit from the Common were assessed, and thought this was a practice which might with advantage be extended.

Mr. G. L. Pepler said that since 1871 the Wimbledon Act had worked well, and he did not see why it should not be repeated. With regard to the proportion of open space, he thought it was better to have one acre for every 200 or 250 people.

Mr. J. Sulman (New South Wales) complimented English town planners on preserving fine trees in their schemes, and said that in Australia people would not listen to him when he suggested a similar thing.

Sir Richard Paget said that, looking to the future welfare of the race, it was probably more important to secure space for school gardens than for playgrounds. If they could ensure that every school child was brought up in touch with nature and with a working knowledge of gardening and the principles of agriculture, the coming race would have the ideal and most rational recreation ready to hand.

Mr. E. Willis (Chiswick) referred to the great efforts which had been made by his Council to preserve open spaces. If they took the river into account, one-fourth of the Chiswick area was available to the public. He wished that smaller authorities could by legislation be helped in securing open spaces.

Mr. H. V. Lanchester considered that density of population should be the governing factor in regard to the percentage of open space.

Mr. E. G. Allen said he had found several landowners in rural areas, who had bought tracks of land because they wished them to be open, were now considering the question of giving these tracks to the local authority, and thereby escaping death duties.

The Chairman pointed out that the question of the taxation of land values was a thing they might expect to have dealt with if the present Government remained in power. This was an important matter from their point of view, and they must consider carefully how far any increase of value which was due to municipal improvements could be kept separate from the general taxation.

ENGLISH DECORATION AND FURNITURE*

The period covered by Miss Jourdain's book on English Decoration and Furniture of the later eighteenth century, which is in every way a treasury of good things, saw the culmination of what may be called the aristocratic art of England and the onset of the decadence which reached its lowest depths in the reign of Victoria. How and why the change set in is partially indicated in the book. Political influences, conquests abroad, archæological research were all important factors in that they made men impatient of anything less than the finest work procurable, but perhaps the change for the worse set in just because the arts of decoration had attained a summit of delicacy and any change meant a descent. The craftsman working under competitive conditions for fame or for daily bread finds in these Western regions that novelty is required of him and after the fashion for light and dainty forms had been exploited to the full a return to massiveness and to something of crudity found many admirers.

The spread of democratic ideas consequent upon the French Revolution or the passing of the balance of wealth from the hands of the older landed gentry to those of the manufacturer enriched by the development of machine production undoubtedly interrupted the steady stream of good taste by breaking up the almost religious respect for a settled order of things and substituting an uncultivated untravelled patron for the critical minds trained in the earlier period, when fashion prescribed the Grand Tour as the proper finish to the education of a high-born or wealthy young man. The actual practice of design, too, was passing from the hands of the travelled student who had actually seen the remains of Rome, Pompeii or Athens, into those of the man who had only studied the published works of these pioneers, and who was placed in an unfavourable position in regard to important aspects of light and colour as affecting ancient architecture and decoration. Greece is decidedly less accessible to the traveller than is Italy, even at the present day, and when the rage for "Grecian purity" or "Grecian massiveness" became fashionable it had to be developed to a very much greater extent upon hearsay, and the reports of the favoured few. It was not possible to import from Greece an army of expert native workers to compare with the band of facile Italian artists who had made possible the faithful execution of Robert Adam's many elaborate designs.

The Renaissance in Rome had been a matter of great public interest, and the school of craftsmanship purporting to resemble that of the ancients had been developed and maintained in such a pitch of excellence that spurious antiques were manufactured that could pass current with all but the most expert critics. Greece, under the heel of the Turk, lacked the means, if not the will, for this sort of dexterity. To turn the mouthpiece of a Nargileh in amber or ebony, or to paint a traditional Ikon, were the artistic attainments of modern Greeks who had no school of the antique from which to send out expert workers to Europe or to England. The Grecian revival in furniture and decoration was severely handicapped by the same restrictions that showed their dismal effects in architecture. The simple soft curves of Roman art are easily learned by a British draughtsman, who finds it a constant labour to reproduce the more brilliant and more subtle curves to be seen in the remains of ancient Greece.

The colour tradition, too, which might have mitigated the clumsiness of the newer revival was allowed to lapse, and crude contrasts of black rosewood and brass, or flashy expanses of all-over gilding, took the place of the well-considered inlays and decorative painting executed by the Italians and the Italian school. The discovery that ancient Grecian architecture had originally been even more brilliantly coloured than that of Rome came too late to affect the growth of the Revival or give life to its dreary heaviness. "The early nineteenth century," writes Miss Jourdain, "was not aware of what it had lost, as we may see by an article by Sir Walter Scott in the *Quarterly Review*, in which he speaks warmly of the change from what was meagre, formal, and poor 'to a character of richness, variety, and solidity.' 'An ordinary chair,' he continues, 'in the most ordinary parlour has now something of an antique cast, something of Grecian massiveness, and elegance in its forms; that of twenty or thirty years since was mounted on four tapering and tottering legs, resembling four tobacco pipes; the present supporters of our stools have a curule air, curve outwards behind, and give a comfortable idea of stability to the weighty aristocrat or ponderous burgess who is about to occupy one of them.'"

Whole worlds of culture are attached to the knowledge of Greek; and scholarship, whether genuine or assumed, favoured the growth of the revival of Greek art according to the information available, which, though extensive, was not complete enough to serve as basis for anything much better than a parody. As Professor Richardson writes in his Foreword: "When the long reign of George III closed, eighteenth-century expression entered upon its final stage. The standard of taste, which had reached the tidal mark of refinement between the years 1790-1800, fluctuated between a coarse imitation of French Empire and an Anglicised version of Athenian Greek, reduced, let it be understood, to the terms of the straight waistcoat. . . . Architects, however, in matters of decoration, were becoming ambidextrous; it was considered accomplishment to design in a Gothic man one day and in Greek the next." Gothic fluences had been latent throughout, an curious mixture of style is to be seen in bureau cabinet illustrated in Fig. 303 B, structed 1775.

The recognisable sanity of the Italian s and its suitability to the method of life of period kept Gothic art in the backgro until interest in it was stirred up by wri of the Romantic school. Its return to fas was doubtless encouraged by a natural re sion from the starched pretentiousness of revived Greek.

The divorce of architectural decoration f sound, straightforward construction is rec nisable in far too many of the elaborate teriors of the period 1760-1820, though defect is partially atoned for by the mast handling of the ornamental detail. genuine constructional vaulting which gi an air of dignity to the Italian Palazzo generally lacking in England, but the ill trations reproduced in the book from ph graphs show that as far as superficial eff were concerned the designers and craftsn prior to 1800 understood to perfection the position of the lights and darks of a comp tion, whether in modelled ornament or colour. They were adept, too, in dispos the architectural features in relation to position of the windows, and in this import matter they succeeded even better than in minor question of ornament, where, if pr tice makes perfect, it also makes monotono As distinct from the architectural decoratio where fans and lacework and the graceful rather unconvincing personages of classi mythology are repeated to the limit of tole tion, furniture gained immensely in qua from the fact that it had perforce to be signed for a definite purpose, and the c struction is nearly always allowed to play part in the finished result. By this me profusion and daintiness of ornament w prevented from degenerating into insipidity

Economy was not to be expected, and upkeep of these stately interiors still nec sitates a prodigious outlay in the labour cleaning long after the first cost has b written off. In this they compare very favourably with the palaces of Eastern lan where solid marbles and mosaic or cera inlays present a sanitary surface that o requires a minimum of attention. Elabor cut-glass chandeliers are particularly troub some in cleaning, and spend three parts their existence swathed in cloth wrappin Fireplaces and fenders of embossed a polished steel also sin against common se in that they are liable to be tarnished imm diately a fire is lighted, and while the gr beauty of some examples shown in the pho graphs must be admitted, the hot-water pi and gas attachments which appear bes them should serve to remind the reader t efficiency must go hand in hand with bea if harmony is to be preserved.

*English Decoration and Furniture of the Later Eighteenth Century—1760–1820. By M. Jourdain. (London: B. T. Batsford, Ltd.) Price £3 3s.

Royal Fine Art Commission.

The terms of the Royal Warrant appointi the Royal Fine Art Commission appea recently in the *London Gazette*. The object the Commission is to inquire into such questio of public amenity or of artistic importance as m be referred to them from time to time by depa ments of State, and to give advice on simi questions when so requested by public or qua public bodies where it appears to the Commissi that their assistance would be advantageo The members of the Commission are the E of Crawford and Balcarres; Sir Aston Wel President of the Royal Academy of Arts; Reginald Blomfield, R.A.; Sir George Jan Frampton, R.A.; Sir Edwin Landseer Lutye R.A.; Sir David Young Cameron, R.A.; John Alfred Gotch, President of the Royal Ins tute of British Architects; and Mr. Thom Hayton Mawson, President of the Town-Planni Institute.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers, annot accept responsibility for contributed s, especially on legal matters.

ay we appeal to our correspondents to it their queries on paper of a size easily and written as legibly as possible, or better in typescript?—ED.

Claims Against Bankrupt Contractors.

R,—If a contractor goes bankrupt and ot finish a job, and the cost of completing nother builder, plus the amount already to the first builder, exceeds the original ract amount, can the employer sell the belonging to the bankrupt builder and y the proceeds towards meeting the extra ?

he contract is R.I.B.A., 1909; a claim nst the bankrupt's estate would have no e, but the value of the plant would just ıt meet the extra cost incurred.

"IONIC."

By the rule *Quicquid plantatur solo, solo* , where a builder has brought materials affixed them to the soil, they become the olute property of the building owner; nor the builder reclaim them should they at time be severed from the soil by the build- owner (see Tripp *v.* Armitage (1839), 4 M. . 687). With regard to plant affixed to the provision is usually made for its removal the builder on or before the completion of work, and, where no such provision is le, it may be inferred that there was an lied agreement that such plant as could emoved without injury to the freehold may emoved by the builder. Often there is a lition in a building contract that in bank- cy of the builder it shall be lawful for employer to enter and take possession of premises, and to employ another builder complete the work, and that the original der and his trustee in bankruptcy shall eit all claim to further payment, except balance there may be on completion of the k by another builder; but a stipulation to effect that on bankruptcy of the builder, or assignment of his estate for the benefit of creditors, the plant and materials, the perty of the builder, shall be forfeited to the loyer, is void, since it violates the policy he bankruptcy laws. The trustee in bank- tcy is the true owner of the bankrupt's erials, implements, and plants (see *ex parte* in *re* Harrison L.R. 14 Ch. D. 19). Where, ever (previous to the bankruptcy of the der), the property is vested in the employer, he has had a lien on it from the commence- ıt of the contract, there is a power given to employer to seize such plant and materials, ject to the question arising under the kruptcy acts as to reputed ownership. It lways a question of fact how far materials plant vested in the employer are in the ıted ownership of the builder. In general, he absence of notice, the builder would be l to be the reputed owner of plant; but it ends whether the materials are so far in order and disposition of the builder as to stitute him the reputed owner thereof.

he R.I.B.A. (1909) contract form contains clause as to forfeiture of materials and plant bankruptcy, though there are clauses as to eiture in certain other events.

lause 15 deals with unfixed materials, nded for the works and already taken into ount for the purposes of a certificate, becom- the property of the employer. No mention nade of plant should the builder become krupt; the materials having become vested he employer are not, it appears, under this se, within the order and disposition of the ractor so as to become vested in his trustee bankruptcy. The word "used" has a erent meaning as applied to materials than n applied to plant. In the former case it ns to consume by building into the work; and in the latter case it means to employ without consuming, except in so far as the plant is so affixed that it cannot be removed (see *ex parte* Barker (1884), 26 Ch. D. 510, and in *re* Keen (1902), 1 K.B. 555.

Clause 26 deals with both materials and plant. If the builder stops the work, after notice given and termination thereof, should the builder not proceed the plant and materials become the property of the employer for the purposes of the work, who may employ another builder to do that work. On completion the original builder is to have notice thereof, and to remove his plant and materials. It is only after a reasonable time has elapsed and after notice given that they may be sold by the employer, the proceeds going to the cost of removal and sale and to the credit of the builder. Under this claim it is clear the employer must account to the original builder for the plant, materials and retention money, though the lien, coupled with the power of seizure and user on the happening of an event, constitutes an interest invested in the employer from the commencement of the contract, protecting the employer against the original builder's trustee in bankruptcy. The original builder still remains the true owner of the plant and materials, subject to the lien.

The test is whether the employer has an equitable right to the plant from the date of signing the contract, enabling him to seize it (see Brown *v.* Bateman (1867), L.R. 2 C.P. 272). In the case in *re* Winter *ex parte* Bolland (1878), 47 L.J. (Bey) 52, the plant was to be deemed the property of the employer for the time being. It was held this gave the employer only a right of user, and that the plant necessarily passed to the trustee in bankruptcy.

From the foregoing, and in answer to the special circumstances stated by the enquirer, it would appear that the employer cannot sell the plant and apply the proceeds, but only has the right of user, and if sold must account for same to the original builder's credit, when the work is completed by another builder. In any case the matter can be determined by arbitration under Clause 32 of the contract, and every attention should be given to delivering the notices required by Clause 26 and the compliance required thereto before proceeding further.

Deadening Sound.

SIR,—Could you tell me of any plan for deadening sounds heard from adjoining houses? This is an old house, and I expect there are thin places in walls and where mortar has given way, and it is most annoying to hear voices distinctly from next door.

"E. G. S."

SIR,—Would a London quantity surveyor be good enough to inform a Provincial one (of many years' London experience on first-class work) what rate per hour "takers-off" and "workers-up" can, at the present time, command in London? First-class men only in question.

"Q.S."

Drying.

SIR,—Can particulars be given of the most simple and efficient form of chamber suitable for joinery for maximum length of 10 ft.? Electric power is available for working fans.

"BUILDER."

Fire-resisting Floors.

SIR,—I should be most interested to hear the opinions of your readers as to the relative merits of pre-cast concrete floors and of those cast *in situ*. I know of no text book that deals with this question in a judicial way, and most available information comes from interested quarters and is therefore very conflicting in judgment.

"STUDENT."

Columbian Pine.

SIR,—I have been warned against the use of Columbian pine owing to its qualities of excessive shrinkage, but have been shown samples of such beautiful figure, free from knots and eminently suitable for stained work, that I am most anxious to use it. My builder assures me that it is quite dry and that I need have no fear of using it, but I should be more satisfied to hear a few disinterested opinions before making a decision upon the point.

"FIGURE."

Rubber Paving.

[REPLY TO "SANITARY."]

SIR,—I have always found where lino has been stuck down that rot has started, not in the joists below, where the porous plaster ceiling allows a sufficiently free draught, but on the surface of the floor boards. The remedy is to first coat the surface of the boards with some preservative solution, such as Solignum. Strange to say, when the lino has not been stuck down I have found no cases of rot set up, and I am of opinion that this is because there is a certain amount of air imprisoned below the lino which is worked about from place to place by the traffic thereon.

"CLERK OF WORKS."

EXHIBITION NOTES

THE ART OF BRANGWYN.

PROBABLY the most remarkable exhibition of its kind ever seen in London is that of paintings and drawings by Mr. Frank Brangwyn, R.A., at 184, Queen's Gate, Kensington. When we remember that what is exhibited here is a small part of the output which has resulted from this artist's labours we are almost inclined to think he has about reached the limit of human capacity. The wealth of colour, the fine drawing, the unerring composition of nearly all we see at Queen's Gate form a wonderful tribute to an unique artistic capacity. It is hardly possible that such a collection can be provided for except in such exceptional conditions as the loan of this fine house by Mrs. Coutts-Mitchie. The breakfast room, dining-room, drawing-room, billiard room, ballroom and tapestry room afford an ideal setting for this accomplished work. After a careful study of the luxurious charm of so many of these pictures the Stations of the Cross strike one with a poignancy which re-enacts the tragedy with quite painful effect. We can call to mind no artist who has so vividly set forth the beauties and tragedies of life with such keen artistic values. This is an exhibition not to be missed and it must be remembered that this artist has long been hard at work decorating buildings all over the world, and that few of us can expect to see the results of his long and strenuous labours in the pictorial decoration of architecture. The very extremes of force and tenderness meet in this wonderful record. At this exhibition are included examples of Mr. Rowley's attractive wood inlay in mirror frames, screens, &c.

NEW ENGLISH ART CLUB.

If the chief objective of the New English Art Club is to get away from conventional ideas of design and method, a measure of success must be admitted, but the present Exhibition contains very few pictures that possess any special beauty of form, colour or technique. The capable painting of a portrait (13) by A. E. John, the river scene suffused with a roseate light (9) by David Muirhead, the clever portrait (44) by R. Wilson Steer, and the painting of a toilet (69) by W. Rothenstein are notable exceptions amongst a lot of very unconvincing work.

BROOK-STREET GALLERY.

Everyone knows what a wonderful spot is Polperro, with its many little stone dwellings climbing the hill sides; it is a very paintable place, but when we see it illustrated by pencil drawings, we realise how much it owes to colour values. The artist of "Polperro in Pencil," Herbert E. Butler, has long lived there and studied it well, and gives us, at the Brook-street Gallery, some pleasant drawings.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

DURING the continued debate on the financial resolutions on which to found the Government's new Housing Bill, Mr. Wheatley accepted an amendment, moved from the Liberal benches by Sir George McCrae, which gave the State power "to withhold contributions in the absence of adequate arrangements for the necessary increase in the supply of labour and material at reasonable prices."

Mr. Neville Chamberlain had previously criticised the Government's scheme very severely, stating that the result would be to make the price of houses rise, and thus increase the rents to be paid by the tenants.

Mr. D. G. Somerville, who spoke with practical experience of the question, characterised the whole programme of the Minister as unreal, impracticable and ridiculous. The great point was the cost of houses. The Prime Minister and the Minister of Health had based their scheme on a house at about £500. That figure included the land. It was said to be £200 for the material, £280 for labour and profits, and £20 for land. It did not include draining, roads, sewering, and other services. Where did these prices come from? He had looked at *The Builder* for May 23, and he had endeavoured to take a number of representative contracts. He found that on May 23 a 48-house contract was let at Croydon. The price for each of these houses was £664, exclusive of land, an excess of £164 over Mr. Wheatley's figures. At Brandon, in Warwickshire, a contract was let for twelve houses, at a price of £556 each, an excess of £56 over the figures of the Minister. At Liverpool there was a contract for 54 six-roomed houses, the price being £625 each, or £125 excess. They had, therefore, on 114 houses, an excess over the Minister's estimate of £15,300. That did not include land, drainage and other services. Suppose they took simply £20 to cover the land, and got an average excess of £160 per house, that meant, on a total of 2,500,000 houses, another £400,000,000 to be found by the country. Taking the Minister's estimate of the whole capital cost of the scheme for providing 2,500,000 houses at £1,250,000,000, and adding another £400,000,000, they got £1,650,000,000, which, with the subsidy expenditure of £1,375,000,000, gave a total capital expenditure over fifteen years of over £3,000,000,000, or nearly half the National Debt. Where was the money coming from? The Minister had not got the men to carry out the work, nor had he the materials. The Minister was relying on the undertaking of the people who joined in the agreement with the National House Building Committee, but the National Federation of Building Trade Workers, which included the key men, had informed the Chairman of their intention to withdraw from the agreement, because no wet time was to be allowed and because of the fear of dilution of the trade by the admission of men over twenty years of age. He denied that there was the need for 2,500,000 houses. There were certain well-defined areas where there was acute scarcity. Let the Ministry concentrate on those areas and build the houses—by the State if necessary. For the rest of the country, let them give a lump sum subsidy of £150 or £200, and private enterprise would build the houses wanted and would be able to let them.

The resolution, as amended, then passed through Committee.

On the report stage, on Thursday, the scope of the Liberal amendment which had been accepted in Committee was widened to enable the State contributions to be withheld in the case of contingencies other than those relating to an adequate supply of materials and labour.

The report stage was concluded and Mr. Wheatley then introduced his Bill, which was read a first time.

On the same day, Mr. Wheatley introduced a Bill "to prevent excessive charges for building materials, and to make provision for securing an adequate supply of such materials." The measure, which was read a first time, is given in full on page 957.

The Thames Bridges.

During a discussion on the L.C.C. (Money) Bill, Viscount Curzon urged on the L.C.C. the necessity of having a real bridge policy for London, and the construction of proper bridges at Charing Cross and Lambeth. He described the St. Paul's Bridge proposal as "extraordinary."

Col. Vaughan Morgan said there was really need for a bridge to take the traffic from the eastern end of Aldwych. That also ought to ante-date any idea of St. Paul's Bridge, which no one wanted, and which should be postponed until more important things had received the consideration they deserved.

Sir Cyril Cobb, speaking for the L.C.C., agreed with the idea that there should be some sort of general commission to consider the whole question of the bridges over the Thames. It was no good talking about St. Paul's, Lambeth or Charing Cross; the whole thing must be treated as one problem. With regard to Waterloo Bridge, the engineer had informed the L.C.C. that within three or four weeks it would be possible to reconstruct the 1,400 ft. which had been taken out of the centre of Waterloo Bridge and to make a temporary roadway for pedestrian traffic. Very soon, perhaps in a month or two, it might be possible to reopen the bridge for vehicular traffic. The weight of the bridge had been too much for the foundations. The weight on one of the piers which had been sunk was 11,000 tons, whereas the weight of the traffic at its maximum on the bridge was 5,000 tons. They had reduced the weight on that particular pier by 1,450 tons, and as soon as they got 500 or 600 tons off the sinking movement ceased.

The County Hall.

Sir Cyril Cobb informed the House of Commons that up to date the expenditure on the London County Hall had been £3,060,000, and the estimated total cost of the building when fully finished, including furniture, was £4,083,000. They had disposed of the old County Hall at a good rent.

Eviction of Government Tenants.

Sir K. Wood has introduced a Bill to provide for the further protection of Government tenants. The measure is supported by Mr. D. G. Somerville and many other members.

L.C.C. Tenements.

Mr. R. Morrison asked the Minister of Health whether he had received a letter from the Tottenham Urban District Council, protesting against further blocks of tenement dwellings being erected in Tottenham by the London County Council; and whether he would now withhold his sanction to the erection by a public authority of any further dwellings of this type upon the area of another authority without its consent.

Mr. Greenwood said that the Minister had received a resolution passed by the District Council, and he understood that a conference had been arranged between representatives of the London County Council and of the District Council to discuss the questions raised.

Supply of Bricks.

Sir C. Starmer asked the Minister of Health whether his attention had been drawn to the case of a landowner in a north-eastern district who, in spite of the prevailing scarcity in bricks, refused to sell the land necessary for the extension of the adjoining brickfield; and whether he would take the necessary steps to obtain powers to intervene in a case of this sort.

Mr. Wheatley said he had considered the case. He thought that owners of land could generally be trusted to act with public spirit in cases in which their land was required for the public good. If he found that the production of building materials was hampered by landowners, he would consider submitting a short Bill to the House.

Sir C. Starmer also asked the Minister whethe he was aware that the increased cost of buildin houses on Tees-side was due to transpor charges of bricks; and whether he would co operate with the local brick manufacturers wit a view to additional plant being installed unde a guarantee to take their increased production

Mr. Wheatley said he had no precise informa tion on the point raised in the first part of th question. As regarded the second, if a fiftee years' building programme was accepted by th House, brick manufacturers should be enable to extend their plant without specific guarantee in view of the continuing demand for thei product.

Mr. P. Harris: Will the right hon. gentlema permit the importation of foreign bricks wher there is an insufficient supply of bricks?

Mr. Wheatley: I have no intention of inte fering with the free supply of building materia

Mr. Hardie asked the Minister if he woul introduce legislation to enable him to preven owners of land with building materials in i from increasing their prices for these con modities.

Mr. Wheatley said that if his hon. friend kne of any case in which landowners had done had threatened to do as he suggested and woul let him have particulars, he would conside what action could be taken.

Public Utility Societies.

Mr. Wheatley informed Mr. A. Henderso that 4,540 houses had been erected by Publi Utility Societies with the aid of the subsid payable to societies under the provisions of th Housing Acts, 1919 and 1923, *viz.*, 50 per cen of the annual loan charges until 1927 and 40 pe cent. of the annual charges during the re mainder of the period of the loans (fifty years He was proposing that provision should be mad enabling increased assistance to be given t Societies, who built houses for the workin classes subject to special conditions as to the letting and to the amount of rent to be charge for them.

BOOK REVIEW

Plan Copying in Black Lines for Hot Countrie By R. J. HALL, M.I.Mech.E. (London Sir Isaac Pitman & Sons, Ltd.) 2s. 6d. ne

Those whose work has taken them to h climates will be glad of any effort that is bein made to improve the methods of printing dra ings, for the deterioration caused by the hum atmosphere is a serious difficulty. Particular is this so with ferro-gallic paper upon which w in England rely so much.

This little book is the outcome of a person visit to India by Mr. Hall, who has thus studi the conditions at first hand. The method whic he advocates is one which has largely been supe seded in this country by the extensive use Ordoverax, and is based on the well-known fa that on exposure to actinic light bichromat colloids become insoluble in water. A negati is made by exposing bichromated paper to t light beneath the tracing, and the process repeated to obtain the positive. By such method the cost of plant and materials is smal on the other hand, the labour is considerabl However, as labour is, in the countries concerne cheap, the total cost compares favourably wit the ferro-gallic process.

The advantages claimed for this process a that the chemicals and raw paper required a not liable to deteriorate and can consequent be bought in bulk, the copies will not fade, ar defects in the originals can be stopped out i the copies. The explanation of the material plant and method of working, is clearly give both textually and illustratively, and the litt volume should prove as useful in India ar countries of similar climatic conditions as t author's well-known earlier publications on t same subject are in this country.

THE BUILDING TRADE

COST OF BUILDING MATERIALS

CHARGES AND SUPPLY BILL

E text as issued recently of the Bill, which read first time in the House of Commons une 5, on the motion of Mr. Wheatley, to ent excessive charges for building materials, to mak provision for securing an adequate ply of such materials. The Bill, which we r to in our leading article on p. 958, applies nglandScotland, and Wales.

t xts as follows :—

Pwer to Investigate Prices.

—(1) Where the Board of Trade receive a esentation from the Minister of Health to ect tht the price of any article or class of les in ommon use in connection with the ding ofouses for the working classes appears he Minter to be excessive, the Board shall e powerto investigate prices, conditions of ply, cos and profits at all stages in respect ich artle or class of articles, and to enquire the maers aforesaid to such an extent and elationo such persons or combinations of ons as he Board may deem necessary in r to eble them to deal with the repre-

ation.

) If as result of any such investigation the rd are atisfied that, whether through the on of a ombination of persons or from any r causwhatsoever, the prices charged or ght to bcharged by any person in respect of such aicle or class of articles are in view of he circustances, unreasonably high, or that conditis imposed or sought to be imposed any peon in relation to the supply of any a articlor class of articles are unreasonable, Board all, in respect of any such article or s of artles, have power by order—

(*a*) to x or regulate prices and to vary rices so xed or regulated ; and

(*b*) to cohibit or restrict the imposition of onditionof supply or the charging or seeking o chargprices in excess of maximum prices xed byhe order.

3) Any uch order may be made so as to ly to an person whose business has been the ject of vestigation and to any person who ears to te Board to be a member of any such binatioas aforesaid, and the provisions of such oer shall be complied with, notwithnding arthing contained in any agreement which ay persons affected by the order are ties, an any such agreement shall have ct accoingly.

4) Wherver it appears to the Board that an er so mae is ineffective to prevent the excesve chargewhich have been the subject of the resentatn, the Board may make an order ending te first mentioned order to all or any sons whe business is carried on in any cified an or so as to apply universally.

5) Any erson who contravenes or fails to nply wit the provisions of any such order ll be liale on summary conviction to a fine exceedg one hundred pounds or to imsonmentfor a term not exceeding three nths, oro both such fine and imprisonment.

Investigations.

2.—(1) F the purposes of an investigation der this et, any officer of the Board of Trade other pson authorised in writing by the ard maye quire the production to him of any oks or cuments relating to any matters ich are te subject of the investigation, and y inspecnd examine and copy the same, and y make uch enquiries relating to the said tters as ny appear to him to be necessary for e purpose of the investigation.

(2) If anperson at or for the purposes of any h investation—

(*a*) knoingly or recklessly furnishes any nformatn or makes any representation which is false in any material particular ; or

(*b*) having the custody or control of any book or document which an officer of the Board of Trade or other person is authorised to inspect under this section, unreasonably refuses or wilfully neglects to produce it for inspection ; or

(*c*) being able to give any information which is required under this section, unreasonably refuses or wilfully neglects when required to give that information ;

he shall be liable on summary conviction to a fine not exceeding one hundred pounds or to imprisonment for a term not exceeding three months, or to both such fine and imprisonment.

(3) Any information obtained at or for the purposes of an investigation under this Act shall be treated as confidential and shall not be communicated to any person except the Board of Trade and the Minister of Health, save in cases where the person giving or producing the same otherwise agrees, and, in cases where legal proceedings are taken, for the purpose of such proceedings, and if any person discloses or publishes any information so obtained in contravention of this provision he shall be liable on summary conviction to a fine not exceeding one hundred pounds or to imprisonment for a term not exceeding three months, or to both such fine and imprisonment :

Provided that any statement, whether oral or in writing, made for the purposes or in the course of any investigation under this Act sha'l be absolutely privileged.

Powers of the Minister of Health.

3.—(1) If after an investigation has been held under this Act it appears to the Minister of Health after consultation with the Board of Trade that the production or supply of any article or class of articles in common use in connection with the building of houses for the working classes is being unreasonably prevented, withheld or restricted by any person, the Minister may by order—

(*a*) require that person to place at the disposal of the Minister the whole or any part of the stocks of such article or class of articles held by him or the whole or any part of the output of the business carried on by him, and to deliver to the Minister or to any person or persons named by him the stocks or output or such part thereof as aforesaid in such quantities and at such time and places and during such periods as may be specified by the Minister ;

(*b*) take power to take possession of the lands and buildings in which the business of producing or supplying the articles is carried on by that person and of the plant and machinery used in the business, or any part of such lands, buildings, plant or machinery, and to retain possession thereof for such period as the Minister considers necessary, and to carry on the business or to make provision for the business being carried on under the direction of the Minister ;

and any such order shall have effect as if enacted in this Act.

(2) When the Minister has taken possession of the premises of any person under any such order, he shall withdraw from possession thereof if and when he is satisfied that the production and supply of the article or class of articles will no longer be unreasonably prevented, withheld or restricted by that person.

(3) If any person fails to comply with any requirement of the Minister under such order, or wilfully obstructs or interferes with the Minister in the exercise of any of his powers under the order, he shall be liable on summary conviction to a fine not exceeding one hundred pounds or to imprisonment for a term not exceeding three months, or to both such fine and imprisonment.

(4) Any order made by the Minister of Health under this section shall be laid before both Houses of Parliament as soon as may be after it is made.

Compensation Payable.

4. Any person to whom an order made by the Minister of Health under this Act applies shall be entitled to receive from the Minister compensation for any direct loss or damage suffered by him by reason of any direct interference with his property or business under the powers conferred by the order ; and the amount of such compensation shall, in default of agreement, be determined by an arbitrator appointed by the Lord Chancellor ; provided that in determining the amount of such compensation no allowance shall be made in respect of the loss of any profits, benefits or advantages that might have accrued to such person had not the Minister taken possession of the premises on which the business was carried on, and no compensation shall be awarded in respect of stocks or output of articles placed at the disposal of the Minister in excess of the maximum prices which could have been charged for the same in accordance with any order of the Board of Trade made under this Act, and applicable or capable of being extended to those articles at the time when they were placed at the disposal of the Minister.

Liability of a Company.

5. Where a person convicted of an offence under this Act is a company, the chairman and every managing director, and every officer concerned in the management of the company, shall be guilty of a like offence unless he proves that the act or default which constituted the offence took place without his knowledge.

Expenses.

6. Any expenses incurred by the Board of Trade or the Minister of Health in the execution of their respective powers and duties under this Act shall, subject to the approval of the Treasury, be defrayed out of moneys provided by Parliament.

Action by the Board of Trade.

7. Anything authorised or required to be done to or by the Board of Trade under this Act may be done to or by the President, or a Secretary or Assistant Secretary of the Board, or any person authorised in that behalf by the President of the Board.

Application to Scotland.

8. This Act in its application to Scotland shall have effect subject to the following modifications, namely :—the Scottish Board of Health shall be substituted for the Minister of Health, the Lord President of the Court of Session shall be substituted for the Lord Chancellor and "arbiter" shall be substituted for "arbitrator."

Short Title and Extent.

9. This Act may be cited as the Building Materials (Charges and Supply) Act, 1924, and shall not extend to Northern Ireland.

Town-Planning Conference, Amsterdam.

An International Town-Planning Conference has been organised by the International Garden Cities and Town-Planning Federation to take place at Amsterdam from July 2–9. Papers will be presented by experts from a number of countries. Among the papers from English-speaking countries will be those by Professor Abercrombie, Raymond Unwin, Thomas Adams, Professor H. V. Hubbard (U.S.A.), Flavel Shurtleff (U.S.A.), and C. B. Purdom. The chief items for discussion will be "Regional Planning in Relation to Large Cities," and "Parks, Park Systems and Recreation."

THE HOUSING PROPOSALS AND BUILDING MATERIALS BILL

It may be doubted if the Minister of Health advanced his cause in his statement of his housing scheme in the House of Commons by indulging even jocularly with the subject of capitalism *versus* socialism. In his analysis of the cost and rent of a working-class house in the first place he put the life of the kind of house he intended to build with the huge subsidies already announced at only sixty years, and on this basis made the cost of the land 1½d. a week, the materials 1s. 10½d. a week, and the labour 3s. 3d. a week, but the finance (that is to say, the interest on the borrowed money) at 6s. 8d., and, as reported, he proceeded to say: "That section of the community which lent not their labour but their credit took twice as much out of the rent of the house as all the useful contributors to the erection of the house." He then complained of the scheme being characterised as socialistic, and said that if it were real socialism he would begin dilution on the 6s. 8d. and end the dilution on the last penny.

The statement shows such confusion of thought that it is only fair to add that the Minister, apparently jocularly, said he was not a good judge of Socialism. In introducing a scheme which is to extend over a long period of years, and which will eventually involve an expenditure of some £1,400,000,000 out of public and local funds, such remarks as this are hardly likely to render it easier to raise those sums, and it may be asked, if the Minister's statement as to "real socialism" be accepted, "Why is a distinction made between the owner of the land who is to be paid £200 an acre and is termed 'a useful contributor,' and the tax and ratepayers, who are to put up the finance?" The workman who is given work at trade union rates of pay is described as "lending his labour," but the persons who supply the funds out of which his wages are paid, according to the Minister's definition of "real socialism," are not to lend the money, but either to give it or have it taken from them. If the Minister diluted this sum to the last penny under his idea of socialism, where would the Government turn for funds when their next scheme had to be financed? This is not an empty inquiry, as it shows where the policy of real socialism must inevitably lead: expropriation can only result in depletion, and a government deprived of credit resorts to force. The labourer without the capitalist behind him must work for what he can get, and the State will compel him to work, and thus we come to the transformation by stages of socialism into Bolshevism, as in Russia, where the labourer really "lends" his labour. The more expansive moments of Ministers serve a useful purpose.

This scheme may not be "real socialism," but its effect will be to extinguish private enterprise in connection with working-class dwellings, to nationalise all such dwellings (which will be erected at the public expense), and to subsidise that class of the community who occupy them by letting the houses at uneconomic rents. That at least is a new departure sufficient for a beginning, and the hints of future expropriation appear surplusage.

If there were any doubt as to where the policy of the Government would eventually lead it is set at rest by a consideration of the Bill now introduced, and to which we refer in our leading article this week, and which we give in full on p. 957, to prevent excessive charges for building materials and to make provision for an adequate supply of such materials, the Building Materials (Charges and Supply) Bill. The scheme has to be carried through at all cost, so bureaucratic methods are at once resorted to. The Bill provides that where the Board of Trade receives a representation from the Minister of Health to the effect that the price of any article or class of articles in common use in connection with the building of houses for the working classes "appears to be excessive" it shall have power "to investigate prices, conditions of supply, costs, and profits at all stages in respect of such article or class of articles, and to inquire into the matters aforesaid to such extent and in relation to such persons or combinations of persons as the Board may deem necessary." By sub-clause 2 the Board is made the absolute arbiter as to the unreasonableness of prices, with power to fix or regulate prices and to vary prices so fixed or regulated, and to prohibit or restrict the imposition of conditions of supply or the charging or seeking to charge prices in excess of maximum prices fixed by the order. This order may be made to apply to any person or combination of persons whose business has been the subject of investigation and to any person who appears to the Board to be a member of any combination, "and the provisions of such order shall be complied with notwithstanding anything contained in any agreement to which any persons affected by the order are parties, and any such agreement shall have effect accordingly."

But further than this, by subclause (4), if this order appears to the Board to be ineffective the first order may be extended to all persons whose business is carried on in any specified area so as to apply universally, and this apparently without allowing such persons to be heard. The penalty for failing to comply with an order or contravening an order is a fine of £100 or imprisonment for a term not exceeding three months, or both. Can this clause have been drafted by the same Government which has failed to induce the trade unions to allow the labour necessary to carry out the scheme to be provided, and which has been satisfied by the offer of youths not exceeding 20 years of age?

By clause 2 all books must be produced, and any person who at an inquiry makes knowingly or recklessly a statement which is false, or who withholds any document, or who even refuses to give information, is made liable to the same penalties. Clause 3 contains the powers of the Minister of Health, who, after an investigation has been held and after consultation with the Board if he is of the opinion that the production or supply of any article or class of articles in common use in connection with the building of houses for the working classes is being unreasonably prevented, withheld, or restricted, may by order require that person to place the whole or part of his stock at the disposal of the Minister, or the Minister shall have power to take possession of the lands and buildings in which the business of producing or supplying the articles is carried on and of the plant or machinery, to retain possession thereof for such period as he considers necessary, and to carry on, or make provision for carrying on, the business.

There seems no appeal from any of the above orders, but an order made by the Minister under the last clause must be laid before both Houses of Parliament "as soon as may be after it is made." Under this last order compensation is payable by the Minister "for any direct loss or damage" suffered by the person by any "direct interference" with his property or business, and this in default of agreement is to be settled by an arbitrator appointed by the Lord Chancellor; but in determining such compensation no allowance is to be made in respect of the loss of any profits, benefits, or advantages that might have accrued to such person had not the Minister taken possession, and no compensation is proposed to be awarded in respect of stocks or output or articles placed at the disposal of the Minister in excess of maximum prices which could have charged for the same in accordance wi order of the Board of Trade made unde Act.

The first thing which will occur to a reading this Bill is that if the situation for "martial law" of this description miniscent of the war restrictions and po that law should apply to all concern the production of working-class dwel The lack of labour is more likely to be to the housing scheme than any profit in materials, yet the Government, takin line of least resistance, is exerting pre on the producers and distributors of ma whilst allowing the trade unions by the drastic system of protection ever put in tice to restrict the labour.

How can powers of the above descri be put in force only in regard to "ar or classes of articles in common use in nection with the building of houses fo working classes" without dislocating market altogether and preventing the tion, or increasing the cost of the erectio business premises and premises require commercial undertakings? The Govern appears to have leapt before it came t stile, to have dealt with profiteering b profiteering was proved to exist, and, h failed to provide the necessary labou agreement, to have omitted to bring l within this "martial law" Bill.

All sections are anxious and willing t operate in endeavouring to solve the ho question, the gravity of which is fully a ciated, but if, in addition to a Housing which pledges the credit of the countr years ahead, and gives certain indu vested interests for a long period, a me such as this Building Materials Bill i essential adjunct, then we think the Ho Bill itself is hardly likely to be acce Class legislation has been tried and pro failure in connection with rent restric and a Bill such as this Housing Mate Bill is a piece of class legislation at its v and would prove a precedent for bureauc interference in almost every relation of life.

LAW REPORT

CLAIM FOR WORK DONE

In the Shoreditch County Court, rece before Judge Cluer, Jacob Finkelstein, ing as the Star Decorators, of 73, Newington-road, N.16, sued Mr. Walschenock, of 205, Evering-road, Cla E., to recover £68 7s. 6d., for painting decorating work done from February 2 March 21, and paint and material supp The claim was made up as to £24 15s., cheque on account, leavin balance of £43 7s. 6d., and £25 for br of contract, making a total of £68 7s. Mr. R. L. Parry appeared as counsel for plaintiff, and the defendant in person. Parry, in opening the case, said the case been adjourned on May 16 because the tract between the plaintiff and the defen was unstamped. Mr. Parry now prod the agreement, stamped, and reading it he said that the work was to be carried to the satisfaction of the surveyor. March 31 the plaintiff asked for a cheque £30, and then the defendant started to c plain of the quality of the work. The plai said it was all nonsense, and offered to l an independent man in to give his opin and, curiously enough, the defendant cho man named Griggs, whom the plaintiff already arranged with to do some spe plastering. On Saturday, March 22, was surprised to find that some men v working on the job. He found out that Wolschenock had engaged men to conti the work. After hearing the evidence, Ju Cluer decided in favour of the plaintiff £31 and costs.

ESTIMATING FOR SMALL BUILDERS

By J. H. BARNS, F.I.O.B.

GLAZIER.

ET glass is usually sold in four weights or nesses, viz., 15 oz., 21 oz., 26 oz., 32 oz., ot super, in crates containing 300 or 200 ft. of glass, in stock sizes for cutting up, to customers' own sizes.

quality of glass ordinarily used for glazing ths, and the commoner quality, which is y very wavy, is termed "coarse." For st class of glazing third quality sheet glass metimes used. Prices are subject to ation.

The cost of taking sizes for and labour expended in glazing sheet glass, including cost of best linseed oil putty and sprigs, is about 2d. to 4d. per ft. super, and depends on size of job, difficulty of access, &c. The inferior kinds of putty may not become hard, and are apt to run down in tears during the hot weather.

Ordinary glazing would include in the prices quoted for usual sprigs and putty to wood sashes, and for metal sprigs and putty to metal sashes. In the latter instance the steel sash bars are usually drilled by the casement maker to receive sprigs. Some metal casements are fitted with wood or metal beads to secure the glass, and the cost of taking out the beads in readiness for the glazier and refixing after must be added. If the sashes have an extra deep rebate, a small additional charge will be made for glazing, because of the extra putty, &c., required.

Roof glazing will be charged at plus 1d. per ft. super where such work does not exceed 500 ft. super—greater areas no extra charge—and cost of all necessary scaffolding, ladders, &c., must be added.

Rolled plate is similar to what used to be known as "Hartley's Rolled."

Copper clips for skylight glazing .. 3d. each net.
Lead or zinc clips .. .. .. 2d. each net.

Hacking out and reglazing would be charged at double the above charges for the glazing of new work.

GROVERS BARS AND FIXING.

100 „ „ ..	4/7 ..	5/6 ..	5/9 ..	6/10

Plates exceeding 100 ft. super, or 160 in. long, or 104 in. wide at higher prices.

The usual thickness of polished plate glass is about ¼ in., but if required of special and exact thicknesses the following additional prices will be charged:—

	Not over 30 in. long or 14 in. wide.	Exceeding 30 in. long or 14 in. wide.
⅛ in. to ⅜ in. ..	5d.	7d.
3/16 in.	3d.	5d.
¼ in. bare or ¼ in. selected ..	1½d.	2½d.
5/16 in.	3d.	4d.
⅜ in...	4d.	6d.

Per ft. super additional.

Add to the above prices for cost of glazing up to 200 ft. 5d. per ft. super; over that quantity about 3d. per ft. super. If glass is glazed in wash leather, add 2d. per ft. run. If black velvet is used instead of wash leather the cost would be similar. Glass is cut to a circular shape by glazier without extra charge, but the cost of any templates or moulds must be added. Glass merchants will charge fractional parts of inches as full inches, *i.e.*, 12½ in. × 12½ in. would be charged as 13 in. × 13 in.

SILVERING (ONLY) TARIFF.

Squares not above	Ordinary quality on polished plate, plain or fluted sheet.	On embossed or decorative work.
	Per ft. super.	
12 ft. sup.	8d.	—
20 „	9d.	—
45 „	10d.	1/3

65 „	1/–	1/6
70 „	1/1	1/7½
75 „	1/2	1/9
80 „	1/3	1/10½
85 „	1/6	2/3
90 „	1/9	2/7½
95 „	2/–	3/–
100 „	2/3	3/6

These prices are subject to a discount, probably 10 per cent. When part only of a square is silvered, the overall size will be charged. When plates are re-silvered an extra charge of 5d. per ft. will be added to tariff prices for stripping and cleaning. Where mirrors are likely to be exposed to wet or damp, they can be finished with a wet-proof backing at a charge of about 5d. per ft. super.

The cost of bevelling to plate glass will vary with the size of pane of glass and width of bevel, &c.

BEVELLING TARIFF.

Width of Bevel.	Up to 10 ft. run bevel on one square.	Up to 14 ft. run.	Over 14 ft. run to 10 ft. super.	To 15 ft. super.	To 20 ft. super.
	Per ft. run.				
Up to 5/32 in. ..	6d.	7d.	8d.	1/–	1/1
„ 7/32 in. ..	6½d.	7½d.	8½d.	1/1	1/2
„ 9/32 in. ..	8½d.	9½d.	10½d.	1/3	1/4
„ 1 in. ..	10½d.	11d.	1/–	1/5	1/6
„ 1⅛ in. ..	11d.	1/–½	1/2	1/7	1/8
„ 1¼ in. ..	1/2½	1/3½	1/5	1/9	1/10
„ 1⅜ in. ..	1/5	1/6	1/7	1/11	2/–
„ 1½ in. ..	1/7	1/8½	1/9½	2/1	2/2
„ 1⅝ in. ..	1/10	1/11	2/–	2/4	2/5
„ 1¾ in. ..	2/1	2/2	2/3	2/7	2/8
„ 1⅞ in. ..	2/4	2/5	2/6	2/10	2/11
„ 2 in. ..	2/7	2/8	2/9	3/1	3/2

Larger sizes additional.

The discount on the above is about 20 per cent.

Feather edged bevelling about double prices for ordinary bevelling.

The tariff for bending is too long to quote, the prices differing with the size of pane of glass, radius of bend and position of the bend on the square of glass.

Special quotations should be obtained from benders in every case.

It is advisable to get an estimate for the bent glass glazed complete, as if the glass is supplied to the firm for bending, the benders will take no risk or replace any square broken or damaged in bending or transit.

The charge for glazing bent glass is about 1s. per ft.

POLISHING EDGES ONLY, STRAIGHT WORK, TO ORDINARY ¼ IN. THICKNESS.

	Per ft. run.			
Lengths not over	36 in.	48 in.	54 in.	60 in.
Widths not over—				
14 in.	6d.	7d.	8d.	11½d.
19 in.	6d.	9d.	11½d.	1/3
30 in.	9d.	1/6	1/9	2/–
Lengths not over	66 in.	72 in.	84 in.	96 in.
Widths not over—				
14 in.	1/1	1/3	1/6	1/9
19 in.	1/9	2/–	2/–	2/3
30 in.	2/6	3/–	3/3	3/6

These prices are subject to a discount. All plates to 10 ft. run are charged at 6d. per ft. run net.

The cost of leaded lights for windows will depend on the kind of glass, whether ordinary clear, tinted or stained, and the width of the lead cames used and design of light. The saddle bars or steel cored cames are usually included in the price of the lights. Plain leaded lights in 21 oz. sheet in 4 in. × 3 in. squares with lead cames would cost about 1s. 6d. per ft. super delivered. The same, but in squares 8 in. x 6 in. about 1s. 9d. per ft. super delivered.

A fairly good design of leaded lights with a touch of colour can be bought for 4s. per ft. super, while for ornamental, or special stained work, the price may rise to almost any figure. It is worth about 4d. to 6d. per ft. super for glazing ordinary leaded lights.

The cost of embossing will depend upon the design chosen, and will vary from 2s. 6d. to 8s. 6d. per ft. super.

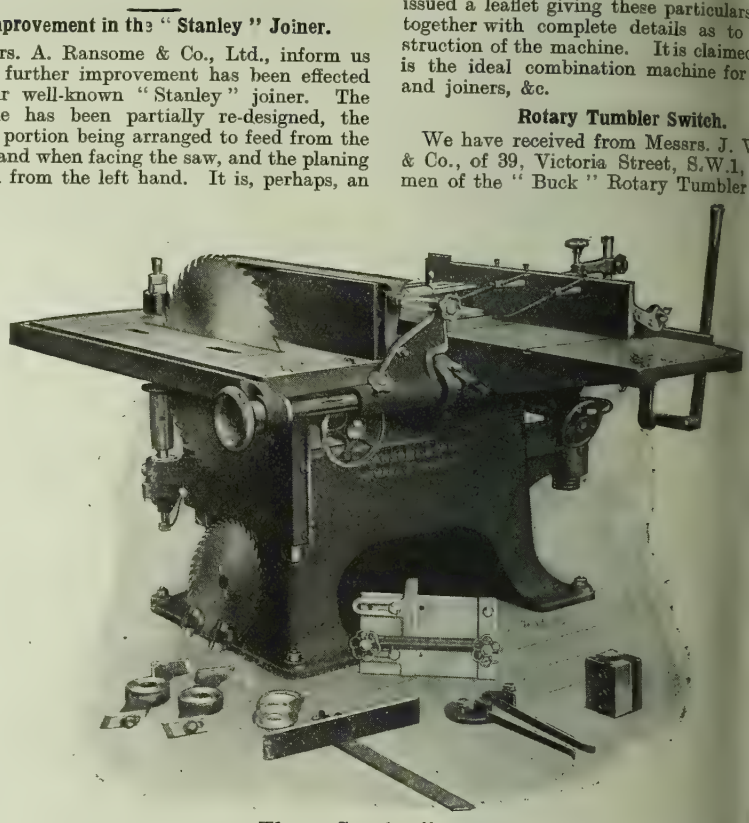
NEW BUILDINGS IN LONDON

Oxford-street.—REBUILDING.—Messrs. G. H. Carter, Ltd., of Holloway, N.7, are the contractors for the rebuilding of 36, East Castle-street, W. All sub-contracts are placed. The architect for the work is Mr. W. A. Lewis, A.R.I.B.A., of Finsbury-square, E.C.

Fulham.—ALTERATIONS.—Alterations are now being made to 145, Fulham Palace-road, S.W. The whole of the building work is being carried out by Messrs. Mullen & Lumsden, Ltd., of Holborn, with the exception of the steelwork, which has been placed with the Aston Construction Co., Eagle Wharf-road, N.

The Theatre Royal.

"London Life" is a play in three acts by Arnold Bennett and Edward Knoblock. Drury Lane continues its tradition, and has produced a spectacle staged in its usual brilliant manner. The play, though somewhat long, has been well received, and no doubt will draw visitors now in London, many of them for the first time, to this historical house. The play grips one to the end, the story is lucidly told, well acted and produced. It is outside our scope to deal with the plot, but it is sufficient to say that, late though the hour, it held our interest to the finish. The outstanding scene is the view on the terrace of the House of Commons along the river, Westminster Bridge, and the County Hall in the distance, which is well represented. Others are the courtyard of a well-known Dickensian inn at Ipswich, and a fête at a country house.

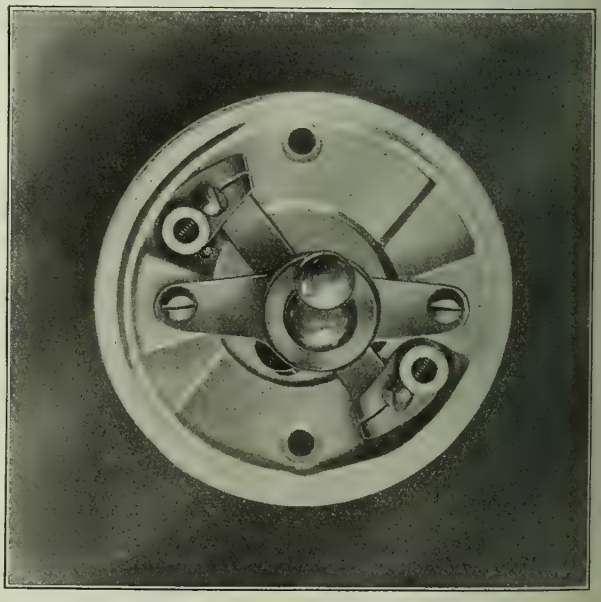


Change of Address.

Messrs. Allen-Liversidge, Ltd., manufacturers of dissolved acetylene and acetylene welders' equipment, have removed their head office to Victoria Station House, Westminster, S.W. 1. The Lighting, Heating and Power Installation Department remains as before at 123, Victoria-street, Westminster, S.W. 1, where the Company's showrooms will also be situated.

NEW INVENTIONS.

Improvement in the "Stanley" Joiner.



Messrs. A. Ransome & Co., Ltd., inform us that a further improvement has been effected in their well-known "Stanley" joiner. The machine has been partially re-designed, the sawing portion being arranged to feed from the right hand when facing the saw, and the planing portion from the left hand. It is, perhaps, an opportune moment to recapitulate the advantages claimed for this joiner :—It will take saws up to 24 in. diameter, allowing a maximum depth of 9 in.; crosscut timber of any length and up to 8 in. thick; surface boards up to 12 in. wide; thickness material up to 5 in. wide by means of a cutterblock fitted to the back end of the spindle; tongue and groove the edges of boards with cutters fitted into the circular planing cutterblock; mortise up to 2 in. wide, and bore holes up to 2 in. diameter to a maximum depth of 8 in.; cut tenons up to 5 in. long in timber up to 8 in. wide by means of cutterblocks fitted to the saw spindle; saw grooves up to 1½ in. wide by means of a drunken saw; stick straight mouldings, beadings, &c., up to 5 in. wide by means of a cutterblock fitted to the saw spindle; form any irregular or curved moulding up to 2½ in. deep from a vertical spindle projecting through the back end of the saw table. Messrs. Ransome & Co., have issued a leaflet giving these particulars together with complete details as to construction of the machine. It is claimed is the ideal combination machine for and joiners, &c.

The "Stanley" Joiner.

Rotary Tumbler Switch.

We have received from Messrs. J. W & Co., of 39, Victoria Street, S.W.1, men of the "Buck" Rotary Tumbler movement of which (illustrated page) is of extremely simple design robust construction. The contacts phosphor bronze, in pairs separated by washers, a new principle giving comple full contact. The contact blade having rotary action, ensures positive make and on both poles. The poles are separated maximum margin of 180 degrees. The tion is complete and damp-proof. The between contacts, viz., 1½ in., gives tional facilities for easy wiring. The is of flat spring steel, and its design that it is never called upon to exercise than one-fifth of its maximum strengt is only in compression during the fra time that the switch is actually being op The covers are produced from heavy material, having burnished or buffed The bases are of vitreous porcelain.

A New Switch.

E HOUSING ACT

ECOVERY OF EXPENSES.

briefly note the recent case Salford
v. Hale (*Weekly Notes*, May 24),
ed a point under section 28 of the
Town-Planning Act, 1919. The
n (appellants) had given the owner of
uses (the respondent) notice under
to execute works on the same in
nder them reasonably fit for human
and as he had not complied with the
Corporation had done the work them-
cost of £623.
24, 1922, an account of this expendi-
sent to the respondent, and sub-
negotiations were entered into between
as to the method of payment, and on
13, 1922, an agreement had been
nder which the respondent paid the
£19 10s., and undertook to pay the
y quarterly payments of a similar
He afterwards, however, declined to
further payments and on August 1,
appellants acting under section 28
(4) made an order declaring the
n question to be repayable by monthly
s.
pondent made default in paying the
erly instalment under this order and
ber 9, 1923, a summons was taken out
covery of this instalment under sub-
. The respondent had contended, on
ng of this summons, that as the
had sent him a complete account of
diture they had incurred in the first
his showed that they had elected to
ne money under subsection (3) and
not subsequently proceed under sub-
. the point of this being that if the
gs were held to be taken under sub-
. then they were out of time, for under
ction and section 11 of the Summary
on Act 1848, the proceedings must be
hin six months from the "date of
e of notice of demand," the words used
ion 3). If the proceedings were taken
section (4) they were in time. The
y magistrate had decided that the
had elected to proceed under sub-
and had dismissed the summons.
eal the Divisional Court overruled this
nd remitted the case to the magistrate
rection that the respondent be ordered
e instalment claimed. The Court held
appellants in delivering the demand
hole sum in the first instance had not
themselves from proceeding under
4): That subsection (4) must not be
urably to obtain a payment which
t otherwise be obtained, but here
n of the appellants had been quite
d they were not debarred from pro-
nder subsection (4).
se is briefly reported and will not be
reported in the Law Reports and any
we make must be taken as having no
, but as the two subsections have been
is case not to be mutually exclusive it
satisfactory to know what will amount
tion to proceed under subsection (3).
se under consideration only a demand
made for the whole sum, no summons
en issued, but the time, six months,
by the Summary Jurisdiction Act is
tion (3) of the Housing, &c., Act, 1919,
m the service of notice of demand.
ns only six months within which pro-
must be taken under this subsection.
appear reasonable to consider that an
not made until either (1) a summons
ly been issued under subsection (3), or
ations for payment by instalments
completed within six months. It
ceed that in this case the latter con-
been fulfilled; the demand was made
922, and the negotiations for payment
ents were completed by agreement
13, 1922.

(For rates of wages in the Building Trade in Scotland, see page xcv.

CONTRACTS, COMPETITIONS, &c.

Forsome contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

Housing at Durham.

The annual meeting of the Durham and District branch of the National Council of Women was held recently at Durham. An increasing membership was reported by the President, Miss M. L. Stafford Smith. Miss Smith said she could not speak too highly of the enterprise, which they hoped would have a real achievement, on the part of the branch to do something definite to improve the housing conditions in Durham. They did what they thought wisest, however, in calling together others of experience to join with them.

PROPOSED NEW BUILDINGS & OTHER WORKS

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

ABERDEEN.—Plans passed by T.C.: Bungalow, Anderson-drive, for Messrs. Brown & Watt, architects; house, Rubislaw Den South, for Mr. Charles H. Rankin; bungalow, Westburn-drive, for Mr. William Ewen; Messrs. Williamson & Bell, architects; bungalow, Broomhill-road, for Mr. Henry G. Stephen, per Messrs. D. & J. R. M'Millan, architects.——The water supply at Woodside is to be improved at an estimated cost of £4,100.

Fire at Govan.

rge part of the premises of Messrs. James e & Sons, Ltd., Clyde Engine Works, oyne-road, Govan, was destroyed recently e. The damage done by the fire is esti- l at £70,000.

THE SCOTTISH BUILDER

SHORTAGE OF HOUSES

THE Executive Committee of the Association of District Committees in Scotland, at the request of the Scottish Board of Health, appointed their chairman and secretary to attend a meeting of representatives of English and Scottish local government organisations with the Minister of Health and the Secretary for Scotland in connection with the proposed new policy of State-aided housing, The meeting took place on April 25 last, when a statement was made by the Minister of Health, in which he suggested that the representatives of the local authorities should appoint a Committee to consider the question of the financial assistance which the local authorities would require in connection with any new State-aided scheme that might be evolved by the Government. It was agreed to appoint such a Committee, and the chairman and the secretary of the Association were nominated as members.

The Scottish representatives on the Committee held a meeting recently and, after going into the whole matter, including a consideration of the report which had been issued by the National Housebuilding Committee set up at the request of the Government, arrived at the following resolutions :—

1. That this meeting welcomes the steps taken by the Government to bring the building trades and manufacturers of building materials into a sympathetic interest in the housing shortage.

2. That this Committee, while appreciating the need for suitable machinery being set up to insure an adequate supply of building labour and building material for the provision of the houses required, and while welcoming any assistance that can be given to them by representatives of the building industry towards a solution of the housing problem, strongly represents that all the rights and powers of local authorities under the Housing Acts must be reserved to the local authorities.

3. That the subsidy to be given by the Government should be two-thirds of the annual deficit, the local authority having the right to fix the rents, and that no greater State control should be exercised than that which now obtains in connection with the slum improvement schemes.

4. That the Government be asked to insert in any Housing Bill to be placed before Parliament a clause to the effect that, notwithstanding the standard minimum size of the house in the Bill, the Scottish Board of Health, in special cases, should have the power, on representation from any local authority, to reduce that standard.

Further conferences, it is reported, have taken place with the English representatives and with the Minister of Health and representatives of the Scottish Board of Health, as a result of which the Minister has indicated what has been generally regarded as a favourable proposal, so far as local authorities are concerned, which provides for the liability of the local authorities being limited to a reasonable amount. A special effort is being made to secure, in view of differing conditions, special consideration for Scotland as compared with England, and also for the rural and less favourably placed areas whose burdens even under the improved terms proposed would be excessive.

NEW BUILDINGS IN SCOTLAND

Aberdeen.—HOUSES.—Plans passed for four houses to cost £5,300, and alterations to existing property to the value of £4,025.

Beith.—HOUSES.—The Northern District Committee of Ayrshire C.C. has accepted tenders for the erection of three blocks of houses in flats, amounting in all to £4,276.

Torry.—SCHOOL.—The Aberdeen E.C. has been recommended to erect a new school.

Waterside.—SCHOOL.—The Ayrshire E.C. has instructed the clerk of works to report on the cost of remodelling the school at Waterside.

Stirling.—BANK.—The Town Clerk has been asked to report on a proposal to institute a municipal bank at Stirling.

Stevenson.—HOUSES.—The Northern District Committee of the Ayrshire C.C. has accepted tenders for building 10 blocks of flatted houses. The extent of the tenders is £12,541.

Govan.—HOUSES.—The Glasgow Dean of Guild Court has passed plans for houses at Whitefield-road, Ibrox-street and Gilmour-street, Govan, for the Glasgow Corporation Housing Department. The estimated cost is £42,350.

Dalry.—FLATS.—The Northern District Committee of the C.C. of Ayrshire has accepted tenders amounting to £4,282 for the erection of three blocks of houses in flats.

Portsoy.—EXTENSIONS.—The Campbell Hospital Board adopted plans for the extension of the Infectious Diseases Hospital, at an estimated cost of £1,500.

Lethanhill.—SCHOOL.—The Ayrshire E.C. has decided to build a new school at Lethanhill of the semi-permanent type.

Paisley.—HOSPITAL.—Tenders have been accepted for extensions at the Royal Victoria Eye Infirmary, amounting to nearly £5,000. The furnishings and fittings will bring the total expenditure to almost £7,000.

Arbroath.—HALL.—The District Committee has approved of plans for a new hall to be erected at St. Vigeans.

Inchcolm.

The twelfth-century monastic buildings on Inchcolm have been taken over by the Ancient Monuments Department of H. M. Office of Works, and are now accessible to the public. A party was recently taken to Inchcolm by Councillor Thomson, manager of the Scottish Motor Traction Company. The company included Mr. R. Beveridge, Mr. D. Lyon, Mr. J. G. M'Callum, Mr. J. Inglis Ker, and Mr. J. Wilson Paterson, A.R.I.B.A., architect in Scotland to H.M. Office of Works, who took the party over the Abbey and explained the scheme which the Board intend to carry out.

XXVI.—No 4246. JUNE 20, 1924.

THE POLITICAL HOUSE

HE Government housing proposals would seem to confirm the belief of those who have assumed they were dealing with a chronic condition. That we should gradually lose count of the various housing schemes is perhaps excusable, but we are beginning either that we are losing sight of the original ideals or ır politicians are contriving to kill them.

›bably everything that can be said on the urgent need ıses has already been said, and from sheer weariness m is being choked and formalised in its utterance. ıments come and go, amidst social movements which slowly and economic forces which often change quickly, e housing question apparently moves in a fixed groove. ıor prophet could safely say that long before we have he end of a fifteen-years' housing programme our social conomic conditions will have altered and that we shall to other counsels. It is important that we should look though it is doubtful if true happiness lies this way; we look ahead in the spirit of the author of "Dædalus" fairly certain we shall concern ourselves more with the of the moment and less with legislation designed for the of posterity. In his little book Mr. J. B. S. Haldane es a possible social development during the next hundred which makes anyone chary of believing that the wisdom housing reformers and politicians is the wisdom of the It is surely something of a comedy that our politicians l be outlining their programme forty years ahead, knowing, do, that it is being discussed as a problem which is largely sed of abnormal conditions. It is a truth, which only ence will prove, that in this matter the short view in tion would give the most beneficial results to the nation. ight almost say that the short view contains all the tages and none of the disadvantages, since nothing seems certain than the fact that the long view will cause a lerable amount of harm while it is discovering that its ımme is obsolete.

is one of the anomalies of the housing problem that the ion was created artificially, and it is perhaps characteristic we should have our biggest ideas when building costs are when a housing shortage is acute, and (most important) when a large proportion of the people are unemployed. ıust build houses, but we can afford to pay neither an mic rental nor even a moderate rental when we are unem- d. These factors may not have a distinct connection with other, but that they have some bearing on each other is ıd all doubt, and it is well to remind ourselves that an ial cause is still operating amidst artificial conditions. situation is so manifestly absurd that it is impossible to e that it is anything more than temporary. It is idle to late now whether this situation was foreseen by politicians; sufficient that the situation is being exploited to the full.

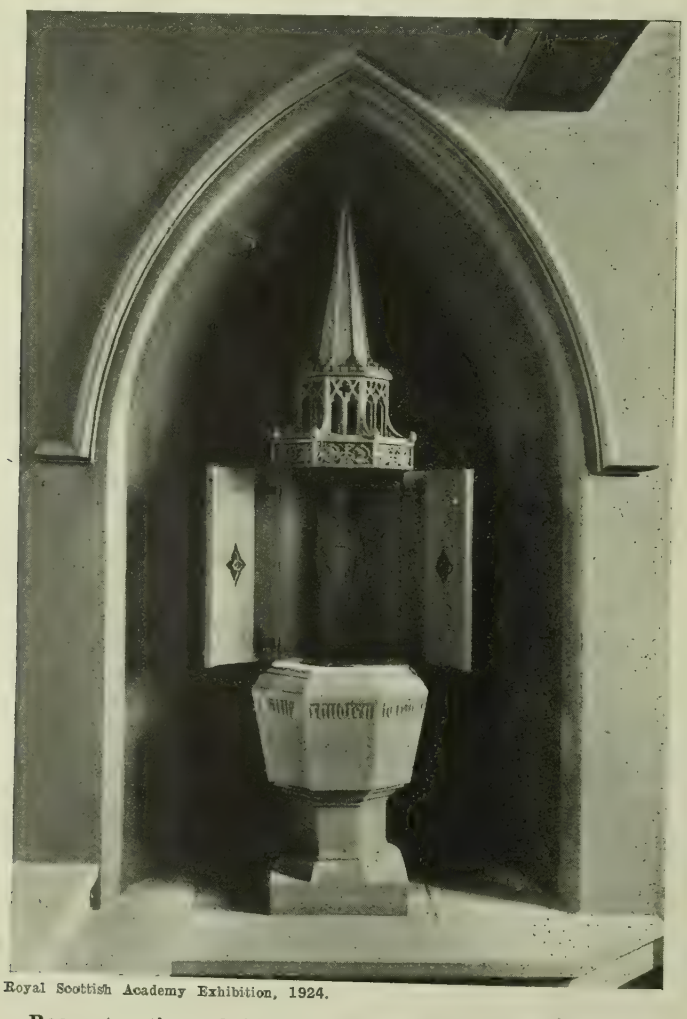
e do not subscribe to the popular theory that private prise was directly responsible for the creation either of or modern suburbia. The fault lay partly with our ation; our building by-laws helped to create the slums maintained them by very rigid structural conditions. We e the laws were interpreted faithfully, and the recognised ions of public authorities strictly performed. The housing ems of past generations are represented by our slums y, and they point the moral that there is at least a possibility that we may be creating social misfits for posterity to deal with. Whatever criticism we care to apply to pre-war housing we must at least recognise the important fact that it was not a financial burden on the nation. It was not because of this virtue that its shortcomings are so great; on the contrary, the problem of better housing was always there, and was largely a question of superficial yards of land and street planning. The housing problem of to-day means financial losses and State subsidies, and has a distinct connection with the high costs of building. Cause and effect are to be seen operating in a vicious circle, and it is difficult now to realise that better housing, as an ideal, has no real connection with sacrifices and penalties. The impression has been created that ideal housing and subsidies are inseparable, and this belief appears to be confirmed when we see a desire to legislate many years ahead for the disposal of State funds and the consequent heavy taxation, regardless of probable economic movements. These two assumptions probably spring from the same source, and if we cannot at the moment prove that they are distinct fallacies there is at least evidence to indicate that it would be wiser to adopt a shorter view of the problem. For a short period the nation must accept huge liabilities for its housing policy, but it is fairly safe to say that force of circumstances will render obsolete any long-dated Bill which ignores the factors we have mentioned.

We frankly admit we have a lurking suspicion that the housing problem would cease to interest the politician were house-building again to become an economic proposition, when the distribution of State funds would no longer provide the main element of political contention. It is obviously easier to allocate State money than to face the issues of a real housing problem, and if this statement is disputed the plain fact must be faced that houses can be built, and are being built, which neither traffic with beauty nor conform to the principles which we have been led to suppose were essential to modern ideas upon housing. The excuse that they do not come within the category of "workers'" houses only confirms our opinion that the legislation which is necessary to secure certain elementary conditions is obscured by the obsession to obtain as much as possible in the form of subsidies. In other words, we see the principles of good housing mixed up with theories to provide houses, and an objective which seems to be merely a matter of quantity in relation to subsidies.

There is still a great field for our legislators in tackling the problem of lowering national and local taxation upon houses, but we are afraid that the idea of encouraging the individual to build his own house will receive little attention while the opportunity exists to exploit the facile theory of building by subsidies. It is true that a slight concession has been made by repealing the House Duty, but a braver course, we think, would have been to modify the rate of income-tax on house property. If we are to face facts squarely, it must be confessed that a prospective house owner contracts a number of responsibilities quite out of proportion to the advantages to be obtained by ignoring them, and this at a time when every encouragement ought to be offered to him. A rebate on income-tax on house property can surely be justified as reasonably as that on, say, life assurance, and we leave it to anyone to work out the philosophy which believes in granting rewards to the prudent. House building in ceasing to be an individual responsibility is none the less a necessity.

NOTES

The Institute and Amalgamation.



FEW members of the Royal Institute of British Architects who attended the special general meeting held at Caxton Hall on Tuesday to confirm or reject the proposed scheme of amalgamation with the Society of Architects knew of the proposals which had been made to reach agreement within the Institute, and no one could have been prepared for the extraordinary enthusiasm of the meeting or the readiness with which the Council's resolutions were passed. The Council's scheme had been endorsed by a two-to-one majority at the recent Council election, and the new proposals (which are reported on p. 977) to obtain a final and binding postal vote, viewed from one standpoint, appeared to be somewhat superfluous; but after Tuesday's meeting no one, surely, can doubt the wisdom shown by the Council and subsequently the meeting in accepting them. What might at first have looked like a graceful concession to a defeated party is now seen to be a statesmanlike act, which should make much easier the progress of the Council's scheme. In numbers alone the meeting was probably a record Institute gathering, and over 600 members must have been present from all parts of the country—from Belfast and Elgin, and even from Australia—while the businesslike manner in which the proceedings were conducted, and especially the able speeches of Major Harry Barnes in moving the various resolutions of the Council, did much to turn desire to agree into what appeared like agreement itself. The result was a very remarkable display of solidarity and enthusiasm, which promises well for the future.

The Next Steps.

THE decision to take a postal vote carries the amalgamation proposals as a preliminary to registration a long way forward, as it is not likely that the 30 per cent. of the electorate who failed to record their votes at the recent election will all be stirred from their apathy and vote; and even if they do, we believe the majority will be in favour of the Council's proposals. In any case, it will be of interest to state the probable course of events in the immediate future. The post-cards, we believe, will be sent out this week and will be returned about July 5—just prior to the confirming meeting two days later. The proposals have then to be confirmed by the Society of Architects, and a meeting for th pose will probably be held in the of the month. The proposals will if agreed to, be sent to the Privy C for their consideration, and all bein this should be possible by the end same month. On the assumption finally the proposals will not be op by the profession itself, the Privy C are not likely to hinder progress, a the opening of the session 1924–5 an mation should have become an a plished fact. The events of Tues meeting give grounds for hope tha old days of division and destru criticism are at an end, and that th fession will now go ahead as a united with general good feeling throughou ranks.

The Salon.

A VISIT to the Salon in this year, where one see sculpture and pic almost by the acre, sug many thoughts, and aids us in formin estimate of the nature of contempo art. And it will help us all the mo anticipating our visit to the Salon visit first the Galleries of the Lo This will enable us to view the mo works at the Salon from the perspective. We admire the su achievements of mediæval art no though feeling that it does not be to us and does not express us. modern world has wandered far fro these grave beauties and convictions the last generation has also wand from the deep feeling for nature humanity revealed in the Barbizan sch for herein we see intense purpose with revelation accompanying deeply-felt pulses. And the question arises, on l ing at such an exhibition as the pre Salon: with what are we replacing subject matter of the one, its reverc for mediæval beliefs; and the democr reverence for the common life revea through the other? We see the latter, work of Millet and Corot, finding divine, the supernatural in humanity nature itself. The work in the Sa taken as a whole, reveals little that can identified with either aim, and so it mi life almost altogether. It reaches, fact, nothing in particular at all exc elementary craftsmanship, if the to with which the artist works may be s to represent anything. Without subj matter it hardly reaches through to a but the most superficial acquainta with the externals of life and nature, a not always that. Nothing has revea more the poverty of subject matter, t lack of interpretation, than recent w memorials. It would appear that t world is so much with us that it does n permit of art or belief reaching to a depth of conviction at all. The inquir may well ask as he leaves the buildin What will happen to these multitudes pictures and statues touched so little any divine fire?

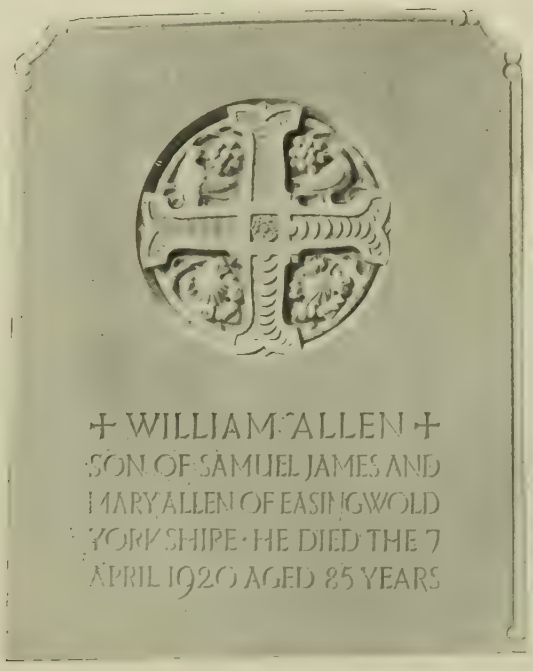
e
iser
in.

IT is not only in our own country that the advertiser offends, and we may easily make too much of what is one towards the removal of field sements in England. A journey nce will acquaint us from the windows of the virtues of commodities assaulting us from t pastures of France. The escape l this will be slow, and needs the al pressure of the newly-aroused pinion if we are to be freed from use. What is chiefly contributing nge is the very evident improve- street advertising which empha- e defect in taste and method of eld advertisements. And there many forms of advertisement of charming us by their good d becoming artistry that these rvivals can hardly now serve the for which they were intended, in us, as they do, the desire to thing to do with the commodity rtised. With the great improve- lettering, in street signs, and ays, we may hope that as these more usual and therefore familiar ous poster with its "close up" nomy, so ugly in character, will ntinued and that lapses from l be less usual. There is much to nd in Mr. Beresford's proposal er to *The Times* that each shop ness as far as possible should have a painted sign. At any rate, the only sensible attitude is to look at advertisements as requiring taste and beauty to make them of serviceable use.

Waste of Time.



THE revival of village communal life, which is being encouraged by the Village Clubs' Association and the Women's Institute, should do much to mitigate the intolerable dulness of the country. May we urge a plea against certain pitfalls in the path of organised betterment? There is a certain fussiness about some reformers which confuses usefulness with the purely temporal, and distraction with entertainment. By all means let us make gloves and arrange whist drives, but let there also be a place for those personal crafts which the machine-made product has banished. Elaborate wood carving and fretwork, even the finest stitchery and lace, are not a waste of time. They contribute a personal value to life and the home for which nothing else can compensate. Many of us only recognise a great grandparent by an old sampler worked by a forgotten namesake "aged ten." Meccano and crystal sets will look after themselves, but in every village there are certain temperaments who like spending time on something that keeps. In fostering this spirit the new movement is doing work that will also keep. So much that we believe to be useful is merely waste of time, and the loss of village skill in art is the result of this delusion.

The Verandah.

THE growing popularity of the verandah, balcony, and terrace opens out interesting possibilities in small domestic work. It is now rather the exception than the rule to find new houses of any size planned without provision for the enjoyment of open-air meals. There is a world of difference between going out to sit on the gravel path and merely opening a door leading to what we may call an open-air room. Architecture, as we know, evolves through changing needs, and the popularity of the verandah opens out great possibilities of pleasant architectural development.

"Painted Signs."

THE recent discussion on the subject of shop signs came hard on the heels of the opening of Messrs. Liberty's Tudor House, and it seems a little strange that the building was not mentioned in the discussion. Not only are there actually swinging "painted signs" outside the entrance, but, more than that, the whole building itself, inside and out, is surely akin to some great "painted sign" of a few centuries ago. In many respects the new shop is an absolute antithesis to the modern idea of shop design; it is also an antithesis to the ferocious modern idea of advertisement. Yet, from its very existence we may infer that it is confidently expected to fulfil efficiently the function of both shop and advertisement. The influence of this new-style "painted sign" on future commercial building and on advertisement should be interesting to watch. It is surely significant that the building has aroused the interest of a section of the public perhaps not usually interested, and also that many people who came to scoff have remained to admire.

Headstone at Norton, Letchworth. MR. ALLEN FOXLEY, Architect.

[This headstone, in Ancaster stone, was made by Mr. W. Aumonier.]

GENERAL NEWS

Professional Announcement.

After June 20 the address of Mr. Max Clarke, F.R.I.B.A., will be 25, Castlebar-road, Ealing, W.5; telephone, Ealing 584.

Architect's Estate.

Mr. William Dunk, of Mount Park-road, Ealing, W., and of Billiter Square-buildings, E.C., architect (net personalty, £4,589) left £5,685.

The Fine Art Society.

An exhibition of the works of Ivan Mestrovic, the Yugoslavian sculptor, consisting of about thirty pieces, either in marble, bronze, or wood, will be held at the Galleries of this Society towards the end of this month.

The A. & S.A.P.U.

On June 28, the Architects' and Surveyors' Assistants' Professional Union will pay a visit to the Braintree Works of the Crittall Manufacturing Co. On the same day a visit is to be paid to Wembley, when Sir E. O. Williams will read a paper on "Concrete Construction in the Exhibition."

Danish Sculptor's Exhibition.

Queen Alexandra has given her patronage to the Exhibition of the work of the well-known sculptor Professor Utzon Frank, of Copenhagen, which is to be held at the Leicester Galleries, Leicester-square.

The Danish Minister, Count P. F. Ahlefeldt-Laurvig, will open the Exhibition on June 26, at twelve o'clock.

Open Space for London.

The Corporation of the City of London has received from Sir Henry Lennard (chairman of the Town Planning Committee of the District Council), of Wickham Court, Kent, the offer of nearly 38 acres of woodland for preservation as a public Open Space and Nature Reserve. As the guardians of the West Wickham Common, it rests with the Corporation as to whether or not they accept the gift.

Ex-Officer Architects.

On June 12 the League of Officers held a meeting at the Mansion House for the purpose of making an appeal to employers and the public in general to support the League. The Lord Mayor presided.

After the Lord Mayor had opened the meeting Sir Roger Keys said there were hundreds of ex-officers, many of them with the highest qualifications, on the books of the League, including men of the legal, medical, and architectural professions. In some cases men had only just commenced training at the commencement of war. At its conclusion it was extremely difficult, in some cases, for the men of these particular professions to continue their studies. If employers would try them, they would find them endowed with such qualifications as the power of organisation, devotion to duty, ability to assume responsibility, and possessed of enthusiasm, willingness, and reliability. He made a special appeal for employers to give priority to the claims of ex-Service officers.

Major-General S. S. Long, Rear-Admiral Sir Guy Gaunt, M.P., Mr. Cecil Rowntree, who proposed a vote of thanks to the Lord Mayor, and Rear-Admiral J. G. Armstrong also spoke.

COMPETITION NI

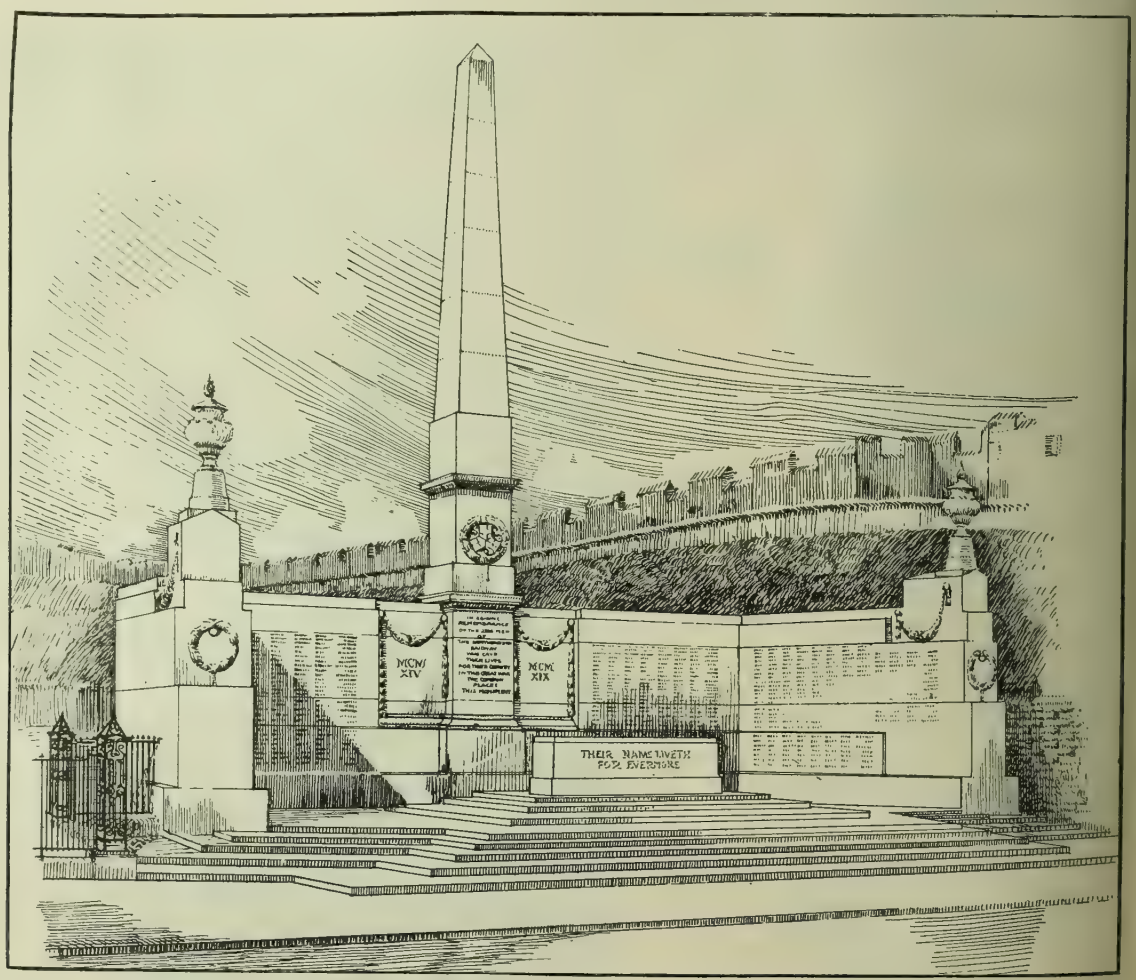
Portstewart War Memorial.

The design by Messrs. J. Robinson Belfast, has been selected in this com The cost is estimated at £750.

Gosport Central School.

The Education Committee has prov accepted the design of Mr. L. M. Field f Central School at Gosport.

Brancepeth Miners' Welfare Sche



The design of Messrs. Hayes & AA.R.I.B.A., has been placed first in a competition for the Brancepeth Miners' Scheme, Willington, Co. Durham. Th the scheme is approximately £18,000.

Other Competitions.

Other competitions still open incl following (the dates given are, first the in date, and second the issue of *The B* which full particulars were given) :—In Designs (June; Dec. 21, 1923). Ro Memorial (Sept. 30; Feb. 21). Glasgo Hall (July 4; May 2). Harrogate I (Sept. 30; May 30). Bexhill Entert Hall (Sept. 1; May 30). Hamilto Memorial (Sept. 1; May 30). Glasg School Memorial (Sept. 30; June 13). Memorial (Aug. 23; June 13).

Royal Institute of British Architec

The Royal Institute of British A has published a list of books recomme students. Copies of the list may be c free on application at the Royal Institu

North-Eastern Railway Company Memorial, York. SIR EDWIN LUTYENS, Architect.

[This monument, unveiled on June 14, has been erected from the designs of Sir Edwin Lutyens, R.A., F.R.I.B.A., and under the supervision of Mr. Stephen Wilkinson, A.F.C., F.R.I.B.A., Architect to the Company. The masonry screens are 15 ft. high, and the obelisk 54 ft. The flanking screens are set slightly splayed on plan. On the internal faces of the screens are carved the names of 2,236 men of the R The entire structure is in Portland sto total weight being over 1,000 tons; the l stones in some cases weigh as much as si

THE ROYAL SCOTTISH ACADEMY

E 98th Annual Exhibition of the Royal ish Academy opened a few weeks ago dinburgh. The Exhibition has been ged on the same lines as in former to show to the public the standard trend of Scottish art in painting, ture, and architecture, and while the us works of art maintain a very high ard, yet to the casual visitor one of supreme importance seems to be ing in many of the exhibits, excellent gh these may be.

r a Scottish Exhibition one would ex- the predominant note to be Scottish. udent of Scottish character would ally expect to see a portrayal of all is best in the national life and senti- s of the people, and to receive an ession of that strength of mind and n of character which have made Scots- famous the world over. But the ed grandeur of the mountains, the depths of the lakes, the massive piles e castles, while still potent influences ational character, are not predominant res of the Exhibition this year. Ex- nt indeed, however, are many of the s of sculpture. The group "Abun- e," by Professor Derwent Wood, which ls in the centre of the hall, opposite staircase, is well worthy of the im- nt position it occupies.

rhaps the most attractive exhibit in sculpture section, however, is "The e," a group of two nude dancers d back to back, by George William sen. This group has been honoured he Guthrie Award, and is certainly a ning study, and induces the critic to the name of this promising young tor. "The Hoop," by the same , is also excellent.

o strong exhibits, "Romance," and George," by Gilbert Bayes, though in scale, recall to the mind the hts Templar and deeds of daring in gone by.

small group, "Madonna and Child." . Reid Dick, portrays the theme in st original light. The delicacy of the lling, the arresting charm, and the l it makes to the æsthetic sense, ate in no uncertain manner the quality r. Dick's work. "Mary" and "The Caroline Paget" are also fine ex- es by the same sculptor.

e draped figure, "Charity," holding a naked child against the broad masses of sweeping garments, makes this little statuette by Alfred Gilbert quite a notable achievement.

A fine bronze of "Sir Rowand Anderson," by Dr. Pittendrigh Macgillivray, destined for the Scottish National Portrait Gallery, attracts a good deal of attention.

The "Eton Statue," by Sir Bertram Mackennal, arrests the attention at once. This figure of a finely formed youth stepping out with upraised arms to offer himself altogether in his country's service tells its story in a most affecting way, and appeals strongly in the intellectual sense rather than in the sculpturesque technique.

While the foregoing are perhaps the main exhibits of interest in the sculpture section, excellent work has also been submitted by Messrs. Gamley, Hartwell, Portsmouth, Alex. Proudfoot, George Henry Paulin, and others.

The architectural section, from the architect's point of view, is certainly the most successful in bringing before the public many excellent specimens of modern work on a really grand scale. This section is strengthened greatly by some splendid drawings of prominent buildings in London, such as "Adelaide House," by Sir John Burnet, and "New Offices of the Anglo-Persian Oil Co., Finsbury Circus," by Sir E. Lutyens. "New Buildings, Piccadilly," by H. Austen Hall, is an outstanding exhibit.

Two fine examples of the work of Herbert Baker command attention: "Secretariats from Upper Court, Delhi," and "The Foreign Office Block, Secretariats, Delhi." The drawings are by W. Walcot and J. F. Wilson respectively, whose airy style of rendering gives relief to many of the rather ponderous pen-and-inks.

The Glasgow architects are again well represented by James Miller, Watson, Salmond & Gray, Stewart & Paterson, A. N. Paterson, Campbell Mackie, John Arthur, and Sir John Burnet, all of them submitting illustrations of work which is certainly a great credit to themselves, and bears testimony to the quality of designs being produced by the modern architect.

The Edinburgh School is prominent as formerly. James B. Dunn is perhaps the most outstanding of this school. The "War Memorial at George Heriot's School, Edinburgh," is strong in detail, the symbolical figure on the top of the monument—"The Pelican feeding its Young"—was modelled by Miss Phyllis Bone, and, along with the rest of the carving, was carried out by Alex. Carrick, A.R.S.A.

Other prominent Edinburgh exhibitors are William Davidson, R. S. Reid, Richardson & M'Kay, Reginald Fairlie, T. Aikman Swan, Andrew W. Lyons, H. O. Tarbolton, Messrs. Orphoot, Whiting & Bryce, and William Ogilvie.

The architectural section is really excellent, though the number of exhibits is essentially limited. The sculpture section, too, is good, but also very limited.

The quality of the oil paintings, water-colours, drawings, and prints, which occupy most of the space in the Academy, whilst in some respects brilliant, yet in the main is rather disappointing.

The impression on the mind as one leaves the building is that the artist has not risen to the heights that one would expect to see in the Royal Scottish Academy. The Scottish visitor who received a whiff from "the braes of broom and heather," a glimpse of the rude rocks or border towers, would feel an irresistible appeal to the imagination. The same fire and fervour that inspired the genius of Burns in his poems ought to be more evident in an exhibition of Scottish art.

In view of the fact that in two years the Royal Scottish Academy will celebrate its centenary, and that such an occasion should call forth the best efforts of everyone to crown with success the century's work, it is to be hoped that something more distinctive, more characteristic of Scotland and Scottish art, may be produced. Scottish artists in days gone by have produced works which have been the admiration of succeeding ages, and which reveal the characteristics of the national style, but modern artists would appear to dilute their work with ideas from foreign schools, to the weakening of the chief features of the Scottish Doric. This departure is to be deplored from a national standpoint. If our schools and colleges were approached and encouraged with a properly organised incentive, it is certain that many specimens illustrative of purely Scottish influence and vigour could be obtained, and then the success of the centenary of the R.S.A. would be assured, and Scottish art, free and untrammelled, once again reach its proper position in the world of art in general.

Royal Scottish Academy Exhibition, 1924.

Edinburgh Academy War Memorial. MR. R. S. REID, Architect.

CORRESPONDENCE

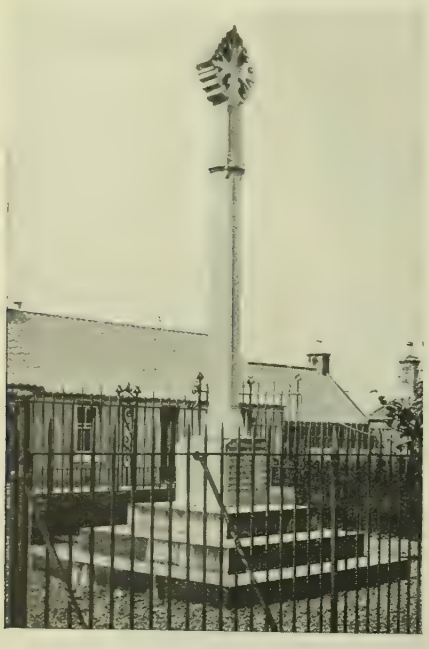
Mr. Wheatley and the Building Industry.

SIR,—Who can question the leading article in your last issue? But Mr. Wheatley is not responsible for the rent restriction Acts, and *all political* parties favour State-aided housing. The strain of the war has paralysed the reasoning power of the people But the degradation of politicians outbidding one another has much to answer for. The "refreshing fruit," the 9d. for 4d. touch, is an indication of degeneracy permeating all ranks of society.

At great cost in money and effort we are distributing comparative poverty instead of creating wealth. Parasitism is rampant. We fail to distinguish between work and work. We may work hard producing nothing, and we may work hard creating wealth. Our efforts are too much engaged on the former, and hence the distress and poverty. In any case, there will be few houses because there is no margin of wealth from which to create them. One could easily elucidate the causes of the present stagnation of industry and consequent unemployment.

A. HENTHORN STOTT.

Housing Costs.



SIR,—Messrs. Chas. Heathcote & Sons, in your issue June 13, give some figures of a scheme of housing finance they propose as an alternative to Mr. Wheatley's.

Several questions occur to me in considering their scheme.

(1) They give the capital expenditure as £500, including drainage. Do they include sewers and roads? (2) In revenue account they include on debit side ground rent, 10s. Do they propose to erect cottages on leasehold land?

Ten shillings per annum is 5 per cent. on £10, and 12 houses to acre would make the cost of land £120 per acre, or if 15 houses are allowed, £150 per acre. Under the Land Acquisition Act land has been obtained at £180, but there are very few districts where it will be possible to obtain it at £150 per acre. But this is a small matter comparatively.

To provide three-bedroom parlour cottages, inclusive of roads and sewers, for £500 will mean building at 8d. per ft. cube, or less, varying with cost of roads and sewers. With goodwill this should be easily done if all parties concerned unite to give best possible output; but not under present conditions.

Balgonie Colliery War Memorial.
MR. WILLIAM DAVIDSON, A.R.I.B.A., Architect.
MR. H. S. GAMLEY, R.S.A., Sculptor.

But I think Messrs. Heathcote will find that they have underestimated the cost of maintenance and management; the former is not likely to be less than 1½ per cent. on capital expenditure, nor the latter less than ½ per cent. (practically 15 per cent. and 5 per cent. on gross rentals). These charges would be £10 instead of £3 4s., an addition to outgoing of £6 16s. To this £6 16s. must be added, say, 2s. only on ground rent and £5 2s. on rates, because reduction will not be given. You cannot take advantage of the subsidy and ask for a reduction in rates at the same time. On the credit side of revenue account Messrs. Heathcote have taken into account the amount they think the average subsidy will be under the scheme. They fix rent at 12s. 6d. to show a profit of 7½ per cent., but comparatively few workers can afford to pay 12s. 6d. per week. Even if one-fourth of income is paid in rent and rates, only those in receipt of 50s. per week assured income can pay 12s. 6d., and the average worker has neither 50s. per week nor any assurance of its regular payment, while the man requiring three bedrooms cannot afford to pay one-fourth income in rent.

To work Messrs. Heathcote's proposed scheme the figures, I think, would be as follows :—

	£ s.		£ s.		£ s.
*Ground Rent	12	*not*	10	†Subsidy	11 0
Insurance ..	6		6	Rent ..	32 10
Repairs, &c..	7 10	*not*	2 10		
Management	2 10	,,	14		
Rates ..	7 2	,,	2 0		
	£18 0	*not*	£6 0		£43 10
				Less outgoings ..	18 0
					£25 10

Or 5 per cent. instead of 7½ per cent.

To continue the analysis of Messrs. Heathcote's figures, I think they should be :—

	£ s.		£ s.		£ s.
Outgoing as before	18 0	*not*	6 0	Rentals ..	32 10
£400 at 4 p.c...	16 0		16 0		
£100 at, say, 6 p.c.	6 0		—		
SinkingFund at 5 p.c. to repay £500 in 40 years	4 3	*not*	3 7	Loss ..	11 13
	£44 3	*not*	£25 7		£44 3

If I may say so without offence, Messrs. Heathcote have not grasped the position, which would be as follows, accepting costs as given above :—

	£ s. d.
Land at £150 per acre per annum, 15 houses to acre	10 0 0
Cost of building, with roads and sewers..	500 0 0
Capital expenditure	£510 0 0

REVENUE ACCOUNT.

	£ s.		£ s.
£110 at, say, 6 p.c.	6 12	Subsidy	13 10
£400 at 4 p.c. ..	16 0	Rent required (say, 11s. 9d. per wk.)	30 13
Insurance ..	6		
Repairs	7 10		
Management ..	2 10		
Rates	7 2		
Sinking Fund ..	4 3		
	£44 3		£44 3

In proposals I have submitted to Minister of Health, instead of a subsidy of £9 per annum for 40 years, I suggest that the Government should provide capital at 2½ per cent., capital and interest repayable in 60 years, created by Housing Loans at 4 per cent., capital and interest repayable in 40 years, reducing rent charge £6 per annum. The loss of 1½ per cent. in first 40 years would be more than written off by the receipts for 20 years after liability had ceased. By this means the State would lose £6 per annum per house for 40 years, and gain £10 per annum for the next 20 years, instead of giving a subsidy of £9 for 40 years.

*In all Municipal housing schemes the freehold of land will, of course, be secured.
†It will be probably found that the maximum subsidy of £13 10s. will be the average.

By Poor Law and Rating reform I think charge on rent might be reduced by about

Sinking fund charges would be reduced £3 5s. by the repayment of capital and int over the 60 years on Housing Loan, leaving private capital to be repaid by sinking fund

A further saving of 15s. per annum w be saved by local authorities undertaking and sewer charges as their contribution ins of finding a subsidy of £4 10s. per annum 40 years; 15s. being 5 per cent. on £15 house, 15 houses to acre, making developn charges of £225 per annum.

The savings are as follows :—

On capital	£6	0	0
,, rates	3	0	0
,, sinking fund	3	5	0
,, roads and sewers ..		15	0
	£13	0	0

by	13	0	0
leaves	£31	3	0

as the required rental—say, 12s. per week no cost to the State in the long run, and a cost of £15 to £30 to local authority for ro and sewers, instead of an annual subsidy: t is, at a cost of 15s. to 30s. instead of £4 per annum.

The local authority by rating and Poor L reforms could be relieved of, say, two-fifths present burden of rates, and the Exchequ could be compensated by tax on land val unearned increment. JOHN E. YERBURY.

SIR,—Messrs. Charles Heathcote & So letter on housing is very interesting, but amount allowed for repairs, management, & is far less than would be required in pract while such items as irrecoverable arre empties, and sinking fund are entirely omitt Also no provision appears to have been m for the cost of forming roads and laying sewers

Again, considering a safe 7 per cent. can obtained from debentures, I cannot think t any private investor would be content with same return on the equity of cottage prope I doubt if even 15 per cent. would be attracti and should suggest a better balance sheet a £500 house would be as follows :—

	£ s. d.	£ s.
Interest, etc.:		
Ground rent, ½ acre at £200 per acre, forming roads and sewers, say, £45, or equal to £4 per annum	4 0 0	
£400 advanced by Government at 4 per cent.	16 0 0	
£100 equity at 15 per cent. ..	15 0 0	
		35 0
Rates:		
Local rates, 14s. in the £ on, possibly, £15 assessment ..	10 10 0	
Water rate, say	1 10 0	
		12 0
Expenses:		
Insurance 1s. 6d. per cent. on £500	7 6	
Sinking fund	1 10 0	
Empties and arrears (average two weeks)	2 10 0	
Repairs and management ..	7 12 6	
		12 0
Total outgoings		£59 0

Equal to a rent of over £1 2s. 6d. per week.

I consider this the minimum rental, as allowance for expenses is only 20 per cent. the gross rental, or 25 per cent. of the net rer after deducting rates. After the first ten ye I doubt very much if it would be sufficient.

J. C. TICKLE

Menai Bridge.

SIR,—In the recent correspondence I mer questioned the wisdom of destroying and repairing Telford's Bridge. If the fairway navigation (about 550 ft by 100 ft.) is necess I doubt the suitability of the site for a fer concrete bridge.

As showing my belief in ferro-concrete c struction, may I point out that I have recen designed a ferro-concrete (industrial) roof 180 by 120 ft. span (no pillars)?

A. HENTHORN STOTT

E PROPOSED AMALGAMATION

PECIAL general meeting of the Royal ute of British Architects was held at n Hall on Tuesday " for the purpose of ering, and, if thought fit, passing the ned resolution No. 1, and also for the se of considering, and, if thought fit, g the subjoined resolutions Nos. 2 and pectively, approving with or without cations the draft Supplemental Charter ew by-laws which will be submitted to eeting. Should the resolutions be passed e requisite majority they will be sub- d for confirmation to a further special al meeting to be subsequently convened.

" Resolutions

1) That this meeting hereby approves, s and confirms the Provisional Agree- for amalgamation, dated 29th May, made between the Royal Institute of sh Architects and the Society of Archi- produced to the meeting, and for the ses of identification initialled by the dent, and directs the Council of the In- e to carry the said agreement into effect.

2) That this meeting hereby approves of raft Supplemental Charter contained in rinted document produced to the meeting, or the purposes of identification initialled e President, and authorises and directs Council to take the necessary steps to n for such Supplemental Charter the ap- l of His Majesty's Privy Council.

3) That this meeting hereby approves dopts the new by-laws contained in the d document produced to the meeting, and e purposes of identification initialled by resident, and authorises and directs the il to take the necessary steps to obtain he new by-laws the approval of His sty's Privy Council. And that the exist- y-laws be rescinded immediately after approval has been signified."

hundred and seventeen members were nt.

Letter from the Defence League.

opening the meeting MR. J. A. H (President), who occupied the chair, before calling on Major Barnes to move rst resolution, he would ask the Secre- o read a letter received on the previous g from Mr. H. W. Wills on behalf of efence League.

letter was then read, as follows:—

" 16th June, 1924.

the President and Council of the Royal Institute of British Architects.

entlemen,—The ' Defence League ' has ed and the ' Emergency Committee ' pproved of the following agreement to the differences which have arisen, which hoped the Council will confirm and re- end to the special general meeting for ance:—

1) That the Council's recommendations e allowed to pass the general meeting ne 17th and the subsequent confirming g without opposition from the ' Defence e ' provided that, immediately after the tions have been passed by the general meeting on June 17th, the Council forthwith hold a referendum on these resolutions by postcard vote of corporate members in the British Isles.

" (2) The postcard vote to be a direct vote in favour of or against the resolutions.

" (3) The referendum to be decided by a simple majority of those actually voting.

" (4) Neither the ' Defence League ' nor the ' Emergency Committee ' to send out circulars or otherwise to carry on propaganda in favour of or against the resolutions while the postcard vote is being taken.

" (5) If the resolutions are rejected by the postcard vote the Council will ask the confirming meeting to drop the proposals altogether.

" (6) The ' Defence League ' as a body and the members of its Committee who signed the proposed undertaking on June 10th will undertake:

(*a*) Not to oppose the Council's proposals before the Privy Council.

(*b*) To disband the ' Defence League ' and not to revive it within five years.

(*c*) To drop all idea of the formation of a rival society on this issue.

" (7) The ' Emergency Committee ' will undertake to disband itself and not to revive it within five years.

" Yours faithfully,

" (Sgd.) HERBERT W. WILLS."

The President said that letter was a very important contribution because it showed and opened a way to a complete reconciliation within the Institute and those conflicting interests which had rather distracted their attention of late years. The Council felt, and had felt, that in view of the result of the recent Council election they would have no hesitation in proceeding in the ordinary way to get the resolutions passed. But their desire was not to act with a high hand and to make use of the forces at their disposal provided another course appeared which would help to bring harmony into the Institute. The Council had considered the proposal, and an important point was that the Society of Architects had been acquainted with the suggestion and were entirely willing to leave it to the Institute, so there was nothing to hinder the proposed vote. They would fully understand, as had already been explained to the members, that the postal vote in itself had no legal force. At present the only way in which changes such as those proposed could be carried was at a general meeting such as that that afternoon, and where they had to be carried by a majority of two-thirds. They would also be aware that one of the proposals embodied in the letter before them was the establishment of such a postal vote, but at present they would realise it had no legal force. At the same time it did give an opportunity for every member of the Institute to record his vote, and it would remove any objection which might be raised on the score that many members had had no opportunity of attending the meeting that afternoon. Therefore the Council was very anxious that they should agree to the taking of the postal vote, and urged them to do so with all the persuasion at their command. That day it would be necessary, no matter what happened, to put the resolutions to the vote and to carry them by a two-thirds' majority, if they were to be carried. But although the Council hoped and felt confident that the resolutions would be carried they would submit the resolutions to the ratification of the postal vote. If the postal vote were favourable then the confirming meeting would be held at which it would only be necessary to have a bare majority. If the postal vote were not favourable, the confirming meeting would still probably have to be held, but in that case the Council would advise the meeting not to confirm those resolutions. But they hoped that course would not be necessary. The proposals put forward by the Defence League were submitted to the Council in conjunction with the Conference of Presidents of Allied Societies, and they were received with acclamation. He thought it would clear the air and get them on the way in a smooth manner if he asked the meeting to indicate whether or not it approved of the proposals embodied in the letter of the Defence League.

On being put to the meeting these proposals were unanimously agreed, and the PRESIDENT said that as there was no doubt as to the feeling of the meeting he would undertake on behalf of the Council to abide by the terms of the letter.

Resolution No. 1.

MAJOR HARRY BARNES, after moving the following resolution:—" That this Meeting hereby approves, ratifies and confirms the Provisional Agreement for amalgamation, dated May 29, 1924, made between The Royal Institute of British Architects and The Society of Architects, produced to the Meeting, and for the purposes of identification initialled by the President, and directs the Council of the Institute to carry the said Agreement into effect," said he did not consider it necessary to go into the details of the Agreement as it had been circulated to every member present, and was, no doubt, perfectly familiar to everyone present. But it was necessary to say a few words in support of it, because, as the President had already indicated, everyone who spoke was speaking to a larger audience than that present, because the result of the meeting was to be confirmed by a vote taken by means of a written communication. He thought they were in the pleasant position that afternoon of being able to perform the happy task of ending the divisions between the Institute and a considerable section of the architectural profession. One of those divisions had lasted forty years. It began when certain members of the Institute founded the Society of Architects for the purpose of aiding the cause of Registration. He did not know if any of the original members were living, but if so they were in the proud position of seeing their cause become the cause of a united profession. By ratifying the Resolution they would bring back to the Institute a numerous progeny in the wilderness. What had been achieved was largely due to the efforts of Mr. Maurice Webb. There seemed every prospect of ending a division of some four years of a most acute character between that section of the Institute which had, since the formation of the Defence League, been opposed to the principles embodied in the agreement they were now asked to approve. It had been for every member of the Institute, equally with the Defence League, a source of great sorrow that for four years the Institute had been divided. They all wanted to get out of the way everything that prevented them being united. The present meeting held out the prospect of that achievement. Before outlining the considerations that had moved the Council's policy, he would touch upon the point as to why they declined to take a referendum before the Council election and why now. They felt that they were, as a Council, so identified with a policy that they would not be doing justice, either to the profession or themselves, by separating themselves from it. They would remember that about three years ago there was a Council in existence which came before the profession with a policy which did not prove to be acceptable; they were swept away. The present Council felt they were elected for the express purpose of finding a way out of the difficulty. They had asked to be elected with that motive. They had spent a year in trying to find a policy and were identified with it. They had nailed their colours to the mast and if they had to go down, would go down with flags flying. They came identified with this policy, and asking to be elected because they wanted to carry it out—they had been elected. Now they had been approached that they should accept a suggestion, of which, in itself, they had never been afraid, a suggestion which, if accepted, would be a bridge along which the Defence League and the Emergency League might join a united Institute. It was an entirely different proposition. They

were asked to do something relating to the question of getting a united profession. On that ground they felt they could accept the proposal ; not out of weakness, but out of strength. As the Council saw it the issue was a proposal to amalgamate with the Society of Architects and was a proposal which arose directly out of the question of Registration. Registration became an issue forty years ago. Some twenty years ago the Institute practically adopted the idea. It was correct to say there were no more urgent supporters of the cause of Registration than the principal members of the Defence League. Registration was a common ground for all. The only question was how to get it. Immediately it was agreed that Registration ceased to be a ground of controversy, the only question—but a vital one—that remained was, if they were going to have Registration it implied they must have someone to control it. Two years ago he put before the Cardiff conference the position as he saw it, *i.e.*, if they were going to have Registration the body to control it must be one of two kinds. If they did not amalgamate with the Society of Architects they must put up some outside body. And that body which was not connected with either of the other bodies must control both. But such a body must be supreme and control the other two. That was one kind of body they might have. On the other hand, they might, if they carried out the policy of amalgamation, have the Institute itself the controlling body—without any party above it—the Institute holding and maintaining the supreme position. He suggested it two years ago—one thing or the other. Then a week or so after that speech the Council was turned out of office, and a new Council, elected by the Defence League, came in. It enabled the Defence League to put forward their proposals for dealing with the situation. They had to choose between amalgamation or setting up some other body. That was the problem that had to be faced, and a solution embodied in the appeal which came before the Institute a year ago. One of the two positions had already been rejected. Another Council had been elected to find some other way. There were only two ways to go, and one closed. It did not require a great deal of foresight to see only one way open. That way was the one which the Council had taken. The position with regard to Registration involved a controlling body ; there were only two positions. One had been rejected ; they were now asked to adopt the other. If the meeting should reject the proposal the Council had passed it would close both ways and put Registration out of practical politics. If they wanted Registration they must go either one way or the other. The meeting wished to give Registration a push ; but they wanted above all other things to see the Royal Institute of British Architects remain in its supreme position, not only as the head of an incorporated section of the profession, but as the head of the whole profession. They not only wanted a great profession, but also a supreme Institute, and he therefore moved the Resolution with great confidence.

In seconding the resolution, MR. MAURICE WEBB said he really had nothing to add to what Major Barnes had said, but he would like to emphasize two points. One was that while the amalgamation would not bring about immediately registration by Parliament it would bring immediate registration by Charter. Directly the amalgamation was complete it would be possible to proceed with obtaining Parliamentary registration ; amalgamation was an essential step towards registration by Parliament. The second point was, he was inclined to think, even more important. It was that they would at last attain the ideal which two or three generations of architects had been working for, namely, one great united Institute with Allied Societies throughout the kingdom. Hitherto they had been a house divided against itself. They had two societies in London, sometimes pulling together, sometimes pulling in opposite directions. If the proposals before that meeting were passed that state of affairs would be ended. He did not think it would be considered inappropriate if he said the agreement now possible was very largely due to the attitude of the Society of Architects. The Society had been asked to bury themselves and to exterminate their society, and that was a pretty tall order. Throughout the amalgamation negotiations the Society of Architects had worked for the good of the profession just as much as the Royal Institute, and he hoped those present would realise that. The Emergency Committee fought pretty hard to try to stop the Defence League's obstructing proposals against what the Emergency Committee considered for the benefit of the profession. He was told that some very hard things had been said about the Emergency Committee ; and the Emergency Committee had probably said some very hard things about the Defence League. But in view of the compromise reached at the beginning of that meeting his colleagues on the Emergency Committee wished him to say that for their part there would be no bitterness left ; and when the peace followed the storm the unpleasantness which had taken place during the past few years would, as far as they were concerned, be forgotten.

SIR REGINALD BLOMFIELD said about forty years ago the Society of Architects was founded to further the cause of registration : forty years ago he was a junior member of the Council of the Institute, which at that time very seriously considered a policy of registration. At that time he felt rather strongly on that point, and a group of contemporaries, led by the great figures of Shaw and Jackson, were opposed to registration. Since those days a great deal had happened and the whole course of affairs had changed. He satisfied himself a great many years ago that the profession at large had determined to have registration, and it was quite clear to him that the union of architects was an indispensable step in that direction. Some members of the Institute who, having become members with great pains and labour, did not quite see why the same privileges should be handed over to others. Being but human, that feeling was perhaps quite natural, but he would appeal to them to put the whole question on a much higher plane and make whatever personal sacrifices were necessary in order to bring about that union they all wanted so much. He recollected that during the war architects were ignored as a profession, the principal reason being that they did not speak with one voice. On the other hand, engineers did not suffer from the same weakness, and carried everything before them. If the architectural profession could be united they would receive that prestige and position to which they were fairly entitled. Mr. Webb had said that the Society of Architects were going to bury themselves ; but he did not think they were going to bury themselves at all—they were rather going to bury the hatchet. Many years ago, when he was President of the Institute, a resolution was passed which it was hoped would have settled the matter, but the war knocked all that out, and they had to start again. He congratulated those present on having arrived at a very happy solution, and he hoped in future the Institute would be fully representative of all the architects of the country, and that it would speak with the weight to which it was fairly entitled.

MR. KEPPIE said he did not consider any further discussion was necessary for the adoption of the resolution. The vote in returning the Council had been conclusive. The matter of Registration had been under consideration for many years, and several appeals made, but only now had it a reasonable chance of success. The resolution had given effect to the first serious attempt to bring about unanimity with regard to the Registration Act.

In the North the main difficulty concerning the position of the architect was that after passing serious professional examinations they were in conflict with unexamined men. He believed in Scotland they were whole-hea in favour of the Council's proposals.

MR. H. W. WILLS said although they had to a very happy solution for settling the culty, he would like to make a plain stat of what their position was and had been. Shortt's opinion had little weight with because he asked them to assume two pre They considered that a Registration Bill was supported by two independent p would have the same chance of success a supported by the amalgamation of the bodies. They had obtained opinion fro eminent parliamentary power which supp their view, and if obtained earlier would made a difference to the election. They the welfare of the Institute at heart, and not opposed through any personal spirit, because they considered the Institute making a mistake.

MR. MILLBURN said forty years ago he been asked to promote Registration in North of England. The question of Regi tion had his support in the present Co If they were wrong the vote would go ag them. If they were right it would b eternity of peace.

MR. DELISSA JOSEPH, in addressing meeting, said he had taken with others a active part in the negotiations which ha to the present position. He might have content to remain silent at the present mee but at a recent conference of the Council agreed that it would only be fair that v which did not coincide with their own sh have a medium for expression. It might be inappropriate to recall the motives be the Defence League. They took the view this absorption was dangerous, becaus admitted a large body of unexamined men by weight of numbers, might dominate policy of the Institute. They felt that dilution would effect the prestige of the I tute, and that the absorption, if carried, w reduce the value of the hall mark given by Institute, and constitute a grave injustic a large number of architects whose st would automatically be reduced by dilut With respect to Mr. Shortt's opinion regard to Registration, the Defence Le had, with due deference, obtained the opi of an eminent parliamentary power, and took a diametrically opposite view. He of opinion that absorption was not a sour help in Registration, and that Registra could never be obtained. The point was i trated by the fact that engineers, accounta and others had failed to get Registrat The reason, and the only reason, why doc and nurses obtained Registration was for protection of the public. Parliament only g Registration when the public interest wa jeopardy. Public interest was not in jeopa through the non-registration of archite Points such as sanitation and soundness construction were covered by laws and inspec ship. Nevertheless, the Defence League been in communication with the Emerge League with the result that a happy c promise had taken place at the meeting. result would be the removal of the sense friction and the increased might of the Instit

SIR JOHN SULMAN (Australia) said it a great pleasure to him to be back in country after an absence of twenty-se years, and to see such vigour in the archi tural profession. He came from a S where they had obtained registration, and was a member of the Board which took matter in hand. There was not the slight doubt that registration in that State was v badly needed, and he felt it was going to for the good of the profession as well New South Wales. The other States w following the example of New South Wa and he believed within a few years' time whole of the States of Australia would h obtained registration. He therefore wished urge the desirability of obtaining registrat as soon as possible, because he believed was for the good of the whole professi References had been made to the incorpo tion of the Society of Architects. He wo

o go farther, and express the hope that y was not far distant when there would Royal Institute of Architects of the Empire.

GILBERT H. JENKINS moved an amend- that the words, "subject to the dele- of Clause 4 from the Agreement," led to Resolution 1. Clause 4, he said, to the enablement of Fellows of the te to call themselves "chartered archi- and it seemed to him to be a great hat the only thing they would achieve be to be able to call themselves "char- architects," while still enabling any lified person to continue to call himself rchitect." The whole object of regis- was that they should be able to pre- unqualified people calling themselves ects, and it was for that reason that he ed the amendment.

A. H. OUGH seconded the amendment.

OR BARNES said after all they had got k at the question as a whole. What ere discussing was an agreement which een come to as the conclusion of nearly years' work, and every article of which een most carefully scrutinised. No one have followed the discussion that after- without realising that the Society of ects in entering into the agreement on ide made considerable concessions. No ho had been a member of that Society rty years of its honourable existence have acquiesced in its dissolution with- ry great regret, and in the agreement ociety had made very considerable con- ns over and above what appeared likely ccepted in 1911. The Society had con- that all its Members should go into icentiate class, and no single addition eing made to the Associate class as a of the agreement or the Charter. The attached importance to the point discussion, and he had grounds for be- that a great many members of the te also attached importance to it. If endment were accepted they would be ack on the whole of the agreement, and ally nullify what was in their minds, so inflict a serious injury in the opinion eat many members of the Institute who to see those privileges exercised. He the meeting would not accept the ment.

amendment was then put to the meet- nd rejected by a large majority.

resolution was next put, and passed lly unanimously, only some five or six against it.

Resolution No. 2.

noving Resolution 2, MAJOR BARNES s main purpose was to give effect to eement. In addition to that the Char- ld broaden the whole basis of the con- n of the Institute and establish it more upon a unity of opinion in the profes- It enabled a referendum to be taken, be a valid part of the machinery. It he students a class, instead of a regis- t gave Licentiates rights and voting in the business of the Institute. On er hand, it did not add a single mem- the Associate class, except such as got examination. What it did do was, t left to all Associates the gate wide the Fellowship, it narrowed that gate- everybody else who had not passed an ation; it stiffened the entrance to the ship. and if one were to sum up the thing it was a Charter the object of was to base the Institute upon the will members.

seconding the resolution, MR. H. N BRADSHAW congratulated the Char- By-laws Committee with having, by t resolution, brought registration with- surable distance of attainment.

P. W. HUBBARD supported the resolu- nd suggested it would make a great ce from their point of view of having a united profession if they took other members into the Institute. But the absorption of the Society would not affect the public view of the architectural profession in any vital degree.

This resolution was also carried with only five or six dissentients.

Resolution No. 3.

The third resolution: "That this meeting hereby approves and adopts the new by-laws contained in the printed document produced to the meeting, and for the purposes of identification initialled by the President, and authorises and directs the Council to take the necessary steps to obtain for the new by-laws the approval of His Majesty's Privy Council. And that the existing by-laws be rescinded immediately after such approval has been signified," was then introduced by MAJOR BARNES, and SIR JOHN SIMPSON, in seconding, said they had had a unique meeting, the like of which would not, probably, be seen again. He believed that with the completion of the scheme they would solidify and bring into a single body the whole of a great profession.

After the resolution had been supported by Professor Worthington. Mr. BUCKLAND suggested that the distribution of the representation of the Allied Societies should be somewhat reconsidered.

An amendment of MAJOR CORLETTE to By-law 29, section (*d*) that the words "and an Architect practising in the Dominion which he represents" be deleted was agreed to.

The resolution was then put to the meeting and adopted practically unanimously.

EXHIBITION NOTES

THE SOCIETY OF TWENTY-FIVE.

The Society of Twenty-five Painters have an excellent show at the Fine Art Society, and almost every member contributes something of character and quality; it is one of the best recent exhibitions at this Gallery; the twenty-five are certainly a capable group.

FAKES AT THE BURLINGTON CLUB.

The subject of fakes and spurious imitations has probably never been illustrated in so attractive and interesting a way as at the present exhibition at the Burlington Club. The beautiful productions there assembled fill the gallery with wonderful beauty of form and colour, and we have to realise that though the production of fakes may be a very bad form of work which deserves the greatest reprobation, it has resulted in the creation of many beautiful things which can hardly be said to be inferior to the originals from which they are taken. There are two drawings in the gallery which one is inclined to think offer us very safe ground for affirmation as to which is the real original, and though in another case a panel which was bought for thousands of pounds may have been a bad piece of trickery, it is certainly a very beautiful piece of work. We were inclined to doubt the interest or value of such an exhibition as this when we received our invitation card, but we think very differently now we have seen it, and are inclined to wonder why it has never been done so effectively before. We must all agree that a fictitious and unfair valuation is often founded on the known antiquity of antiquities, and it is perhaps a sort of poetic justice when those who have helped to run up prices so unreasonably are hoist with their own petard.

CORK-STREET GALLERY

The work of Canadian artists at 18, Cork-street, W., coloured woodcuts, etchings, &c, is well worth seeing, for it shows work of outstanding quality. Some of the coloured woodcuts are delightful, and amongst the etchings will be noted some valuable records of vanishing, or vanished, old buildings in Quebec, by Mr. Herbert Raine, who appears to have found a very happy relief from architectural design in etchings, which command a widespread appreciation. Some excellent water-colour drawings by Mr Robert Houston are also on view at these galleries. They are most successful where the most reticence is shown; the tendency to overstatement is one that should be resisted.

THE BEAUX ARTS GALLERY.

One of the best of the minor exhibitions open now is that of pictures by Harold Speed at the Beaux Arts Gallery, in Bruton-place. There are here some of the sort of pictures one could live with and enjoy, whether the subjects be sunny uplands in Switzerland or quiet grey green landscapes in England. The work shown is perhaps more unequal than usual, but at its best is very able and satisfying; seldom is there a lack of breadth which so often spoils clever painting. In this particular the several water colours of Italian lakes by E. Rowley Smart, now on view at the same Gallery, fail to satisfy though the drawings suggest a sympathetic handling of the medium.

THE COTSWOLD GALLERY.

An exhibition not to be missed is that at the Cotswold Gallery, of original engravings and drawings with great names attached to them. The catalogue contains some admirable reproductions of such gems as Turner's "Bourneville" and his "Christ Church Hall, Oxford, from the Staircase." We may get drawings of great cleverness, but we cannot get anything that illustrates the quality of building better than the last-named drawing. We may well recall our goodly heritage amongst the things left us by Cotman, Dürer, Millet, Rembrandt, &c.

Royal Scottish Academy Exhibition.

'e give this week a number of exhibits at year's Exhibition of the Royal Scottish demy.

"Blair Drummond," Perthshire.

Blair Drummond," Perthshire, the resi-e of Sir A. Kay Muir, Bart., was partly royed by fire, and the illustrations we give portions of the internal apartments form-part of the reconstruction. The main idor and staircase were carried out in ish oak. The original house was designed he late Mr. J. Campbell Walker, Edinburgh, he Scotch Baronial style.

he principal contractors engaged on the work econstruction were as follows: Main car-er work, Mr. David Mundell, Stirling; rnal joiner work, Mr. John Cochrane, gow; plumber work, Messrs. J. & J. Duff, ing; painter work, Messrs. Moxon & Car- Edinburgh. The hardwood and principal rnal finishings were carried out by Messrs. t, Morton & Tynecastle Co., Ltd., Edin-gh.

he total cost was approximately £60,000. r. James B. Dunn, A.R.S.A., F.R.I.B.A., burgh, was the architect.

The Institution of Civil Engineers.

he hall of this building measures 100 ft. by 50 ft. wide, and is 50 ft. high. The ng painting, by Mr. Charles Sims, R.A., bolises the part played by Britain in the t War, in which the members of the itution were so prominently identified. picture measures 70 ft. long by 32 ft. wide, is a bold and vigorous work both as regards position and colour. The pilasters and are in coloured marbles, the ornament in former being in gilt toned to an old-gold ur.

he list of contractors is as follows:—General ts: Messrs. John Mowlem & Co., Grosvenor rf, London, S.W.; heating, Messrs. Ashwell sbit, Ltd., Barkby-lane, Leicester; decora-plaster work in Great Hall, Messrs. G. & A. rn, Ltd., 167, Hammersmith-road, London; in entrance hall and staircase, Messrs. nsgrove Guild, Ltd., Bromsgrove, Worces-hire.

r. James Miller, A.R.S.A., F.R.I.B.A., is rchitect.

Municipal Buildings, Glasgow.

he connecting arches between the municipal lings and the new extension were placed at the north and south ends, forming John-street into a quadrangle. The main corridor runs right through between the two tunnels, while there is also a connecting tunnel in the basement under the street. The builders were Messrs. John Emery & Sons, Glasgow; the concrete work by Messrs. Melville, Dundas & Whitson, and the marble floor and interior decoration by Messrs. Galbraith & Winton. The stone used was from Culalloe Quarry, Fife-shire. Messrs. Watson, Salmond & Gray, FF.A.R.I.B.A., are the architects.

Kildonan House.

This house is situated in the valley of the River Dusk, in South Ayrshire. The walls are built of Northumberland sandstone of a creamy-white tone, while the roofs are covered with Caithness stone slabs of a soft grey colour, varying in tone and texture, forming a pleasing contrast with the lighter coloured stonework. The finishings of the rooms are executed in Port Orford cedar, without any stain or varnish, being simply coated with whiting and size, giving a soft transparent grey effect.

The following is the list of contractors:—Mason work, Messrs. J. & D. Meikle, Ayr; joiner work, Messrs. John Cochrane, Glasgow; plumber work, Messrs. Wm. Anderson, Ltd., Glasgow; slater work, Messrs. A. Mackenzie Ross, Glasgow; plaster work, Messrs. George Rome & Co., Ltd., Glasgow; plaster work (2nd section), Messrs. G. & W. Rome, Kilmarnock; tile work, Messrs. Galbraith & Winton, Glasgow; glazier work and steel casements, Messrs. H. Hope & Son, Birmingham; heating, Messrs. Ashwell & Nesbit, Ltd., Glasgow; painter work, Messrs. Charles Carlton & Son, Glasgow; range and grates, Messrs. Wm. Kemp & Co., Glasgow.

Mr. James Miller, A.R.S.A., F.R.I.B.A., is the architect.

George Heriot's School War Memorial.

This memorial was erected to commemorate the former pupils of the school who fell in the war.

George Heriot's Hospital was erected at successive periods from the year 1628 to 1659. The name most frequently associated with the design of the building is that of Inigo Jones.

The memorial takes the form of a Mercat Cross, the lower portion of which is octagonal, measuring 7 ft. across. The chief feature, which rests on the moulded and carved capital of the cross, is a sculptured device of the pelican feeding its young, which was modelled by Miss Phyllis Bone, Edinburgh. The height of the monument above the platform is over 35 ft., the height from the lower level exceeding 40 ft.

The stone of which the monument is built was from Ravelston Quarry, near Edinburgh.

The architect of the memorial is Mr. J. B. Dunn, A.R.S.A., F.R.I.B.A., Edinburgh; the sculptor being Mr. Alex. Carrick, A.R.S.A., Edinburgh.

Carham Hall, Northumberland.

Carham Hall, Northumberland, which we illustrate this week, is the residence of Mr. Arthur Cayley, and is situated on the banks of the River Tweed, about eight miles from Kelso. Extensive additions and alterations were recently carried out. The house was completely remodelled, a new drainage and water supply being introduced.

The principal contractors were as follows: Mason and joiner works, Messrs. Hall & Co., Galashiels; plumber work, Mr. Hugh Weir, Edinburgh; plaster work and ornamental ceilings, Mr. Leonard Grandison, Peebles; electric light installation, Messrs. Cole & Co., Edinburgh.

The total cost of the work, including entrance lodge, amounted to over £35,000.

The architect was Mr. James B. Dunn, A.R.S.A., F.R.I.B.A., Edinburgh.

West Parish Church, Helensburgh.

The interior of the West Parish Church, Helensburgh, has recently been reconstructed, the rearrangement having overcome that sombreness which is apt to characterise so many churches in Scotland.

Prior to this remodelling the organ was placed in the apse, with the pulpit immediately in front of it, but the organ and choir have now been removed to the west gallery and the pulpit has been placed on the north side of the chancel, which has been arranged in more orthodox style and embellished with carving. The pulpit base and the steps leading to the chancel are constructed of white freestone, and the floor of the chancel is laid with marble. The chancel fittings, which are Gothic in treatment, are made of Austrian oak. The pulpit is carved with a symbolical vine *motif*. The communion table and screen are similarly carved, the thistle and rose being introduced into the tracery. The lectern, which is placed on the south side of the chancel, stands on an oak base, and is carved in the Gothic style. The font, with its base of white freestone, is treated in a similar manner.

The architects were Messrs. Stewart & Paterson, 16, Blythswood-square, Glasgow. The construction and carving of the chancel fittings were carried out by Messrs. John Crawford & Co., Glasgow.

London County Council Housing.

In order to facilitate development the work at the L.C.C. Estate at Becontree has been divided into sections. The first of these (Ilford No. 1), with 2,901 houses, was completed in July, 1923, and the second (Dagenham) is well advanced. A third section, with 996 houses, has been commenced, and further development (1,000 houses) is about to be commenced to the east of the first section.

The illustrations which we publish are of houses on the second section.

It is situated at the south-eastern corner of the estate, and covers about 60 acres. Of the 990 houses to be provided, 633 are completed and the remainder are being rapidly finished. All the houses are constructed in brick. The types are as follows:—Five rooms, 201; 4 rooms, 248; 4 rooms (parlour), 213; 3 rooms, 276; 3 rooms (flats), 32; 2 rooms (flats), 20. Total, 990 cottages and flats, providing accommodation for between 7,000 and 8,000 people. Broad-street, an existing road, has been retained, together with the trees and hedges bordering it.

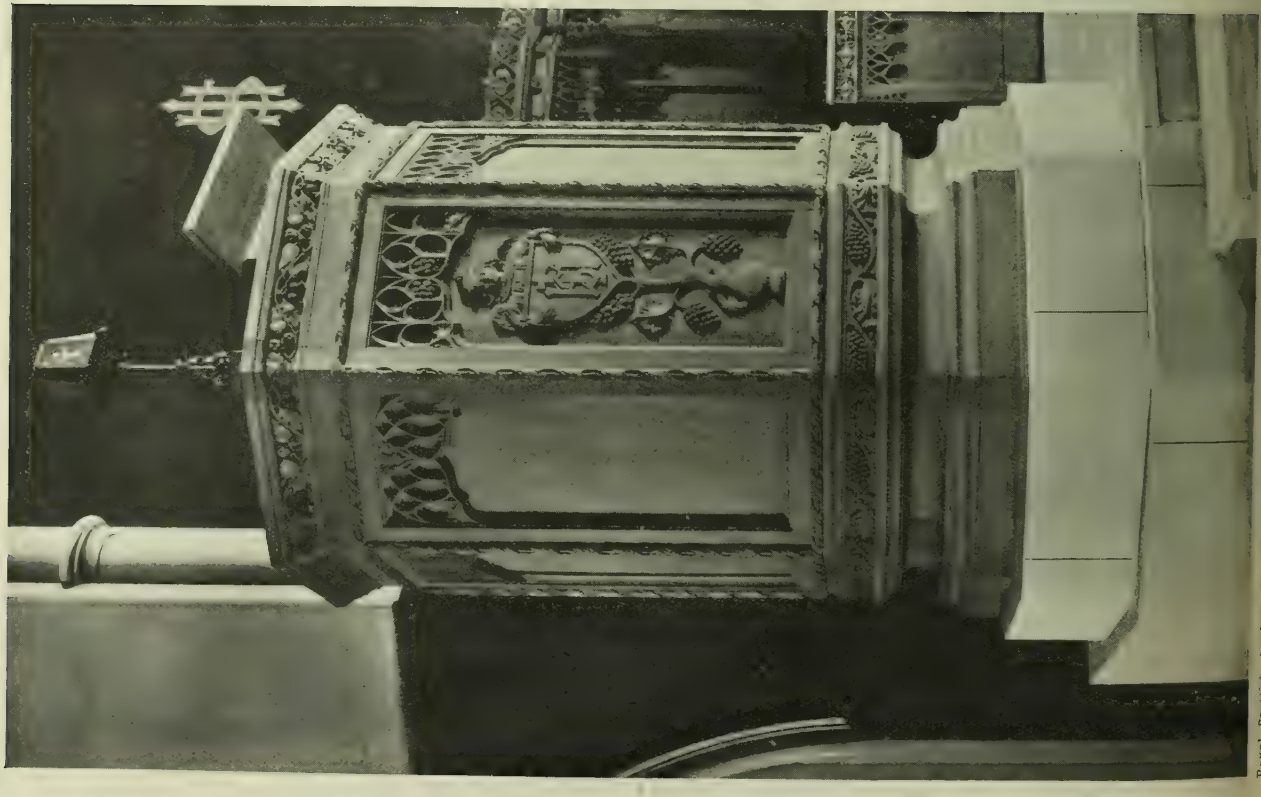
Mr. G. Topham Forrest, F.R.I.B.A., the Architect to the Council, is responsible for the lay-out of all sections of the estate, and also for the design and construction of the houses.

MEETINGS.

FRIDAY, *June* 20.

Town Planning Institute.—The Annual Meeting will be held at 6 p.m., at 92, Victoria-street, Westminster. Mr. R. Bruce will read a paper on "The Model Clauses—General Convenience and Amenity."

MONDAY, *June* 23.



Royal Institute of British Architects.—Mr. C. A. Daubney on "The Proposed Reform of the London Building Laws," 4 p.m. At 9, Conduit-street, W. 1.

Architecture Club—Visit to British Empire Exhibition

THURSDAY, *June* 26.

Society of Antiquaries.—Report on the excavations at Richborough by Mr. J. P. Bushe Fox. At Burlington House, Piccadilly, W. 1. 8.30 p.m.

PROPOSED AMENDMENTS OF THE BUILDING ACTS

By W. R. DAVIDGE, F.R.I.B.A.

London Building Acts, under which our day London has grown up, are still as nderstood by the average Londoner as is eek Testament, and even the architect ilder who have to deal with some of the ons of the Acts every day of their lives adily admit that the best and simplest o keep clear of trouble is on each and ccasion to consult the District Surveyor, n be relied upon to keep them clear of ny pitfalls which beset their path.

London building laws have a continuous of at least seven hundred and thirty- ars, for it was as long ago as 1189 that esent party wall provisions of the Acts their commencement. The succeeding es have slowly added fresh legislation, hough from time to time the enactments een codified into one Act, as under the olitan Building Act of 1855, the law g building in London is still being added ost year by year. No other city in the has so many and varied problems as n, and it is probably true that in no other the building law administered with such anded justice, so that the London g laws have become a model for cities, nd small, all over the Empire.

last codifying Act was thirty years ago, he London Building Act of 1894 brought date the then existing legislation, and hen numerous amendment Acts dealing scape from fire, steel frame buildings, on, have been placed on the Statute The L.C.C., by their various General Acts, have sought to deal with the s problems as they arose, but it has been s for some years that a further codifica- the London building law is long overdue. building laws which were sufficient to deal ie London of thirty years ago are in many nadequate to deal with the problems of esent day, and the necessary revision be long delayed. The labours of the l Committee set up by the R.I.B.A. to er and report upon the proposed reform London building law will, it is hoped, seful fruit. There will, of necessity, be points of difference among architects as ters of detail and it is satisfactory to note ie R.I.B.A. have set aside the next two ys, June 23 and June 30, for a full ion of the many problems involved in eport of the Committee.

Committee have gone in careful detail he present Acts, and the innumerable tions which have been made from time e for their modification. The Committee actically unanimous in their opinion that London Building Act of 1894, together s amending Acts, have become so involved, so many respects are inapplicable to t-day conditions, that it is essential for dequate conduct of architecture and ig in the County of London that these hould be forthwith simplified, amended onsolidated." The Committee's recom- tion has been accepted by the Council of stitute, and the L.C.C. have invited the A. to forward their recommendations, g them that these shall receive the consideration. It is therefore to be that all architects interested will make t of attending the special meetings at the te to consider the proposed reform of ilding Acts.

onsidering a matter so wide in range as ondon Building Acts, it is essential to ide the various subjects, and the Com- in considering some 290 separate items ivided their report under fourteen head- ollowing largely the sixteen parts into the London Building Act, 1894, is d.

headings dealt with by the Committee under :—

The laying-out, widening and altering of and fixing frontages; (2) the height of gs and air space about buildings; (3) construction of buildings and materials used therewith; (4) party wall procedure; (5) special and temporary buildings; (6) dangerous and neglected structures; (7) dangerous and noxious businesses; (8) dwellings on low-lying ground; (9) signs; (10) fire protection and means of escape; (11) special and exempted buildings; (12) administration by the L.C.C.; (13) administration by the district surveyor; (14) miscellaneous.

The Committee have not dealt with the thorny subject of rights of light, thus falling short of the earliest building act (FitzAlwyn's Assize of 1189) which, it will be remembered, laid down that "if any person shall have windows looking upon his neighbour's land, although he may have been for a long time in possession of the view from such windows, and even though his predecessors may have been in possession of the windows aforesaid, nevertheless his neighbour may lawfully obstruct the view from such windows by building opposite to the same or by placing anything upon his own land in such manner as may unto him seem most expedient; unless the person who has such windows, can show any writing by reason whereof his neighbour may not obstruct the view from those windows."

On the subject of new streets and frontage lines the Committee recommend that greater latitude should be given to allow of the formation of crescents where through communication is impracticable, and that facilities should be given for the construction of quadrangles and closes, presumably on the lines already so charmingly adopted in Grays' Inn. The provision that three houses in close contiguity may be held to form a street is generally found to be oppressive, and it is recommended that a larger number than three should be the limit.

From the town-planning point of view, the control of building lines is almost, if not quite, as important as that of new streets, and it is recommended that the L.C.C. should have power to lay down building lines in all streets, new or old. This is a very important recommendation and, although in certain cases, compensation may be involved, it is all important that the London County Council should possess this power, instead of the very limited power which is at present given them to define an already existing line which must be followed. As things are at present, the building line is largely at the mercy of the first comers in a street, and all who come later are to a large extent perforce governed by what has already been done.

The making up of private streets under the Metropolis Management Act, 1855, is in the hands of the various Borough Councils, who can collect the money before they commence work, and it is suggested that there should be some appeal as to the method and materials for making up the street, as there is in other parts of the country under the Private Street Works Act.

It is also curious that the closing of a public way can be effected by Quarter Sessions, on the application of the owner of the land or the local authority, without the L.C.C. being even consulted, and it is obviously only reasonable that the Authority responsible for the laying out of streets should have a say in any application for the closing of a street.

The power of the L.C.C. or Borough Council to prevent building over sewers is also frequently a serious restriction to building, and the Committee recommend that some form of appeal should be allowed from the decision of the authorities.

On the question of height of buildings in London, there has during the past few years been so much controversy that general relief will be felt that the Committee have not unduly laboured this point. They quite rightly point out that in many cases the present limit of 80 ft. in height is much too high on many of our existing narrow streets, and that there are cases where this height should be considerably restricted. Several members of the Committee are well-known exponents of the higher buildings theory, but it is satisfactory to note that the recommendation is comparatively mild, namely, that a height of about 1½ times the width of the street would be a reasonable proportion of height in general cases. While this would allow a slight increase of height in new streets over 53 ft. in width, it would definitely restrict the height in narrow old streets in which, as the Committee point out, such restrictions are specially and urgently necessary. The City of London, as was perhaps to be expected, is to retain all its present privileges and exemption from the restriction of height in narrow streets. The question may reasonably be asked, "Is it one of the City's 'privileges' to be allowed to shut out more of the sunshine than elsewhere in London?" It is suggested that the power of the L.C.C. to grant increased heights in special situations should remain, but that the L.C.C. should in such cases confer with the Fine Art Commission.

Useful suggestions are put forward as to open spaces about buildings, which will tend to simplify the task of the architect and do away with some of the anomalies of the present law, especially with the special provisions as to open space in connection with working-class dwellings.

At present, under Section 45, a bedroom window may open into a long narrow court, and it is suggested that this should be reviewed on the lines that the window should be in such a position that at least the centre of the room should be adequately lit.

This adequate lighting of rooms in internal courts is still unsatisfactory, but, as all architects know, it is not always easy to bring existing conditions into conformity with one's ideals of what should be done. A suggestion from the district surveyor in this respect will frequently be of the utmost value in dealing with a difficult situation.

Most architects will agree that the return frontage of 40 ft. down a side street is hardly sufficient for modern requirements; 50 ft. is suggested.

On the subject of materials and construction the Committee contend that many of the provisions of the present constructional clauses are obsolete, and if obsolete, it seems useless to keep them on the Statute Book, particularly if unnecessary delay and expense are incurred in obtaining unnecessary consents. Power should undoubtedly be given the L.C.C. to amend the rules as to construction and materials from time to time as necessary, without going to Parliament every time a slight modification is desired. A valuable suggestion by the Committee is that the L.C.C. should be empowered to set up an Advisory Board on which architects, engineers, builders and property owners should be represented, to frame, from time to time, rules for construction and building materials which, when sanctioned by the L.C.C., should become binding. Whether such a drastic revision of present practice is possible or not, there can be no doubt that the existence of a permanent technical advisory body would be of the utmost value in the administration of the Acts.

A large number of other suggestions are made by the Committee, which will be dealt with in detail in a subsequent issue of *The Builder*.

Northern Architectural Club.

Members of the Northern Architectural Association Club held an excursion recently to Lumley Castle. There were twenty-five present, including Mr. W. T. Jones (President), and Mr. J. F. H. Checkley (Hon. Secretary). Features of the historic landmark were explained by Mr. Dick, who read a paper on the Castle.

Lych Gate, Beckenham.

The Lych Gate at the Parish Church, Beckenham, is said to be the oldest in England. It has been much admired by antiquarians, and copies exist in many parts of England. At the present time, however, some of the old tiles have fallen, and it is in need of urgent repair.

THE NEW AND THE OLD

A LECTURE BY WIRELESS

It is a common complaint that the architect lags far behind in the rapid advance in which others appear to share, and as a ready scapegoat he is often blamed for any instance in which building enterprise has appeared unready for events, though in reality he may have been impatient to get ahead and ready with a plan before others would even consider it. However, at times the architect does ask himself, perhaps a little morbidly, "Have we advanced at all since the time of Wren? Are we ever to follow and never to lead?" And the thought of the new things that science is able almost daily to reveal lends an added bitterness to the question.

Yet we need have no fear, for the helter-skelter of science will never suit the surer and more ordered progress of art, which finds its true expression when the whirlwind subsides. We may, in fact, leave our friends of the fiddle and paint brush to dance wildly with the times in discord and cubist horror. The discord will fade into thin air and the daub can be burnt when we have again found ourselves, but our work is to remain for our children's children.

What a bewildering world of possibilities is opened up by the development of broadcasting! This laying-on of information at the main, what will it bring forth? Shall we value the results so highly after we have turned on the simple tap as when we had to work hard, dig deep into books and libraries of books, and make long journeys in the quest? Shall we in time rather grow weary of anything calling for effort and turn with relief to a lighter entertainment?

Readers of *The Builder* will perhaps forgive this little moral preamble before referring to a lecture upon "National Churches, and how they are taken care of," broadcasted by Mr. F. C. Eeles, Hon. Sec. of the Central Committee for the Protection of Churches (Victoria and Albert Museum), on a recent evening. The conservative theme must excuse the radical means if any apology is needed.

Concerned, as we are, with steady and healthy progress, there is nothing that should hearten us so much as the confidence born of the knowledge of secure achievement in the past, and the care of all evidence bearing upon the latter is therefore of paramount importance. It is good to hear that we have such live organisations to watch over the precious heritage which our fathers have left to our care.

Mr. Eeles reminded us that it was in England that the parish church attained its highest development, however much we might have to bow the knee to our Continental neighbours as to the scale and grandeur of cathedral design. We are also comparatively fortunate in that the vandalism of Cromwell destroyed far less than our neighbours had to suffer at the hands of misguided religious scruple during the Reformation period and after. Strange to say, in some directions the constructive zeal of the Gothic revival did more damage than the destructive exercises of Cromwell, so Mr. Eeles informed us. The revivalist, in a false self-confidence that he had thoroughly absorbed the Gothic feeling, presumed to pick and choose between the merits of this and that example, and in the particular case of mediæval stained glass ruthlessly destroyed many a priceless example to replace it with what he considered more in the correct spirit. Consequently, although the development of stained glass attained its zenith in the fifteenth century, both as to quality and quantity, the collection of retained works of art of this description is sadly depleted. This is of interest when considered with Mr. Goodhart-Rendel's recent paper on Gothic, in which he claimed that there has never been a break in the development of Gothic architecture, of which the revival was a living part.

In quite recent years only has the public conscience awakened to the value of our ancient architectural treasures, and the existence of the latter become somewhat less perilous. We are, indeed, fortunate that, in the accidents of events, we have retained so much that is priceless. The Ancient Monuments Act was perhaps the first definite indication of this awakening conscience, and one of the results of the Act has been the strengthening of the full machinery of the body which Mr. Eeles represents. Prior to this, the granting of a faculty to permit alterations and additions to a church was contingent upon legal considerations only. Now we have the artistic factor admitted.

In each diocese there is set up its own committee for the protection of churches to act in an advisory capacity in all cases where it is proposed to tamper with an ancient church, and these committees are co-ordinated under a central body to which local delegates are sent, and which is in direct touch with the Victoria and Albert Museum, and with all the material and records therein contained. Those who project such schemes requiring a faculty are advised first to consult their local committee before making application for it; but even this precaution is neglected and the fac at once applied for, the diocesan auth will themselves seek the views of their mittee, and these will bear directly up success or otherwise of the application. machinery has become, therefore, a very ful influence towards the suppression o dalism. Mr. Eeles pointed out that it w policy of these committees to urge the e ment of a capable architect, and with the of such a man they do not interfere un offends against the purpose for which they been called into being. They are, ho always available to give valuable advice called upon, and many architects are gl avail themselves of such facilities when do not feel too confident in themselves. need not, therefore, anticipate the ev ordinary bureaucratic control in the exe work of these bodies.

The importance of this work has come much to the fore since the war, owing t great number of memorial schemes proj Mr. Eeles confessed to some outstanding fai notably one in very recent years, when a pri fourteenth century screen was taken dow burnt to make way for a modern war mem Against such instances he could point to spl achievements. A list of all works of value i churches of England is now nearing compl Much has been done to encourage plain lett and unbroken white wall surfaces, and man bells have been saved from the melting po re-casting. Quite recently, a beautiful old screen found in a loft has been restored t original position in a Somerset church.

Mr. Eeles spoke for a bare ten minutes, it was sufficient to kindle a lively interest i subject he had obviously much at heart, a awaken a comfortable confidence in the care with which our national treasures are h protected.

All Hallows Church.

In the course of a recent letter to the E the Rev. Montague Fowler, who is appe for a further £300 to complete the wor reparation of this City church, states: ' Hallows Church, from an architectural poi view, is unique as representing the trans stage between the long Italian renaissance the short Greek revival. From an histo point of view it has no rival, inasmuch a occupies a site on the old Roman Wall, on w a church has stood since the fourth centu

THE LIGHTING OF PICTURE GALLERIES AND MUSEUMS

THE LESSONS TO BE LEARNED FROM THE WEMBLEY EXHIBITION

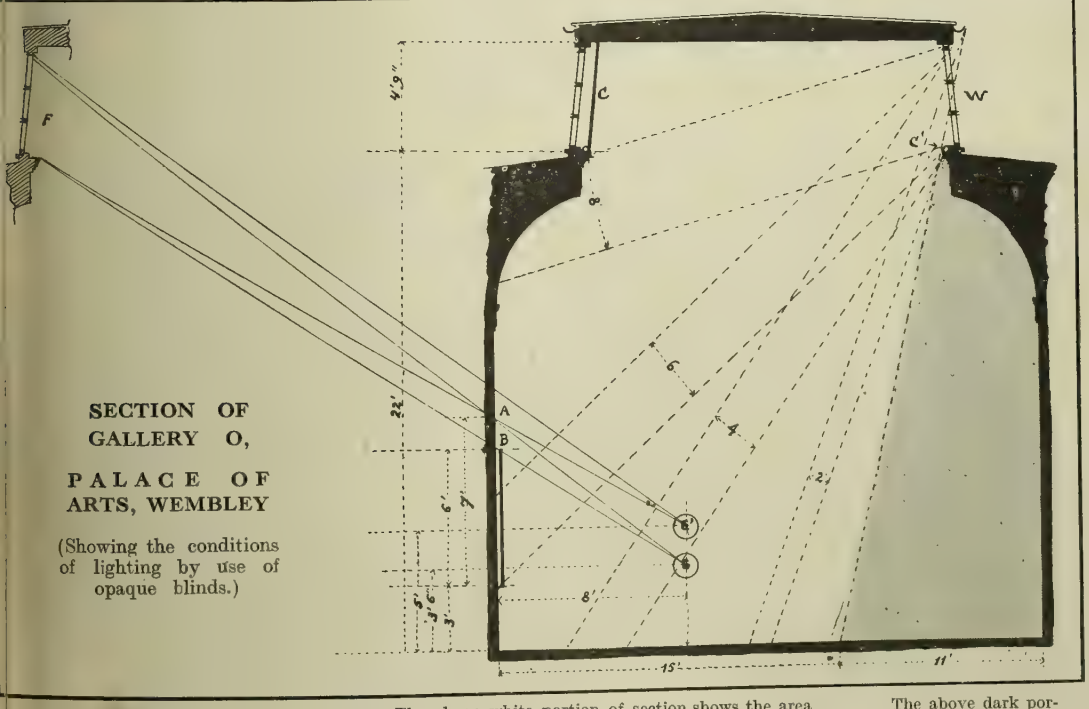
By S. HURST SEAGER, F.R.I.B.A.

1911, on the opening of the new Room 25 at the National Gallery, the journalists loud in their praise of "the beautifully ed room," while at the same time a rous correspondence was being carried on hose whose attention was centred on the res. Picture-lovers were angry that "it impossible to see the pictures for reflec-." An editor in a professional journal d that while he did not agree with his spondents that it was quite impossible to he pictures, "the reflections certainly did fere very largely with the enjoyment of ." History now repeats itself. Journal- are again praising "the beautifully ed." "the splendidly lit" galleries in Palace of Arts at Wembley, and it is with great diffidence that I feel compelled to e a discordant note in their harmonious ns. I should not do so if it were not for fact that, having given up many years to study of gallery lighting, I know the result ry far indeed from the ideal which should and can be, reached in our picture gal- s. Everyone will agree, and I do most tily, with the unstinted praise given to general appearance of the rooms, the col- on, and its arrangement. The enthusiasm hese things is apt to carry the critics past defects in the lighting of the pictures selves. Their praise, and that in the vord of the catalogue, gives warrant to e who may be designing galleries in the re to follow the example here set, just as authorities at Wembley have followed pre- nts which, while giving a general impres- of good lighting, absolutely fail in the ntials for lighting pictures. The funda- tal principles are:—

) That the source of light should not be visible to the spectator; and

) That the walls should be better lighted than the floor, that is to say, the spectators and objects upon it.

I was informed that the architects wished to light the rooms by different methods, and among them the Top-Side-Light method I have advocated, which conforms strictly to the principles laid down. This method has stood the test of scientific examination, and is carried out at Wanganui, New Zealand. This gallery Lord Leverhulme had the opportunity of seeing on his late visit, and of it he writes: "I was especially pleased with the lighting of that gallery. I thought it most excellent and exceptionally free from reflections in the pictures."



That the wish of the architects at Wembley was not carried out is much to be regretted, and a splendid opportunity of comparison and selection has been lost. It was natural to suppose that a visit to Wembley would show a thoroughly scientific and artistic method of lighting—that the plea of *The Builder* in 1853 for a building "not only good enough but the best possible," "scientifically correct and structurally perfect," would at last be granted. There is an infinite variety of methods and degrees of lighting in this vast exhibition, but in no case throughout the whole of the exhibition can there be found any method of *daylight* lighting which can be regarded as perfectly satisfactory. Very many of the exhibitors, realising the difficulty of getting satisfactory daylight lighting, and having at hand highly skilled electrical engineers ready at once to light their exhibits by electric light, very naturally adopted this system. The results are a triumph for this method. If daylight were a commercial commodity there doubtless would have been engineers to study also the question of providing it, and highly artistic results would ere this have been achieved.

The Palace of Arts and the greater number of the pavilions are very much overlighted; it was only in the Canadian building, and in many of the small pavilions, that we could learn what a beautiful effect could be obtained by shutting off the greater amount of light, thus getting rid of the glare and giving to the galleries a feeling of artistic restfulness. This is especially notable, too, in the beautiful series of rooms in the Palace of Industry.

It is necessary for general exhibition purposes that there should be a flood of light, of which the exhibitors can make what use they please, but the light should be well diffused by a glass which shuts out the sun's rays.

The amount of light is, as will be remembered, accurately determined by reference to a standard of candle power, and the unit of measurement is the amount of light which is thrown by a standard candle at a distance of one foot, and this is spoken of as a candle-foot or foot candle, and briefly here referred to as "C.F." In the avenues of the Palaces of Engineering and Industry when the sun was obscured, the lighting was over 100 C.F., and in the Australian and New Zealand buildings the same results were seen. This is much more than enough. The light in the motor section is reduced by covering half the roof area with coloured draperies, thus reducing the light by at least one-third, with very pleasing results. A great improvement would be effected if vertical draperies were hung, as in the side avenues of the Australian building. This prevents the skylights being seen by the spectators, and shuts off many of the sun's rays. A great many of the exhibitors have very rightly shut off this intense light by building either solid ceilings or reducing the lights by various fabrics. This can be found throughout the Indian Courts, where the light was reduced to 40 C.F. in the corridors under the skylights and 15 C.F. in the bays. In many of the bays the reduction was to 6 C.F., which gave an exceedingly pleasing light and one sufficiently bright for the exhibits.

The Gold Coast Building is one of the

SECTION OF GALLERY O, PALACE OF ARTS, WEMBLEY

(Showing the conditions of lighting by use of opaque blinds.)

The above white portion of section shows the area lighted by direct light, and the dotted lines within it show the relative amount of light upon the walls and floor. (It is clear that if both windows were exposed the direct rays would be increased on spectators and floor, but no direct light would be added to the pictures.)

The above dark portion of section shows the area lighted by reflected light only.

NOTES.

F.—Representation of the window (W), the same distance from the wall as the window itself (the visual image).

E.—The eye of spectator when sitting at a distance of 8 ft. from picture.

E¹.—Ditto, when standing.

E & E¹-F.—Imaginary rays from the eye to the visual image, marking the positions of the reflection of the window on the picture plane—(B) when sitting, (A) when standing, ∴ showing that the reflections of the window are above a 6 ft. picture when sitting and a 7 ft. picture when standing.

C.—Opaque blind closed, shutting off bright light from the spectator and from the pictures on the opposite wall.

C¹.—Opaque blind rolled up. (When closed and C rolled up, the lighting effects are reversed.)

Therefore, in conjunction with Art Gallery glass, these blinds give complete control of lighting conditions at any time of day, independent of sun or its position.

greatest interest. The light here is reduced by nearly solid ceilings. In the Central Court the light on the floor was 18 C.F., and on the walls of the piers 6 C.F., and the restful effect was enhanced considerably by the dark tone of the walls and ceilings throughout. This Central Court, which is 10-sided, has bays electrically lighted opening from eight of its sides. The Court adjoining this Central Court is rectangular and is an extremely interesting arrangement of bays at the side of the central corridor. In the centre corridor the light has been reduced to 6 C.F. on the floor, giving 5 C.F. on the walls and the piers of the corridor. The bays are electrically lighted by hidden lights placed where in my top-side-lighted method inclined skylights would be used, and they throw on the walls of the bays a light of 6 C.F.

In the Canadian Pavilion (as also in the small rooms in the Palace of Industry) the light in the main courts is reduced to 12 C.F. when the sun is shining. The cases are all electrically lighted and have about 18 C.F., so that a brilliant effect of lighting is thus produced. In the Court in which the working models are shown the reduction is down to 1½ C.F. This, on entry, is found to be somewhat gloomy, but after a few minutes the light is found to be quite sufficient, even to see the exhibits in the glass cases which are placed within it. The effect is very pleasing because of the well-lighted bays at the sides. These are lighted up by electric light of probably five or six candle-power, and the impression created by this arrangement is I believe, acknowledged by all to be most satisfactory.

But it is not necessary, nor do I advocate reducing the light in art galleries to this extent. The best result would be given if the light were about 3 or 4 C.F. on the place where the spectator stands to about double or treble this on the pictures. It cannot be emphasised too strongly that in no case must light from the source of light fall upon the spectator. If it does, the pupil of the eye is so contracted that the rest of the building seems ill-lighted, although it has three or four times, or even more, light than is necessary. Conversely, if the spectator is in the dark, a lighted object appears much more brilliantly illuminated than it really is. This can be easily proved by the measurements which I took in the Panorama of War in Paris. There the light where the spectator was standing was only about 1.0 C.F., and the daylight on the picture was only about 5 C.F., yet the effect on a spectator was that the picture was most brilliantly lighted. So, too, in artificial lighting, as in cinema pictures. In the New Zealand Cinema Hall—the light in the room is subdued to .05, just sufficient to see the seats and the spectators—the light on the screen is only 5 C.F., and yet, as everybody knows, the pictures appear to be most brilliantly illuminated. The difference in illumination of the spectators and the screen is as 1 to 500. These two examples, as also the Canadian Court, have, of course, but little relation to picture-gallery lighting; they are only stated in order that it may be fully realised that the apparent intensity of illumination is the result of relativity, not the C.F. power.

And the same effect, in a minor degree, was produced on the Parisian critics in reference to the side-lighted room at the Louvre, which had been carried out in accordance with suggestions I had made. There, because in viewing the pictures the light was at the back of the spectator, the pictures appeared to be illuminated to a high C.F. power, and led one journal to state "the light was so fierce that it would ruin any picture placed in it," yet that apparently "fierce light" was only about one-tenth of the light which falls upon the pictures in the majority of single-glazed top-lighted galleries in every part of the world.

It is necessary that we should have in our minds typical buildings to which we can refer—for comparison—any system of lighting. I have lately been measuring the actual amount of light in various buildings in Italy, France and England, as well as the whole of the pavilions at the Wembley Exhibition, and the conclusion to which one arrives is that the very great majority of our art galleries in all parts of the world are over-lighted to such an extent that a danger arises of rapid deterioration of the pictures. I stated this at my demonstration at the Royal Institute of British Architects, and referred to Room 25 at the National Gallery, which I stated was much over-lighted and suitable for conversion into the top-side-lighted method. A critic, in the discussion which followed, stated that it was not by any means over-lighted and it was a very pleasant gallery which he enjoyed visiting. I had not then an accurate determination. It was simply a question of individual feeling. Room 25 is lighted by a large single-glazed skylight covered by calico, preventing the sun's rays from entering the room. On a bright, sunny day there are no less than 100 C.F. on the floor. Observations were made in the morning so that the west wall was much the brightest—here there were 50 C.F.; on the east wall 25 C.F.; the south wall also 25; and the north wall 35. When the sun was obscured by clouds the light on the floor was nearly half, viz., 50 C.F., and all other measurements in proportion.

The same results are seen in the two sky-lighted rooms at the Palace of Arts, Wembley. The lighting of most of the rooms is by means of lantern light, viz., nearly vertical windows close to the ceiling over the centre part of the room. The ceilings are solid and the light from the lantern windows is thrown directly on to the upper part of the walls of the room, and in a lesser degree on the lower part of the walls and floor.

Let us turn to a building which is universally admitted to be one of the best and most evenly lighted buildings in the world, viz., the Pantheon at Rome. The building is 100 ft. in diameter, and the whole of the lighting is obtained by an opening 26 ft. in diameter high up in the top of the dome. The amount of light on the floor was under 3 C.F. compared with 100 C.F. at the National Gallery and all galleries in the world of that type. Owing to the height of the source of light it is not visible, and the diffusion was so even there was very little difference found between the part of the floor immediately under the light and that close to the walls. The light on the walls was only ·75 C.F., and yet the pictures, which were fairly dark, could be very easily seen in all the details. The same effects were seen in various galleries in Italy, where in very many cases the light was about 1 or 1½ C.F., and the pictures could be seen without any difficulty.

We have now standards from which to judge whether an art gallery or museum is, or is not, over-lighted. The whole question is (as stated above) one of relativity between the amount of light where the spectator stands and the amount of light reaching him from the picture or exhibit. If the spectator is in a relatively subdued light, the effect will be restful and pleasing, and the pictures can be seen quite free from annoying reflections. This can be proved any bright day in the courts running north and south in the Palace of Arts. The observations I made were taken in Gallery O at 1.30, when the sun was shining through the clear glass on the western side, and its rays falling as a longitudinal strip about 2 ft. wide in the centre of the floor. The east windows were shielded by translucent blinds. Therefore the west side was in shade and the east side in bright light. On the floor, in the shade on the western side, the meter recorded 20 C.F., on the eastern side 50 C.F. The western wall had an intensity of 15 C.F., and the eastern wall the same as the eastern part of the floor, *i.e.*, 50 C.F. Here the difference is as 1 to 3.3. Under these conditions the lighting of the pictures on the bright east wall was nearly perfect; the bright light obliterated the reflections entirely in the lighter pictures, and in the dark ones they did not in any way interfere with the spectators' enjoyment. Under these circumstances it was astonishing to see how the spectators turned unconsciously to the well-lighted pictures, enjoyed them to the full and passed out without realising that they had ignored the equally valuable pictures hanging on the opposite ill-lighted wall. Proving at once that intense enjoyment and enthusiasm can be readily created if the pictures on the walls of our Galleries could only be properly seen. Exactly the same effect was seen on a sunless day, when, of course, the C.F. was very much reduced. (I have yet to determine the exact amount of difference of C.F. on the opposite walls for varying types of pictures to ensure that the reflections will not be seen in those on the bright side.)

Fifty C.F. on the bright side is at least five times more than there should be, for 10 C.F. is quite enough even for the darkest picture to be properly seen if the lighting is scientifically arranged. The pictures on the shaded west wall were full of overpowering reflections, even though there were 15 C.F. upon them. If the relativity were not altered the reflections would remain the same, and the lighting on the west wall, divided by 5, be reduced to 3 C.F. This is a most valuable demonstration. It shows the possibility, with lantern lights, of shutting off with opaque blinds each side in turn, and of having a perfect lighting quite free from reflections on the relatively bright side.

The sun's rays should undoubtedly not be allowed to enter the galleries, and this can be avoided by putting over the present sashes large sheets of what has been known as Pilkington's "Kaleidoscopic" Glass, but which in future will be known as Art Gallery glass. This, without diminishing the light to any appreciable extent, will so scatter the rays as to render them harmless.

When the light is scattered in this way the perfectly diffused light in the Gallery may be reduced as required by practically closing the the opaque blinds; *and the amount of illumination will be in proportion to the* aperture formed. For instance, taking the full size of the Lantern light at 1, which gave (as stated above) 50 C.F. on the pictures, then, if the blind is half drawn the illumination will be reduced to ½, or 25 C.F. So on to any C.F. power, in accordance with the amount of light required for the picture exhibited.

This needs actual proof and demonstration—a proof which could be most easily given in one half of Room O if the above glass and blinds were fixed.

Blinds are usually made use of only to shut out the rays of the sun, and, if translucent (as they always are), serve to equalise the light in the room. The result is, the spectators being highly illuminated, the reflections of both spectators and opposite pictures are of equal strength in the pictures on both sides. This can be proved on any bright morning in Room O if the translucent eastern blinds remain drawn as at the time of my morning visit.

The beautiful collection of pictures in the large square rooms V and U suffer to the same extent on the east and west wall, and to a far greater extent on the north and south walls, where the light from the lanterns (which run north and south) is thrown direct on to the spectators, converting the pictures into looking-glasses in which are seen not only the spectators and the opposite pictures, but also most powerfully the white architraves and cornices, which should, unquestionably, be tinted the same tone as the walls. The east and west windows over the east and west walls should be entirely blocked up, for their light is not thrown on a picture wall but wholly on the floor, where, when the sun was shining, the light in a shaded part of the floor was 50 C.F.; when it was obscured at 3 o'clock it was 35 C.F., the light on the east wall 18 C.F., and the south wall 10.

These rooms are admirably adapted for conversion into Top-Side-Light ones with a central corridor. In addition to the blocking up of the east and west windows, all that would be necessary would be to form a tinted fabric

ng over the central part, giving a subdued t over the spectators, and thus, in contrast, righter effect on the pictures of the east west walls. Here the glazed pictures ld be beautifully seen, while the north and h walls, where the reflections are now t overpowering, could be fully utilised for many pictures which are unglazed.

hen the light on the floor of Gallery U 35 C.F., the light of the Sculpture Hall was only 7 C.F. on the floor, 3 C.F. on north wall, and 2 C.F. on the south wall. s subdued lighting results from thickly ting the large lantern windows. The con- in the lighting of the Sculpture Hall and Galleries is a valuable illustration, show- how the eye immediately accommodates f to the altered conditions. The light on floor was only one-fifth of that in the rn-lighted and only one-tenth of that the sky-lighted galleries, yet it was dull, for the vertical lights are above the spectator's eye, high gh to fulfil the first principle of lighting, that the source of light should not be le when looking at the exhibits. The pture Hall might well be lighter, for it is ccepted rule, often expressed by sculptors, the nearer the lighting of a sculpture hall oaches the conditions of the open-air the r. This is proved by the great flood of —softened by a white muslin velarium— at the Grand Palais at Paris, where the pture is most beautifully lighted. More- , there should be in all art galleries great ty in the form of the rooms, the lighting t, and the colourings. It is for the sculp- and the decorative arts other than e exhibits that we should have our lendidly lighted" rooms—these can be excessively lighted and the desirable ast obtained without any harm being . These arrangements are reversed Wembley, so that we have sculpture in a ued lighted gallery, highly suitable for res, and pictures in the brilliantly lighted s highly suitable for sculpture, if the light roperly diffused.

he possibility of lighting pictures so that can be admirably seen quite free from ctions is demonstrated beyond dispute, and without interfering in any way with the nities of the gallery. Its appearance d, in fact, be considerably improved. s to be sincerely hoped, in view of the uble collections of works of art at mbley and in all our galleries, that they be converted as far as possible into gal- s approximating to the top-side-lighted system, and that in all our new galleries the greatest possible care will be taken that the defects seen in the past shall not be repeated.

NOTE.—The comparison between the different buildings is only approximate. In the unsteady light of this climate, and especially under the fleeting clouds and sunshine we have lately experienced, the light is constantly and instantly changing 100 per cent. and more. Accurate comparison between different buildings can only be made by a "light factor" obtained by simultaneous exterior and interior readings. This is not necessary, for, as stated, the success of any art-gallery scheme of lighting depends, fortunately, not on the *amount* of light, but only on the *relative* light on the floors and walls. This can be accurately determined at any time when the sun is shining, as also in the constant light of a bright though sunless day.

Since the above article was written, a thick canvas screen at ceiling level has been placed under the lights over the two small Water-Colour Rooms at the ends of the Gallery running east and west, and this has reduced the light, when the sun is shining, to 10 C.F. on the south wall. The pictures on this wall were beautifully lighted; the light on the north wall at the same time was 7 C.F., and gave unpleasant reflections. The sun was prevented from falling on the screen by translucent blinds on the south windows. This is an excellent illustration, proving, as has already been stated, that 10 C.F. is ample to give a pleasing effect. When the sun was obscured, the lighting on the south wall was 5 and on the north wall 3, and reflections were seen in pictures on both sides, owing to the evenness of the lighting throughout.

BOOK REVIEW

Structural Engineering. By J. HUSBAND and W. HARBY. Third edition. Revised and enlarged. (London: Longmans, Green & Co.) 16s. net.

The fact that a book has reached a third edition is evidence that it has successfully filled a want. Many of the problems considered have been simply and clearly dealt with. In the preface a claim is made that the use of the so-called advanced mathematics has been avoided, and that such knowledge is not generally necessary in the actual work of design. When such a claim is made, it is frequently found that the methods adopted in computation are more involved and less direct than they might be. In some respects this is the case in the authors' work when dealing with moving loads. The use of influence lines simplifies and generalises the work of computation of the maximum stresses produced by moving loads, and the section dealing with these matters should have, we think, been re-written and free use made of this labour-saving device. As it is, the subject of influence lines has been dealt with in twenty-one pages, and the construction due to Professor Howe is not even mentioned, although it is a purely geometrical device involving no calculation and is applicable to the cases dealt with by the authors. We hope they will make fuller use of this method throughout their work when the next edition is called for.

The word "stress" is used rather loosely; on page 40 the term is defined as the load carried by unit area: i.e., in reality a stress is the ratio load divided area. According to this, a member of 3 sq. in. cross-sectional area will carry half the load of another whose cross-sectional area is 6 sq. in., if the *stress* is the same in each. Yet very generally throughout the book the forces due to the loading of a structure are called stresses. For example, a bowstring girder is shown in Fig. 194 on p. 252, and figures are given showing the stresses (?) in each member, and the so-called stresses in two members are figured as 155.4 tons—a truly heavy stress for any ordinary quality of steel used for structural work. It is obvious, of course, that the 155.4 tons is not a stress, but the total load carried by the member. Why should the authors define the word "stress" to mean one thing and use it more frequently to indicate something else?

In Chapter IX, when dealing with the deflection of structures, one or two useful examples are worked completely, but no mention is made of the Williott graphical method, which has the advantage that it gives the relative movements of each nodal point, as the result of one diagram.

There is so much that is useful in this work that it appears worth while to refer to the one or two points mentioned, as the authors may have an opportunity to consider the advisability of revising when the next edition is demanded.

Design for a City Church to Seat 500. By MR. WILLIAM DAVIDSON, A.R.I.B.A.

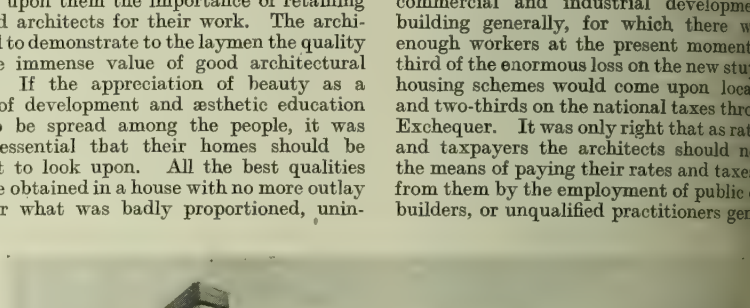
THE INCORPORATION OF ARCHITECTS IN SCOTLAND.

Annual Convention.

THE Incorporation of Architects in Scotland held their eighth annual convention in Ayr recently. Mr. T. B. Marwick, F.R.I.B.A., Edinburgh, the president, presided.

In the course of his reply to the civic reception by Provost M'Donald, Mr. Marwick said the Glasgow Chapter had acted wisely in selecting the county of Ayr for their annual gathering. It was one of the most picturesque and beautiful in Scotland, one hallowed by many interesting associations, immortalised by their national poet, and with a long and distinguished roll of honour which included such names as James Boswell and John Galt, the novelist. In the town of Ayr, which occupied the focus of the screen of panoramic heights which encircled it as in a vast amphitheatre, they as architects took a special interest. This not only for its beauty, its magnificent town steeple by Thomas Hamilton, its dignified county buildings, but also for its cleanliness, orderliness, and its lovely vistas of sea and mountain. There was endless delight in its landscapes and wonderful sunsets. They had shown much wisdom in the preservation of objects of historic interest, and he was sure they would exercise similar wisdom to conserve all its natural charms. It was the birthplace also of one whose name they had been acquainted with from their first years of studentship. James Fergusson wrote a "History of Architecture" which all architects looked upon as a standard and monumental work.

The report by the president of the Council showed that there had been admitted to the various classes of membership during the past session 4 Fellows, 7 Associates, and 45 students—the total membership being at this date about 630.



The following item was also contained in the report:—"The R.I.B.A. instituted last year a medal for the best street frontage in London, and expressed the desire that this should be taken up by other large towns. On representation being made to them that such a medal might be awarded with advantage every five years in the large towns throughout Scotland, they readily agreed to the proposal, and offered to present the medal quinquennially, leaving conditions and arrangements in the hands of the Incorporation. The details are now being considered."

Mr. Marwick expressed the hope that the inauguration of such a medal would stimulate architects as well as building owners to vie in the production of good work. The following three Incorporation representatives were appointed to the Council for the ensuing year:—Messrs. John Begg, F.R.I.B.A., Edinburgh; James A. Morris, F.R.I.B.A., Ayr; and P. G. K. Young, F.R.I.B.A., Perth.

Mr. T. P. Marwick, in the course of his address as retiring President, made strong protest against the employment by public bodies of unqualified architects. Reviewing the work done by the Council during his tenure of office, and pointing out that the membership was now 629, and the invested funds £20,000, Mr. Marwick referred to the question of registration. He stated that the amalgamation of the Royal Institute of British Architects with the Society of Architects would go forward, and within the next year or two registration might be a practical realisation. In no other way would they be able to keep out the untrained and incompetent, or inspire respect for a great traditional calling. It was necessary that there should be some statutory protection for the man responsible for the artistic conception of a building, and for its practical utility and substantiality. He protested against the employment by public bodies—often composed of men who should know better—of those who, while able to produce plans of a kind, had no proper comprehensive knowledge of architectural design and practice.

Housing might develop into an important sphere of work, but it was not within their province as architects to deal with the political aspect of impracticable, grandiose schemes for which the labour was non-existent; the question of a return to fundamental economic laws; the difficulties of private enterprise; or restrictive laws which hindered building. It was the duty of the Incorporation to bring pressure to bear in every way upon municipalities who were apparently to be the employers of the future, so as to impress upon them the importance of retaining qualified architects for their work. The architect had to demonstrate to the laymen the quality and the immense value of good architectural service. If the appreciation of beauty as a means of development and æsthetic education were to be spread among the people, it was surely essential that their homes should be pleasant to look upon. All the best qualities could be obtained in a house with no more outlay than for what was badly proportioned, uninteresting, and objectionable; and the architect had to show that only by the employment of good architects could orderly arrangement, constructional power—in fact, real efficiency with effectively controlled expenditure—be obtained.

Building costs would almost certainly advance as the demand increased and the number of working hours were diminished. It was hopeless to expect otherwise. This was bound to have its repercussion on the nation by restricting commercial and industrial development and building generally, for which there were not enough workers at the present moment. One-third of the enormous loss on the new stupendous housing schemes would come upon local rates and two-thirds on the national taxes through the Exchequer. It was only right that as ratepayers and taxpayers the architects should not have the means of paying their rates and taxes filched from them by the employment of public officials, builders, or unqualified practitioners generally.

PROPOSED·HOUSE·AT·KENMORE·PERTHSHIRE
FOR·LIEUT:COL:A·F·EGERTON·D·S·O.

MR. WILLIAM DAVIDSON, A.R.I.B.A., Architect.

was through the architect's work that any
ovement in the housing of the working
es was due, and public authorities would be
y advised who endeavoured to carry out
mes without architectural skill.
ith regard to the new Land Values Bill, Mr.
vick said that if it was to be on the same
as the 1909 Act, then trouble was ahead.
last Act legalised differential taxation on a
icular class of the community. The cost of
ction exceeded the revenue. It depreciated
apital value of land and property, so that
ons were lost in the Death Duties which
me exigible on this depreciated value instead
the former high values. It destroyed con-
ce; it blighted the production of houses;
opped development, and it checked invest-
t in reality. Values were a constantly-
ging medium, and the so-called Doomsday
was useless before it was well begun.
the matter of education, he advocated that
pulous attention should be paid to it. All
nits should have the best preliminary general
ation possible. With a good education,
wed by an artistic education of the highest
ity, they would go far and lay the ground-
for unqualified success. These qualities
t, of course, be followed up and reinforced
the essential qualities which attended all
ess—enthusiasm, perseverance, and a pas-
ate love for their work even to its smallest
il. They wanted to see their profession
le attractive to men of special qualifications,
of high principle, and men of natural ability.
he President then nominated as his successor
John Keppie, F.R.I.B.A., Glasgow, who was
installed.
berdeen was unanimously chosen for next
r's convention.

TOWN PLANNING*

THE two papers by Mr. D. Llenfer Thomas
Professor Abercrombie, reprinted in pam-
et form from the "Transactions of the
nourable Society of Cymmrodorian, 1922-23,"
of considerable value as contributions to
solution of an urgent problem—the con-
vation of the natural beauty of the Princi-
ity and as a guide indicating the direction
ch should be followed in urban development.
Thomas rightly urges that the present time
ipe for the preparation of a development plan
the whole of Wales, and made up of a series
Regional plans so designed as to enable the
abitants to "extract every ounce of profit
l pleasure—of wealth in its broadest Ruskin-
sense"—from this fair land. This should in-
de the survey not only of the development
urban areas and industrial districts, but
o such matters as a soil survey, vegetation
l botanical surveys, a zoological survey of
rasites and animal diseases, surveys of
matic conditions, and water resources.
Professor Abercrombie makes a good case for
e regional survey as a means of preserving the
tural beauties of the country without in any
y hindering the development of its industrial
ources. He observes that the Welsh do not
pear to own either the French genius for the
wn or the English instinct for the village,
d notes the striking and well-known contrast
tween "the natural loveliness of Welsh
untry and the artificial ugliness of her human
ndiwork." He considers that there should be
national School of Town Planning and Archi-
cture, where those who are to be technically
sponsible for the custody of the land of Wales
ould be trained to know her requirements
d possibilities, and says, "The Welsh
ving had their own urban arts destroyed by
me or lost by desuetude, must not attempt
borrow a ready-made substitute from England,
ance or America. It is the recovery of a
rgotten art that is required, not the importa-
on of a new."

untry." By D. Llenfer Thomas, M.A., and Professor
trick Abercrombie, M.A. (Cardiff: Welsh Housing
d Development Association.) Price 1s. net.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

**** *We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.*

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript?—ED.

Deadening Sound.

[REPLY TO E. G. S.]

SIR,—The conduction of sound through brick walls has something of a mystery about it, in that particular instances present such curiously contradictory effects. Cases have been known where through 18 in. of brickwork it has been possible to hear voices quite plainly in an adjoining house, while in other cases 9 in. of brickwork proves a fairly perfect sound insulator.

Variation in the structure of different types of brick and in the homogeneity of the mortar joints probably accounts for the wide difference in different instances.

It is probable that if such a wall as that referred to by E. G. S. were battened and lath and plastered, most of the sound would be absorbed by the cushion thus produced. The cost would be in the neighbourhood of 4s. to 4s. 6d. per yd. super, and it is for your correspondent to judge for himself if the annoyance is worth this outlay. A more perfect cure would be to pack the space between the battens with slag wool or other sound absorbing material, but this will run up the cost, and I think the simpler way will confine the nuisance within tolerable limits. A.M.

[We have received several other suggestions for combating this nuisance, which we have forwarded to our correspondent, "E.G.S."]

Cubicle Doors.

SIR,—In the construction of cubicles for public hot baths, can you or any of your readers tell me the best material and design to prevent warping of cubicle doors exposed to heat and steam? "LINCOLN'S INN."

Cracks in Concrete.

SIR,—If not troubling you too much, I should be greatly obliged if you would kindly tell me why, in respect of steps, &c., built in concrete, cracks develop, *e.g.* (1) steps, where the inner core is rough concrete, with a cement outside skin, 1 to 2 in. thick; and (2) window sills, inside core hard brick, with a cement outer skin as just mentioned. My inside cores are all right, but the outer casings sometimes crack. These casings are composed in one case, Portland cement and sand, equal parts; in another, one part cement and three sand; 75 per cent. of my work comes out perfect, but the rest shows developing cracks. If you would help me with your advice, I should greatly esteem it.

A. R. B.

Vertical Glazed Tiling.

SIR,—In connection with the fixing of vertical glazed tiling to cheeks and surrounds of fireplaces subjected to heat, it is found that Portland or Parian cement is not satisfactory, as tiles frequently become loose.

We should like to hear of a suitable preparation for this purpose, if any of your readers can kindly inform us.

E. W. TURNER.

Stoves.

SIR,—I should be glad if any of your readers could recommend a stove that would heat hot water and four or five radiators. A gas cooker will be used for the cooking.

"LIVERPOOL."

Fire Resisting Floors.

[REPLY TO STUDENT.]

SIR,—My personal feeling has been always in favour of work cast *in situ*, setting to a perfectly homogeneous whole in its natural place. Pre-cast work designed for a certain purpose is often called upon during handling, stacking, hoisting and fixing to bear strains quite foreign to its designed purpose, and defects are likely to be thus contracted and the reinforcements opened up to attack even where the defect is only a hair crack.

We really do not know how dangerous this may be as our experience of this class of work is limited to a comparatively short period.

The elimination of centering is, of course, a great advantage, which often turns the scale in favour of pre-cast work when judgment is in the balance, but generally for the ideal finished job give me the floor cast *in situ*.

"CONVINCED."

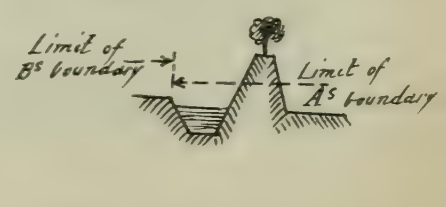
Boundaries.

SIR,—I have an estate on which there is a dispute *re* boundaries. "A" claims that his boundary is the ditch on the other side of the hedge, whilst "B" claims that his boundary is up to the hedge. "A" claims that the owner of the hedge claims the ditch on the other side of hedge as being the boundary.

Please state which is legally correct, as the deeds of neither land sketches the boundary clearly.

"A," DURHAM.

[REPLY TO "A," DURHAM.]



SIR,—When a hedge or fence has a ditch, or the remains of one, on one side of it, there is a presumption that the ditch with the bank and hedge or fence belong to the owner of the land on the opposite side of the fence; and that his boundary is the edge of the ditch farthest from the fence. The reason given is, that if "A" makes a ditch and fence, it is easier for him to dig the ditch at the furthest limit of his land, and to throw the soil dug out on to his own land, than to dig the ditch at some distance from the limit of his land, and to throw the soil towards "B's" land. The probability of trespass in the former case is less than in the latter case. (See Vowles *v.* Miller (1810) 3 Taunt 137.) It has been said that the hedge and ditch boundary is a survival of an old custom. It is doubtful, however, if this presumption is applicable when it is not known that the ditch is artificial. (See Marshall *v.* Taylor (1895) 1 Ch. 641, C.A.)

Acts of ownership, such as trimming the hedge and cleaning the ditch, are *primâ facie* evidence that the person exercising them is the owner of the hedge and ditch; but, even when such acts are exercised for many years, the presumption above referred to is not necessarily rebutted. Especially would this be so if the acts were done without knowledge on the part of the adjoining owner. (See Henniker *v.* Howard (1904) 90 L.T. 157.) If both "A" and "B" concurrently exercise acts of ownership it is evidence of a tenancy in common in the bank hedge and ditch.

An impression prevails that the owner of a bank hedge and ditch is entitled to certain allowances therefor, *e.g.*, when the hedge and ditch boundary is between fields belonging to different owners 5 to 7 links, and when abutting on public lands 7 to 10 links. Apart, however, from any local custom, there is no rule to this effect. (See Vowles *v.* Miller *supra.*)

In Collis *v.* Amphlett, 1920, A.C. 271 H.L., there was a map on which boundaries were delineated by a line drawn along the line of the "growers" in a hedge dividing a common from the land of an adjacent owner and belonging to such owner. It was held that there is no presumption that the owner is entitled to a "ditch width" on the outside of the line of the "growers," in the absence of evidence, that the hedge was originally planted inside the boundary line, and when no "ditch width" was found to have existed.

It follows from above, that in the absence of direct information as to the boundary, that "A" owns the bank hedge and ditch; and that there may be a local custom giving a "ditch width" of from 5 to 10 links thus:—

ANCIENT EGYPTIAN ARCHITECTURAL CRAFTSMANSHIP

At a meeting of the Architectural Craftsmen's Society held in the Royal Technical College, Glasgow, recently, Mr. Wm. J. Smith, A.R.I.B.A., delivered a lecture, illustrated by lantern slides, on this subject. In the course of his remarks he said they could not appreciate the work of the ancient Egyptian architectural craftsmen without considering the peculiar conditions—geographical, social, and religious—which influenced in such a remarkable degree all their artistic efforts. The various materials, the architectural system, and the particular buildings which gave these craftsmen their glorious opportunity must also be considered if they were to get the most out of the study of their work and arrive at a true estimation of its value. The great craftsmen of the past, builders, sculptors, and painters, were not conscious of the high standard of their craftsmanship. They were intent on the immediate work they had in hand.

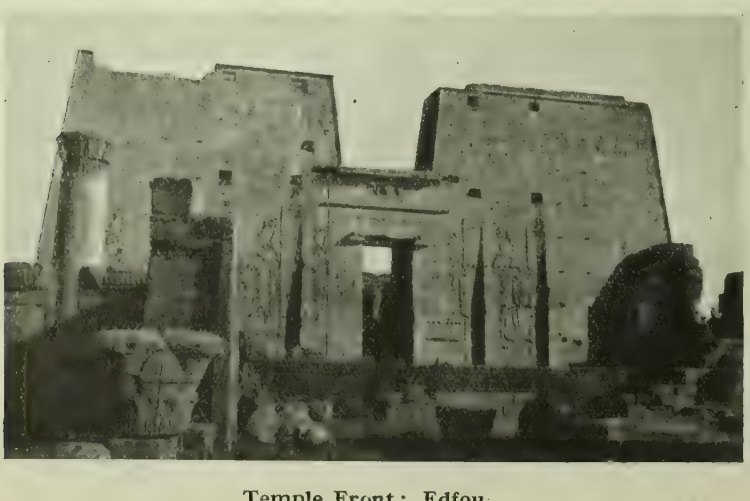
Court of Amenophis III: Temple of Luxor.

Their best efforts were bent on doing that work as well as they possibly could, and it was only subconsciously that as they worked some expression of their own feelings crept in and made it art. A great work of architecture expressed not only the conception of the architect, but also told them something of all those groups of workers associated with it. The great buildings of the past were the best possible index to the spirit of the age in which they were constructed. Craftsmanship was described as "the ability to do work well and skilfully," which was all right so far as it went. But real craftsmanship was something much more than that. To do work well required skill with the hands and the use of the brain, but craftsmanship in the fullest sense required also a touch of the heart, for love, beauty, and truth were enthroned there, and man made beauty of that which he loved. It was that touch which gave breath to their handiwork and enabled it to live even after their death.

In Egyptian construction all pressures were vertical; there were not thrusts outwards, and they had absolute equilibrium. The general impression was that the structures were built for eternity, as the Pharaohs themselves intended. Stability in its highest and most simple forms was the distinguishing characteristic and the true originality of all Egyptian work. All temples were more remarkable for the ground they covered than for their height.

The Egyptians varied the design of their buildings, the arrangement and proportion of their columns, and the form of decoration in many ways. By fertility of imagination and continual striving after improvement, the ancient craftsman showed that he was by no means bound by that blind respect for tradition too often attributed to him. The execution and erection of obelisks testified to

A modern designer would probably ha made a mess of the problem of the simp



One of the Colossi of Rameses II, in the Court of Rameses: Temple of Luxor.

treatment of mass so brilliantly solved by the ancient architect.

The story of the social life and habits of the people could be read from the beautifully executed decorative painted wall reliefs, to be seen in the rock-cut tombs, like that of Tutankhamen's, in the Valley of the Kings tombs. But they returned to the temple for really great work. It was difficult to give any idea of the grandeur of the remains of the great Hypostyle Hall of the Temple of Amon, at Karnak.

The whole combined to stamp this as one of the greatest of man's architectural works. They were indebted to this early civilisation for the lesson of gigantic scale and "monumentality," and, as a modern writer put it, "architecture was, to a large extent, an Egyptian art."

THE BUILDING TRADE

THE LAW RELATING TO BUILDING

By W. T. CRESWELL, Lic.R.I.B.A., F.R.San.Inst. (Barrister-at-Law).

X.—THE CONTRACT.

Documents Essential to a Contract.

A number of documents may be included in a completed contract, even if it can be seen that there is an intention therein that a formal contract is to be entered into later. The documents must be linked together, that is, must refer to one another and must contain all the essentials of a contract amongst themselves as a whole, *i.e.*, offer and acceptance. If they form a completed contract, either party cannot object to the introduction of additional terms or conditions in a formal contract subsequently drawn up.

Simple Contracts.

Simple contracts, whether written or parol, depend for their validity on the presence of consideration; whereas, a contract under seal holds good without any consideration being involved. The law does not weigh the adequacy of the consideration, only its reality; and if it is worthless, it does not invalidate the contract. Some simple contracts must be in writing, *e.g.*, bills of exchange and promissory notes and acceptance of bills; assignments of copyright; acknowledgment of debts barred by the Statute of Limitations; some contracts which come under the Statute of Frauds, sec. 4, *e.g.*, a promise by an executor or administrator to answer for damages out of his own estate; a promise to answer for the debt, default or miscarriage of another person; an agreement made on a consideration of marriage; a contract concerning, for the sale of, lands, tenements or hereditaments, or any interest in or concerning these; agreements not to be performed within the period of one year from the making thereof.

Building Contracts.

Contracts to construct buildings are usually in writing, though this is only legally demanded when they fall within the Statute of Frauds, the Sale of Goods Act, 1893, or are made with a corporation, which must contract by writing under seal. Contracts for work, labour and materials, used in the work, are contracts for the sale of goods, and therefore need not be in writing.

In Lee *v.* Bulmer (1843) 11 M. & W. 243, a contract in connection with the buildings of a pump engine at a colliery, Parke B. said: "The question here is whether it is correct to describe this as a debt for a main contract for goods sold and delivered. We think it is not. The engine was not contracted for to be delivered as an engine in its complete state and afterwards affixed to the freehold . . . but was contracted as an engine sold and delivered." And the judgment was that as being a matter of work labour and materials, the contract did not become under the Sale of Goods Act, 1893. But a contract for the sale of the material from a demolished house (where the ground was to be clear by a given date, and where the contractor's right of access was limited and all remaining materials on the site to be forfeited) was held to come within the Act and to be a contract for the sale of goods. It appears that a contract for the sale and preparation of plans is a contract for the sale of goods and must be in writing.

Contracts under Seal.

Some contracts must be under seal, *e.g.*, leases for more than three years, contracts with corporations, etc., verbal contracts, parol evidence.

The determination of the terms of a verbal contract are, when in dispute, at the discretion of the jury. See Bowes *v.* Shand (1877) 2 App. Cases 455. A contract, partly verbal and partly written, is also defined by the jury. See Moore *v.* Garawood (1849) 4 Exh. 681.

When once a contract has been reduced to writing and is a complete contract, the Court will not accept as evidence any previous negotiations or extensive declarations to alter the terms contained in the written document. See Lewis *v.* Nicholson (1852) 18 Q.B. 503.

Parol evidence is, however, admissible to show that a new or supplemental contract has been entered into. See Bush *v.* The Trustees of Port and Town of Whitehaven (1888) 52 J.P. 392. Also to show the existence of any local or trade custom which tends to modify the meaning of special words or terms in the contract, or to explain "latent but not patent ambiguities." In Symonds *v.* Lloyd (1859) 6 C.B. (N.S.) 891, there was a contract to build certain walls in which were these words: "for the sum of 3s. per superficial yard of work 9 inches thick, and finding all materials. . . ." The lower part of the walls causing the dispute was of stone two feet thick, to a height of eleven feet, the remainder of the walls was of brick 14 in. thick; evidence was admitted that the local usage was to reduce all brickwork, for the purpose of measuring up, to terms of 9 in. thickness, but not to reduce stonework unless when exceeding two feet in thickness. It was held that the brickwork was to be paid for under the clause quoted, but the stonework was to be valued on a quantum meruit.

In New Zealand *v.* Simpson (1900) A.C. 182, Lord Davey said: "Extensive evidence is always admissible; not to contradict or vary the contract, but to apply it to the facts which the parties had in their minds and were negotiating about. . . Of course, if the words in question have a fixed meaning, not susceptible of explanation, parol evidence is not admissible to show that the parties meant something different from what they have said."

Blank Spaces in a Written Contract.

When blank spaces are left in a contract the Court does not admit parol evidence as to intention: if such evidence would define the missing data so as to put onerous conditions on either party. See Kemp *v.* Rose (1858) 1 Giff. 258.

Erasures and Alterations.

Only when these have been made previously to the signing of the document by both parties do they stand. Obviously, therefore, all erasures and alterations are likely to lead to dispute, and should be avoided; or, if absolutely unavoidable, should be initialled and even dated by the parties.

In Pattinson *v.* Luckley (1875) L.R. 10 Ex. 330, the plaintiff had executed building work for the defendant and sued for certain payments beyond those certified by the defendant's architect. The defendant pleaded the written conditions, in which there appeared an erasure in a material part. The jury found that this erasure had been made after the builder had signed the conditions; and the builder contended that the document was therefore voided. The Court held that the conditions in the document were still to be considered in deciding what were the real terms of the contract, and that the plaintiff (the builder) was entitled to recover payment. It is the duty of the Court to construe all disputed documents, when the true meaning of the words is established, and after all circumstances have been considered; and it is the duty of the jury to accept their construction. See Neilson *v.* Harford (1841) 8 M. & W. 823; also Lyle *v.* Richards (1866) L.R. 1 H.L. 222.

Lost Documents.

The Court will reconstruct a lost document on evidence forthcoming from other documents or from parol evidence. See Berwick *v.* Horsfall (1858) 4 C.B. (N.S.) 450.

Deciphering of Bad Writing; or Insertion of Omitted Words.

This is the duty of the Court and not of the jury. See R. *v.* Hucks (1816) 1 Stark 521. The Court corrects all clerical errors in dispute.

Discrepancy between Documents of the Contract.

All documents, plans, specifications, etc., are construed, one with the others, by the Court. See Rex *v.* Peto (1826) 1 Y. & J. 37.

Printed Forms of Contract.

There are to be obtained printed forms of contract for use in building agreements; words of generally accepted meaning are used; the general terms are printed and spaces left for particular terms, amounts, etc. The oldest issue is by the Institute of Builders. That issued by the Royal Institute of British Architects is in general use.

In case of discrepancy between the printed and written matter, the Court will give special importance to the written words as showing the considered intention of the parties, and as having been selected advisedly. See Glynn *v.* Margetson (1893) A.C. 351.

The grammatical and ordinary use of words is accepted by the Court in construing or interpreting such documents; unless such grammatical and ordinary use would, read in conjunction with written words inserted, create an absurdity or obvious duress, when the meaning may be modified within the limits of other admissible evidence.

Technical Words and Terms.

These are construed in their meaning as accepted in the particular trade or profession involved. See Mollan *v.* May (1844) 13 M. & W. 511.

The meaning of technical words is for the decision of the jury. See Hutchison *v.* Bowker (1839) 5 M. & W. 535.

Words not Struck Out.

If the intention shown in the rest of the document proves that certain printed words should obviously have been struck out, and they are inconsistent with other written words, they will probably be rejected by the Court. See Western Assurance *v.* Poole (1903) 1 K.B. 378.

Novation.

When a new party is substituted for either of the original parties to a contract, there is what is termed "Novation of the contract." The use of this term used to be restricted to these circumstances; but now its use is extended to cases where terms or conditions, which go to the root of the original contract, are substituted by other terms or conditions.

Becontree Estate.

At the recent conference of the British Legion the Becontree branch moved that the conference viewed with alarm the amount of rent charged by the London County Council for tenements erected on the Becontree estate, and asked that representation should be made to the London County Council with a view to a reduction of 50 per cent. being effected. By an amendment from Hull similar action was asked to be taken in all districts where it was considered exorbitant rents were charged by local authorities.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

The first business of the House of Commons, on reassembling after the Whitsuntide recess, was to consider the amendments made by the House of Lords to the Prevention of Eviction Bill. These amendments were all eventually rejected, and the Bill will be resubmitted to the Lords in practically the same form as that in which it first left the Commons.

The Gretna Factory.

Replying to a question from Mr. T. Johnston, Mr. W. Graham (Financial Secretary to the Treasury), said that there were at present 25 brick houses and 80 wooden bugalows vacant at Gretna, and 48 brick houses and 59 wooden bungalows at Eastriggs. He was advised that reasonable steps had been taken to prevent these houses falling into disrepair. No applications have been received for small holdings by the Disposal Board.

Replying to supplementary questions from Mr. D. G. Somerville and other members, Mr. Graham said he would be delighted to let the houses if he could find tenants. Advertisements had been inserted in the newspapers, and they were unable to do any more than they had done. The rents of the houses were no higher than were usually charged in the district.

The Size of Bricks.

Mr. J. Sunlight asked leave to bring in a one-clause Bill to fix the dimensions of bricks used in State-subsidised housing schemes. He explained that the measure would increase the size of these bricks to 9 in. by 4½ in., by 3½ in. thick. By the Bill it would be possible to augment by one-fifth the quantity and volume of brick-work without the addition of a single bricklayer and without any cost to the State. He mentioned that last year he was engaged in the reconstruction of a beautiful classic building in Manchester, where the bricks were 4 in. thick. He discovered later that the builder was a Scotsman. As to the saving to be effected by his proposal, he claimed that on a £500 cottage there would be a saving of £30. The Minister of Health had introduced a Bill to control the prices of building materials, but he had made no provision against bricks being reduced in size.

Mr. D. G. Somerville, in opposing the Bill, said it contained one of the most extraordinary proposals that had ever been put before the House. If there was any reason for increasing the size of bricks, why did not Mr. Sunlight go a step further and provide that bricks should be 1 ft. or 2 ft. thick; or why did he not make it necessary to use one brick only by casting a brick the size of one side of a house? The Bill would dislocate the trade and would add to the cost of building by imposing obligations on the trade. The proposition was absurd.

Leave was granted to introduce the Bill by one vote—140 to 139. The measure was then brought in and read a first time.

Wooden Houses for Leicester.

Leicester Housing and Town-Planning Committee has accepted a tender for the erection of 100 wooden houses, at just over £400 each.

Builder's Estates.

Mr. William Green, of 8, St. Andrew's-villas, Clewer, Berks, builder, £13,396.

Mr. Joseph Howard, of Wigan, Lancashire, builder (net personalty, £4,460), £8,001.

Mr. Henry Dean, of Linthorpe, Middlesbrough, retired builder (net personalty £8,863), £13,763.

Mr. Edward Howard, of Upper Dicconson-st., Wigan, builder, a prominent local Roman Catholic (net personalty £4,460), £8,001.

NOTICE TO DETERMINE MONTHLY AND WEEKLY TENANCIES

IT is a very remarkable thing that there should be some uncertainty in the law as to the nature and length of a notice to determine monthly or weekly tenancies, but such is the case, and it is recognised in the text books and was commented upon by Mr. Justice Lush in the recent case Queen's Club Gardens Estates, Ltd., *v.* Bignell (1924, 1 K.B. 117).

We commented upon this state of the law in our note to the case Simmons *v.* Crossley (1922, 2 K.B. 95) in our issue May 5, 1922. That was a case somewhat unusual in its facts as the tenancy was a monthly tenancy and the landlord had given the tenant six months' notice to determine it, and it was contended by the tenant that this notice was bad because the notice expired on a day other than the last day of the month, as calculated from the commencement of the tenancy, and the Divisional Court held that to determine a monthly tenancy all that was required was a reasonable notice, and the notice in question was not unreasonable because it expired on a day other than the last day of the monthly period calculated from the commencement of the tenancy. In our note to that case, however, we pointed out that whatever uncertainty there might be in the law, the general practice was to determine a monthly tenancy with a month's notice, and a weekly tenancy with a week's notice, to determine on the last day of the tenancy, and that is the safe course to adopt.

The whole question has again come up for consideration in the above case, Queen's Club Gardens Estates, Ltd., *v.* Bignell, and in connection with a weekly tenancy, but before a Divisional Court, that is a Court of concurrent jurisdiction with that which decided Simmons *v.* Crossley, and therefore without authority to overrule the decision in that case.

The case is one of complication involving points under the Rent Act, but in the present note we are confining our observations and the statement of the facts to this question of notice alone. The defendant was a weekly tenant, and had been so for some considerable time, the tenancy having commenced on a Saturday. On October 6, 1922, which was a Friday, notice in the following terms was given in writing, "The Estate Company hereby give you the requisite week's notice for the termination of your tenancy one week from Monday next, on or before which date they will require vacant possession."

The Court intimated that this last paragraph of the notice, "on or before, etc.," would probably make the notice bad for ambiguity, but it did not rest the decision upon this, as it held the notice bad on other grounds.

It was a notice given on Friday to determine on Monday a tenancy which commenced on Saturday, and it was held bad because it ran into another week.

Mr. Justice Lush, after saying that it seems strange that the law should still be in uncertainty with regard to the necessary requisites of a notice to quit in the case of a weekly tenancy, states the points to be considered, thus:—(1) What length of notice to quit must a landlord or tenant give to determine a weekly tenancy? (2) Must the notice expire at the end of the weekly term or may it expire during the currency of that term?

It may be said here that it was intimated by the Court that whatever principle applies to a weekly tenancy will apply to a monthly tenancy. As regards the first point, the length of notice, as the Court pointed out, there are cases to be found in the Reports laying it down that in a weekly tenancy the notice must be a week's notice, half a week's notice, more than a week's notice or a reasonable notice, but the Court now held that in the case of a weekly tenancy the notice must be a wee notice.

The second point as to whether the not must expire at the end of the current w the Court considered more serious, but Court held the notice must expire at the of the week.

The Court, in coming to these conclusio differed from the finding of the Court Simmons *v.* Crossley that the notice m only be a reasonable notice and that such notice would not be bad because it did coincide with the period of the tenancy, b as we have said, being a Court of concurre jurisdiction, it could not overrule that cision, and therefore until the point com before the Court of Appeal the question ca not be considered as having been set at re The Court, however, gave detailed a weighty reasons for its decision, and careful analysed the decisions, on which Simmons Crossley had been based, and as far as weekly tenancy is concerned this case will the authority which must be followed, Simmons *v.* Crossley did not directly turn a notice required in a weekly tenancy.

The finding is really satisfactory as brings the weekly, and, inferentially, th monthly, tenancy in line with tenancies suc as yearly and quarterly tenancies so far notice is concerned, and now that notices quit are so very material in connection wit Rent Restriction it is very important that th law on this point relating to weekly tenancie should be settled and understood.

One or two general observations on the sub ject may, however, be useful.

As we have shown, the case decides that determine a weekly tenancy the notice mus be a week's notice, and the notice must expir at the end of a week, but, it may be asked does a week's notice mean a notice given pre cisely a week before the expiration of th term, or can a week's notice be given a some time before the last week commences?

Mr. Justice Salter, in the judgment he de livered in this case, pointed out that no que tion had been raised that the notice to quit wa either too short or too long, and he should sa nothing about that, but the point seems in ferentially decided by Mr. Justice Lush, for h is reported as saying, "If the party who desire to give notice is doubtful as to the day on whic the period expires he can make sure that th notice will be valid by adding the words tha are given in the common notice to quit, to the effect that if the date mentioned is no the real date on which the period expires the the notice to quit is to expire on the prope day of expiry next after the expiration of th current period" (and see May *v.* Boro below).

Therefore it appears the exact date of th notice before the period in question, provide the notice is of proper length, is not material but the notice must end with the period, an the reason for this was also given by th Court, for if the notice expires after the perio has determined then another period has com menced, and there would be difficulty as t the rent, which is only due at or in respec of a period.

We have endeavoured to make the point raised by this most important decision clear and it decides the law to be as we suggested it was in our note of May 5, 1922, but until a de cision has been given by the Court of Appea the matter cannot be considered as finally settled in view of the divergence of view ex pressed by the two Divisional Courts in this case and in Simmons *v.* Crossley.

Since this note was written there has been a further decision of a Divisional Court, but differently constituted, on the subject of a monthly tenancy (Precious *v.* Reedie, *The Times*, April 15). In that case the monthly tenancy commenced on the first of the month, and a notice dated September 1, but only served on the tenant on September 5, had been given: "I hereby give you one month's notice to quit 5, Commercial-street, as I require the house for occupation." The county court judge had held that this was a good notice for the end of the

ensuing month of the tenancy, viz., r 31, and Crossley's case and Bignell's had been cited to him, but he had pur- to follow the case of May *v.* Borup 1 K.B. 830). That was a case of a tenancy which under the agreement be terminated by six months' notice given rch 1 or September 1, and a notice given ember 23 to quit "at the earliest possible nt" was held to be a good notice to deter- he tenancy at the expiration of six months March 1. It will be seen that this case is ally dealt with by the Court in Bignell's the observations we make above. The nal Court in the case we are now con- g (Precious *v.* Reedie) reversed the ent of the County Court judge, and ing Bignell's case held that in a monthly y the notice must correspond in length he period of the tenancy and must ter- e on the day of the month on which the y commenced: thus following Bignell's nd definitely applying the principle there own in a weekly tenancy to a monthly y.

NEW BUILDINGS IN LONDON

nhill.—Building.—A building for the h and Foreign Marine Insurance Co. is erected at 45, 46, 47, Cornhill, E.C. It e a steel-framed building, faced with Port- stone, granite plinth, reinforced concrete and staircase and roof, back elevations with white glazed bricks. The general actors are Messrs. Trollope & Colls, Ltd., of leman-street, E.C. The steel-framing is carried out by Messrs. Redpath, Brown . Most of the sub-contracts have been ged. Messrs. Campbell Jones, Son & ers, of 9, Dowgate-hill, Cannon-street, are the architects.

rough.—Factory.—A new factory is being for Messrs. Upsons, Ltd., at 311–317, igh High-street. The architect and sur- is Mr. S. C. Addison, of Eastbourne. The ing is a steel framed construction with ete floors. The front is in brickwork and ial stone. The sub-contractors are: Steel- and fireproof floors, Messrs. Archibald D. ay & Sons, Ltd.; patent artificial stone, Patent Impervious Stone Co., Ltd.; steel ents, The General Iron Foundry Co., Ltd.; lte work, Messrs. Thomas Faldo & Co., ; fireproof staircase, Messrs. F. A. Norris . The general contractors are Messrs. s Bodle, Ltd., of Eastbourne.

BY MASTER BUILDERS' ASSOCIATION.

Derby Building Costs.

e Derby Master Builders' Association tly published a statement in reply to the h of Alderman W. R. Raynes in the House mmons, in which the latter, referring to the of building houses in Derby, asserted that ontractors' price, when the contractors had eld to themselves, was reduced only to £715, mmediately a contract had been let at that the Corporation, by direct labour, built es at £424 each. Mr. Porter, Secretary of Derby Master Builders' Association, states six months before direct labour entered into etition the contractors' price had been ed to £356 10s. per house. Further, it was uch inaccurate statements that Alderman nes and others endeavoured, both locally in Parliament, to bolster up Socialism in orm of direct labour, and to make the c believe that this system was for the fit of the community.

Building Trade Wages.

a meeting of the National Joint Nego- ng Committee, held in London on day, an agreement on building trade s was reached, to take effect immediately. ils are not available at the time of going ress.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick-layers.	C'p'ters, Joiners.	Plas-terers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Altrincham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½

(For rates of wages in the Building Trade in Scotland, see page 1,000.)

CONTRACTS, COMPETITIONS, &c.

Forsome contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders: and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

The M.H. has sanctioned a loan of £88,050 for the erection of 200 houses on the Lupset Estate. The M.H. has given sanction to a loan of £7,750 for the erection of 20 houses on the Oak Frame and Ketton Stone principle on the Lupset Estate. Application is being made to the M.T. for sanction to the scheme for the widening of Doncaster-road between the White Bear Inn and the canal bridge.

WAREHAM.—Plans passed by T.C.: Mr. Burgess, house, Roper's-lane; Mr. Marsh, pair of cottages, New-street; Electric Light Co., house near their works, West Walls.

WARWICK.—The C.C. has prepared plans for two houses at the Mental Hospital, at a cost of £2,500. Plans passed by T.C.:—Two houses, Greville-road, for Mr. L. Middleton; two houses, Beauchamp-road, for Messrs. Crosbee & Atkins. The accommodation at Westgate School is to be increased by 80 places.

WATERLOO.—The U.D.C. have agreed to sell building land for houses in Brook-road, to Mr. W. H. Chorley.

WEST BRIDGFORD.—A children's corner is to be made at the recreation ground by the U.D.C., at a cost of £343. Plans passed:—House, Valley-road, for Mr. J. Wood; 24 houses, Willoughby-road, for Messrs. Forman & Linacre; house, Adbolton-grove, for Mr. J. Sands; house, Stamford-road, for Mr. H. H. Atkin; four houses, Willoughby-road, for Mr. F. Haskard; house, Wilford-lane, for Mr. W. P. Buckland; house, Melton-road, for Mr. H. Cox; house, Radcliffe-road, for Mr. F. G. Beeson; transformer house, The Park and Loughborough-road, for the Nottingham Corporation Electricity Department.

WEYMOUTH.—Plans passed by T.C.:—S. J. Board & Son, Villa in Belle Vue-road, Bincleaves. The M.H. has sanctioned loans of £1,926 for the extension of the outfall sewer, and £1,846 for wood-paving works. The Borough Surveyor has been asked to report upon flooding in some of the streets.

WHITEHAVEN.—The T.C. has decided to grant the application of the Whitehaven Colliery Co. for an advance by the Council, under the last Housing Act, of 90 per cent. of the cost of building 500 houses required for additional workmen in connection with colliery development. The Council has also decided to construct a new road to Kells, to provide for the growing population, at an estimated cost of over £10,000.

WILLINGTON.—The U.D.C. has decided to build an additional 60 houses on the Council housing site.

WILMSLOW.—A new sewer is to be installed at Finney Green, estimated to cost £700.

WIMBORNE.—A new R.C. church is to be erected on a site at Leigh Park.

WOKING.—The U.D.C. is negotiating for land at Connaught-road for a fire station. Plans recommended:—Mrs. F. Manton, bungalow, Lower Knaphill; Miss Fulford, detached bungalow, at Kingfield; Mr. Gettings, house, at Kingfield; Mr. Michie, house, at Kingfield; W. G. Tarrant, Ltd., house, Hockering-gardens Estate; Philip L. Beall, house at junction of The Drive and Cedar-road, Hook Heath; J. H. Tucker, house on the housing site, Broadway, Knaphill; C. E. Mutter, house, Triggs-lane, Star Hill; Surrey E.C., caretaker's cottage in connection with the Secondary School for Girls, Park-road; A. Griffiths, preliminary plans for a shop and house at The Broadway, Knaphill. The Surveyor has been instructed to prepare plans for a new bridge. Plans have been prepared for widening Goldsworth and Commercial-roads, at a cost of £4,340. Plans have been passed for 56 houses on the Council's estate.

WYKEN GRANGE.—The B.E. has passed plans for a new school.

YORK.—The scheme for a new public library for York has been sanctioned, and will be carried out subject to the grant from the Carnegie Trust of £12,000, on a site chosen in Museum-street.—The Housing Committee has been informed of a proposal to erect on Knavesmire a concrete house for exhibition at the Great Yorkshire Show, and is endeavouring to arrange for the house to be erected in such a position so as to enable it to remain after the conclusion of the Show.

FIRE.

PONTADULAIS.—Damage estimated at £15,000 has been done by fire at the premises of Messrs. Parry & Powell Reynolds, Glandulais, Pontadulais (Glam).

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

L. CXXVI.—No. 4247. JUNE 27, 1924.

THE POLITICAL HOUSE.—II.

IT is a common complaint against the political reformer that he is apt to be over-zealous in fashioning what he believes will be good for posterity, forgetting that this is the usual method of doing honour to the failures which posterity has handed down to us.

From a layman's point of view, the housing problem has scended by easy stages, until it now seems to be solely a litical issue. The main ideals may not have gone, but they ve become obscured in a welter of statements upon ways d means. We had hoped that the whole question of housing uld be kept above party issues, but it seems impossible to scuss it without trespassing upon political grounds. As a litical counter the housing question does not interest us, yond the fact that it is of vital importance to the architect d the constructor. We cannot believe that it is in the interests the building industry to read in the same newspaper a dis- ssion upon the new Housing Act, an article upon the building ade connecting the wages dispute with the huge housing pro- amme, and an article upon building materials under the usual are caption, "Is a price ramp holding up housing?" The hole formula of this absurd performance has become stereo- ped, and we wonder how long the nation will tolerate it.

In controversial matters there is always a tendency to nceal questions of ends, and to pretend that every question one of means only. We are not surprised, therefore, to find at the political aspect of the question of housing is largely matter of trying to disguise irreconcilable differences.

Mr. Norman Campbell in his book "What is Science?" iscusses this tendency in politics. "It is clap-trap to announce rtentously that we all desire the welfare of the community nd to pretend that we differ only in our view of the best way f attaining it; what we really differ about is our ideas of the elfare of the community; we disagree as to what is the state f society that forms the end of our political action. If we could gree about that, our remaining differences would not excite uch heat."

We assume that a certain number of houses must be built rgently, but we know they are bound to be a financial failure nder existing conditions, regardless of any political party. his is the whole position and it seems to us to be unwise to ssume that a permanent solution has been found, and that it an be applied to a temporary condition. The claim of the olitician to be able to provide houses in large or small quantities s based entirely upon how he interprets the law of political conomy. The capacity for giving, as we might term it, is olely a matter of the amount of taxation we can afford to pay, r rather the amount we can be made to pay. To prevent the roblem appearing too simple doubts are raised whether those vho pay the tax are those who receive the benefits. There is no ikelihood of this point being established, but if it were, the real ousing problem would emerge. Discussion upon the housing uestion has hardened into a jargon, and the conflict between nd and means has now obscured certain ideals and turned he problem into a complicated issue. We believe we are radually reaching a stage in this question when larger issues nust be faced. The responsibility for providing houses is radually passing from the individual to the State or local uthorities, and there are many indications which show that his responsibility may become a permanent condition of our ocial state. The idea is not far-fetched; on the contrary, it is eing seriously considered by many thoughtful people. We an see a state of society which may not accept a sharp division n the allocation of state services, and we can see little scope for private ownership in competition with large vested and public ights. On the other hand, it would be idle to deny that large possibilities are opened up which might be beneficial to the social state.

Apart from the question of immediate housing accom- modation (which, we admit, is serious), the politician must sooner or later face the fact that "the lower middle class," who can just afford to pay an economic rental, have at least as much right to expect the architectural and material advantages of a Government housing scheme as the "labouring" classes who cannot afford to pay. The argument is capable of further development, when we realise that where there is no obligation on the individual to build there can be no limit to the responsi- bility of the Government. This is merely another instance o how the housing question, as an ideal, can be obscured when the main object is to supply houses.

The only political contribution which appeals to us, from a constructive point of view, is that by Mr. E. D. Simon, who advocates that new houses should be free from a portion of the local rating. Theoretically any financial advantage granted to housing must be paid by someone; it is merely a question of the distribution of the burden. There appears to us to be a sense of justice in the theory that a housing shortage in any particular city has a greater significance for that city than for other districts where the problem is less acute. It is generally agreed that a city has a direct interest in the industries which have induced the workers to live in that particular city. Local rating increases the rents by roughly 50 per cent., so that if local authorities are compelled to accept responsibility for housing, partly because of the high rates, we may reasonably hope to see a tendency towards economy in local administration.

We recognise that under existing conditions any govern- ment is compelled to carry out its housing schemes in the teeth of strong opposition. A government may create the impression that it is anxious to build, but the truth is, the public realises there is an obligation to build, and is naturally anxious on that account. Problems of labour supply and shortages in certain materials are in the ordinary way the mathematical result of economic forces, whereas we are now dealing with a housing pro- gramme based upon artificial conditions throughout. The situation into which the building industry is driven is the direct result of political forces, and its attitude in the circumstances is what any economist would expect.

On several occasions attention has been drawn in the public Press to the high rates of wages in the building trade as com- pared with other trades, and to the stringent conditions regu- lating the supply of labour. The question of wages may appear to be a matter between the masters and workmen, but in a free market it would have been settled long ago by the consumer. This is the penalty which must be paid for any dislocation of economic conditions. We do not question at the moment the wisdom of the policy which set up these abnormal conditions, but we are fully aware that many advantages have been enjoyed which the general public is inclined to forget. On the other hand, we take a broad view of the welfare of the building industry when we say that the spending of hundreds of millions of public money gives the public the right to be critical, and it is as well to recognise that the general attitude is one of hostility. It is beyond doubt that the building industry occupies a very strong position, and it is because of this that its attitude requires serious consideration. It is, for instance, by no means certain that an ambitious and permanent form of building is the correct solution for the existing conditions, and if we are to visualise a programme requiring subsidies fifteen years ahead, we cannot rule out the possibility that the scientist may invent a form or type of building requiring so little skilled labour to erect that the annual saving on capital might reduce the cost to nil in, say, fifteen years. Some day a rational method of clearing out the slums may be discovered, when it is not worth while to be constantly repairing them.

These doubts and fears will, we hope, turn out to be idle speculations, and it is certain they will be if we have not to wait too long for the return of a "free market" in the economics of building. Meantime, we would prefer to see the Government taking the short view in its housing outlook, and the building industry the long view. The public is fairly safe in assuming that the long view of the Government will not continue for long to coincide with the short view of the building trade.

NOTES

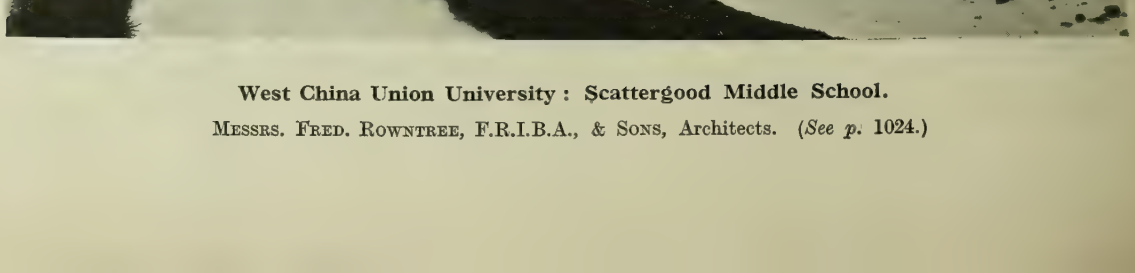
Architectural Liberty.

THE admirable letter in the *Times* by Prof. Beresford Pite on architectural liberty seems to have evoked much interest. A correspondent writes: "We must all realise that whatever we do to promote the well-being of the art and of those who practise it, we cannot expect the double object to be attained with equally satisfactory results. The material success of the architect cannot be made a dominant motive without some loss to art. We are now in for a policy of protection for the practice of architecture, but no policy can possibly ensure us good art. As George Gilbert Scott said years ago, 'Art is by the way,' a product of value which cannot be bought and paid for. It is a tender plant apt to wither and die under the irritating influences of examinations and bills of account, and we are probably getting as much artistic value to-day as one can expect under modern conditions. No safeguards and no systems we can devise will ensure the production of such a building as the new Cathedral at Liverpool, and the most that we can hope for is that guidance and help will be of value to both the mediocrity and the genius. It is well to insist on freedom, for art knows no barriers or law but such as she herself imposes." No one wishes the establishment of registration to exclude those who have a genius for art from practising the art of architecture, and, as Mr. McArthur Butler suggests, it may be quite possible to devise a method under registration which shall give us that freedom which Professor Pite claims to be essential.

The Public Interest.

IN speaking at the R.I.B.A. general meeting at Caxton Hall, Mr. Delissa Joseph said Parliament would only grant registration where "the public interest was in jeopardy," and he suggested that, so far as architecture is concerned, the public interest was not in jeopardy. Few architects will be found to agree with this contention. The word "interest" does not apply only to the commercial and the material. It is as much in a man's interest that he should be educated as that he should be protected from violence. To suggest that so long as sanitation and personal safety are ensured the public interest is fully protected is unduly to curtail the meaning of the word, and, what is more, it leaves out its most important application. The public is already sufficiently blind to its true interests and rights in matters of art, and it will be unfortunate if a limited outlook is encouraged by architects themselves.

The Housing Bill.



AFTER a very interesting discussion the Housing Bill of the Government passed the second reading in the House of Commons on Monday by a substantial majority, but the Government was subsequently defeated in resisting the motion to refer the Bill to a Committee of the whole House instead of the smaller Standing Committee which they proposed. This decision, it is to be hoped, will ensure an adequate discussion of the Bill in detail, for although the debate has shown that the desire to assist the Government in their zeal to provide a large number of small houses will not be allowed to prevent a thorough discussion of their scheme, the discussion on details will show whether the Bill is to be used as a party weapon or not. In our judgment the Bill has radical defects which in the interests of the country as a whole, apart from sectional interests, should be drastically dealt with. From the time housing became a political question the difficulty of providing houses has increased, and even now we doubt whether any party has explored the problem thoroughly. Would a Committee of non-party professional and business men of experience have produced either the Addison or the present scheme? And will the problem ever be solved until such a Committee is formed to deal with it?

Two New Housing Committees.

WE note that Mr. Wheatley proposes to set up two new Committees, the members of which are to be nominated by the building industry; one is to deal with housing labour, and the other with materials. The danger we foresee in the functioning of these Committees, unless the personnel is chosen with unexpected foresight, is that the members will imagine that between them the two Committees will be covering the whole field of housing. We suggest an analogy from the musical world. Imagine one committee to deal with performers, and another to provide the instruments. Would not the appointment of some one to compose or select the music appear to be indicated? In our world we have too often seen the executants each supplying his own music—a catastrophe the repetition of which we sincerely hope Mr. Wheatley will avoid.

Wages Slips on Tenders.

THE proposal of the National Federation of Building Trades' Employers to instruct their members to affix to all tenders a slip providing for adjustments to be made in the event of a rise or fall in wages has been the subject of a conference between the National Federation and the R.I.B.A. The Council of the R.I.B.A. have agreed to this proposal of the National Federation, subject to the following conditions which all Members and Licentiates of the R.I.B.A. are recommended to accept:—(*a*) That if any slips are attached to tenders they should provide only for actual wage increases or decreases to men employed by the contractors or sub-contractors at the agreed standard rates and paid by the hour, and not for

West China Union University: House "B" Gate, from Within.

MESSRS. FRED. ROWNTREE, F.R.I.B.A., & SONS, Architects.

inclusion of overhead charges or fit upon such increases as well. (*b*) at in circularising their members the deration should direct that the in- uction regarding the slip should hold d until March 25, 1925, and should reconsidered at a convenient date prior the above. (*c*) That the slip shall not affixed to tenders up to £2,500, pro- ed that in the case of tenders below 500 a provisional sum shall be included ual to 2½ per cent. on the total tender of which the above increases to men d by the hour are to be met, but such ovisional sum in any event shall not be ceeded.

Proposed Chair of Building cience and Art for Cambridge niversity.

WE are glad to announce that the Institute of Builders is issuing an appeal to its members for the purpose of raising the sum of £25,000 to establish a chair of building science and art at Cambridge University. We derstand that Sir Walter Lawrence, P., a past President of the Institute, d head of the firm of Walter Lawrence Son, Ltd., has offered to give a donation £1,000 towards this object, if nine other ms will subscribe a similar amount.

"Art and ndustry."

THE title of the second toast at the luncheon given at Wembley by the British Empire Gas Exhibit Committee to the architectural profession was eculiarly appropriate and well chosen. ithout art industry becomes a lifeless rm, or at least a purely commercial nd materialistic enterprise; and without ndustry art—and especially architecture remains an unrealisable dream. The as industry should have a great future, eculiarly so in the unique contribution can make towards smoke abatement. r. Goodenough stressed this in his peech; and if the industry can not only rovide gas but also produce adequate upplies of coke, or better still some form f semi-coked coal at an economic price, it will have done as much towards human betterment as any industry has yet had it in its power to achieve.

The Prime Minister on Art.

THE opening of the Contemporary Art Society's Exhibition, the object of which is to raise funds for the purchase of work by contemporary artists of foreign nationality, was made the occasion of a speech by the Prime Minister of a very important character. The catholic spirit of art as a link to bind nations together was emphasised in his speech with much insight and significance. Though this catholic spirit includes no indifference to native tradition and character, it is not helped by insularity any more than by copying the methods of other countries. The sphere of this influence for art should extend beyond national borders, for the best results through a receptivity to all that can enlarge its kingdom. And it is just because beauty is in a sense of no country that the tie of its noble presence embraces the world. At a time, as was pointed out by the Prime Minister, when "the forces which make for division are all too numerous and all too powerful," the influence of art is, owing to the spiritual fellowship it creates, a binding force of the opposite character. We are glad to notice in another sentence of the speech the corroboration of what we have pleaded so often in these columns: "The greatest work that patrons of art could do for the public was in their generation to anticipate the judgment of time and of the crowd." It has almost come to be accepted that the best will hardly receive any recognition in its own time, yet in any healthy condition of national life the very opposite should be the case. It is a notable fact that it is from the Labour Government, through its Prime Minister and others, that the most enlightened statements in regard to the national importance of art should have found expression in recent years, and we cannot do better than quote here the words in which the Prime Minister referred to it: "Economic advantage would never bring peace. What would bring peace was a spiritual fellowship in the pursuit of knowledge, in the exploration of the extraordinary mysteries of life, and in the appreciation of literature, art, and all that was beautiful and satisfied the soul, and which turned the most conservative of them into pilgrims seeking for the ever remote but blessed ideal." The anxieties of the time will not be eased by economic adjustment and reliance on machinery, but on a spirit inspired through beauty to the deeper relations on which life rests.

West China Union University: Administration Gate.

MESSRS. FRED. ROWNTREE, F.R.I.B.A., & SONS, Architects.

GENERAL NEWS

Professional Announcement.

Mr. J. M. Last Keith is retiring from the firm of Messrs. John Slater & Keith, Architects and Surveyors, on June 30. The practice will be carried on at 46, Berners-street under the title of Slater & Moberly, the partners being John Slater, J. Alan Slater, and A. H. Moberly, formerly of 9, New-square, Lincoln's Inn.

Change of Address.

The Architects' and Surveyors' Assistants' Professional Union has removed to 26, Buckingham-gate, Westminster, S.W.1.

R.I.B.A. Conference.

The following programme has been arranged in connection with the forthcoming Conference at Oxford from July 9–12 :—

WEDNESDAY, JULY 9.—Members will assemble in Oxford.

THURSDAY, JULY 10.—10.30 a.m. : The Conference will assemble for the inaugural meeting in the Sheldonian Theatre. Mr. E. P. Warren, F.S.A., will lecture on "An Historical Sketch of Oxford." 1 p.m. : Conference luncheon in the Halls of Magdalen and Queen's College. 2.30 p.m. : Personally-conducted visits to University and College buildings. 5 p.m. : Town Hall. Official welcome on behalf of the Corporation. 5.45 p.m. : Lecture in Town Hall by Mr. Raymond Unwin on "Town Planning in a City like Oxford." 8.30–11 p.m. : Reception in the Hall and Gardens of Magdalen College at the invitation of the Berks, Bucks and Oxon Architectural Association.

FRIDAY, JULY 11.—9.45 a.m. to 6 p.m.—*Alternative Programmes* :—(*a*) A Tour by steamer from Salter's Boat House (Folly Bridge) to Abingdon, Dorchester. (*b*) A tour by motor coach, starting from Oxford at 9.30 a.m., and proceeding by way of Faringdon, Lechlade, Coleshill, Fairford, Burford. 7 p.m. for 7.30 p.m. : Conference banquet in the Hall of Christ Church.

SATURDAY, JULY 12.—Privately-arranged excursions and visits.

Dr. R. M. Walmsley.

We regret to announce the death of Dr. Robert Mullineux Walmsley, D.Sc., F.R.S.E., M.I.E.E., who died recently as the result of an accident. Dr. Walmsley was principal of the Northampton Polytechnic Institute, Clerkenwell, and chairman of Convocation of the University of London.

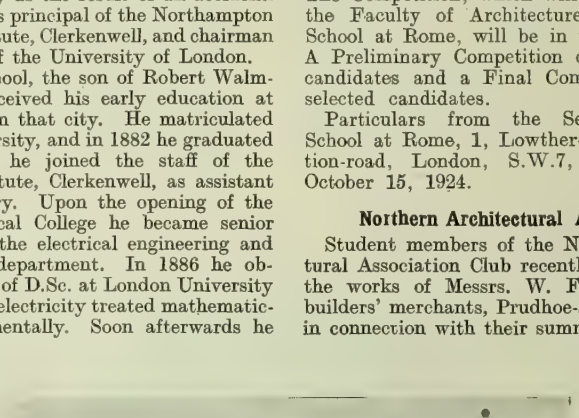
Born at Liverpool, the son of Robert Walmsley, jun., he received his early education at Queen's College in that city. He matriculated at London University, and in 1882 he graduated B.Sc. In 1881 he joined the staff of the Horological Institute, Clerkenwell, as assistant to Professor Perry. Upon the opening of the Finsbury Technical College he became senior demonstrator in the electrical engineering and applied physics department. In 1886 he obtained the degree of D.Sc. at London University on the subject of electricity treated mathematically and experimentally. Soon afterwards he went to India as principal of the Sind Arts College of the Bombay University. In 1888 he returned to England and was appointed senior mathematical lecturer and demonstrator at the City and Guilds (Engineering) College. In 1896 he was appointed principal of the Northampton Institute.

Rome Scholarship in Architecture.

The Rome Scholarship will be of the value of £250 per annum, and will be tenable at the British School at Rome for a maximum period of three years. Candidates must be British subjects and less than twenty-seven years of age on July 1, 1925. Admission to compete may be granted at the absolute discretion of the Faculty to candidates over twenty-seven years of age, provided they have spent in war service at least that number of years by which their age exceeds twenty-seven. The Jarvis Studentship will be of the value of £250 per annum, and will be ordinarily tenable at the British School at Rome for two years. This Studentship will be confined to Students or Associates of the R.I.B.A., but otherwise the conditions of the two awards will be the same. The Competition, which will be conducted by the Faculty of Architecture of the British School at Rome, will be in two stages, viz. : A Preliminary Competition open to approved candidates and a Final Competition open to selected candidates.

Particulars from the Secretary, British School at Rome, 1, Lowther-gardens, Exhibition-road, London, S.W.7, not later than October 15, 1924.

Northern Architectural Association.



Student members of the Northern Architectural Association Club recently paid a visit to the works of Messrs. W. Ferguson & Sons, builders' merchants, Prudhoe-street, Newcastle, in connection with their summer months series of tours of local works, and were shown a la variety of fibrous plaster casts for cornice, fri and ceiling decoration. The principal of firm, Mr. Ferguson, received the visitors.

Fireproof Floor Advantages.

The Directors of the Frederick Hotels, L state that owing to the fireproof floors and st cases used at the Hotel Majestic, Harrogate, serious damage was done by the recent fire.

The Bexhill Corporation invite designs fro architects in the district for the erection of entertainment hall. Premiums of £50 and £ are offered respectively. Sending-in da September 1.

The conditions of the Bexhill Town Ha Competition are not in accordance with t R.I.B.A. regulations, and members are advis not to take part until they have been revise

The Harrogate Infirmary.

The committee of Harrogate Infirmary invi designs for the extension of this Infirmar Mr. Sydney D. Kitson, F.R.I.B.A., has bee appointed assessor. Premiums of 150, 100, an 50 guineas will be awarded respectively Sending-in day September 30.

Masonic Memorial.

Designs for rebuilding Freemasons' Hal Great Queen-street, Kingsway. The com petition to be conducted in two stages. Eac of the architects submitting a design in th final competition will receive an honorariu of £500. Assessors, Sir Edwin Lutyens, M Walter Cave, Mr. A. Burnett Brown. On receip of one guinea competitors will receive cond tions of the competition, which has the ap proval of the R.I.B.A., together with bloc plan of site.

Applications marked "M. M. M. Competition must be received by The Grand Secretary Freemasons' Hall, Great Queen-street, Londo not later than August 23.

National Theatre.

The names of the winning architects in th recent competition for designs for a Nationa Theatre organised by the British Drama League are as follows :—(1) Mr. W. L. Somervill Toronto ; (2) Mr. W. J. H. Gregory, A.R.I.B.A London ; (3) Mr. W. J. Theodore Godwi Lancaster.

Other Competitions.

Other competitions still open include th following (the dates given are, first the sending in date, and second the issue of *The Builder* i which full particulars were given) :—Ross-Smit Memorial (Sept. 30 ; Feb. 21). Glasgow Publi Hall (July 4 ; May 2). Harrogate Infirmar (Sept. 30 ; May 30). Hamilton War Memoria (Sept. 1 ; May 30). Glasgow High Schoo Memorial (Sept. 30 ; June 13).

CORRESPONDENCE

Proposed Second Manchester Art Gallery Competition.

R,—Last year the Manchester City Council orised the Art Gallery Committee to devote 00 for a second art gallery competition on old infirmary site, although there is no ediate intention to erect the buildings as e are no funds available. The first com- ion for a joint art gallery and library on the e site was held some ten or eleven years ago, was very fully illustrated by *The Builder*. rly this year it was announced that three ssors had been appointed and the Lord or—clearly an optimist—stated that he d to lay the foundation-stone this June. y last March the local papers announced the Art Gallery Committee had entertained assessors at lunch, so the proposed competi- must be about due. An important point ests itself—it is a condition that the area to overed by any new building on the Piccadilly must not exceed that of the former infirmary. Corporation possesses an extremely large constantly growing collection of pictures; ously in a new building all should be dis- ed in top-lighted galleries, to erect a building side-lighted rooms would be a great mistake. here are no available statistics to show ther top-lighted galleries can be provided he limited site to display all the pictures ed by the Corporation and to provide space ddition for occasional loan exhibitions, also additions looking ahead two or three rations. It seems to be extremely improb- that within the area of the old infirmary sufficiently large number of top-lighted eries can be provided. Should that be so, ld it not be desirable to select a site in one ne parks, all of which are readily accessible the excellent municipal tramway service? y years hence extensions may be necessary; would be impossible on the Piccadilly site. y other towns have their art galleries in the rbs. A park site has the further advantage a stone-faced building would not become k in a few months.

minor point suggests itself: the tendency ecent competitions has been to reduce the k of competitors—thus for the drawings scale has become quite frequent. Former chester competitions have generally been to th scale (the technical school, chief fire ion, baths and schools); that involves a quite ecessary amount of work. What may be ed the brainwork can be readily conveyed the smaller scale and easily grasped by erienced assessors. In the Harrogate com- tion now pending the conditions state that perspective drawings will be accepted; ssors do not require them: and as regards public a perspective of the winning design be prepared after the award has been made. y should scores of competitors be put to the ible of preparing perspectives which no one look at?

the recent Hull competition there was an ellent clause: A double elephant sheet of e scale details was optional; competitors not mitting one will not be prejudiced. An itect capable of evolving a design of suffi- t merit to be placed first may be credited the ability of designing appropriate detail.

T. SINGTON.

Manchester.

The Wembley Palace of Arts.

IR,—In connection with the diagram of ections of the windows in Gallery "O" at mbley, published in your last week's issue, hould have noted that the reflecting surface ssumed to be vertical; if it is inclined, then reflections rise in proportion to the inclina- n of the picture. This and the similar galleries in respect of the reflection of the windows the side walls very satisfactory. The reflec- ns of the windows can only be seen on the tures on the end walls, and on the north and south walls of the large square rooms, "U" and "V." Here the reflections fall on the pictures at a height of between 8 and 9 ft. from the floor, and quite obliterate the upper portions of the beautiful full-length portraits. Reflections of the white cove fall between 6 to 7 ft. from the floor, as in the valuable Romney, where it envelops three of the heads and all the part above them in an annoying white haze.

S. HURST SEAGER.

[*** In the article by Mr. Hurst Seager in our last issue, p. 992, col. 3, par. 4, the word "practically" should have been "partially."]

York Minster Glass.

SIR,—I notice my name is referred to in the report of the annual meeting of the York Minster Window Fund in your issue of June 13. The Dean of York is reported as having taken exception to a remark made in an address I gave recently to the British Society of Master Glass-painters (reported in your issue of June 6) to the effect that the glass in the Minster is in such an extreme condition of decay that its repair demands the most careful technical supervision.

I cannot trace the particular report of my remarks referred to, but it is true that after the meeting I was closely questioned as to whether I considered the method of treatment practised unduly drastic, and I replied in the affirmative. I can only say that this is my honest and sincere conviction, derived from actual inspection of the work, and dictated by over thirty years' practical experience of the technical side of stained glass work. I expressed that opinion clearly to the Dean personally when invited to give my opinion some time ago; I have seen no indication that the methods have been changed since, nor is any statement to that effect made in the report.

It is stated in this report that the Dean will be only too happy to listen to anything I have to say in the way of advice on the subject. It is certainly due to Dr. Foxley Norris, who is faced with such a tremendous responsibility in the preservation of these windows, and whose zeal in carrying out that national duty commands universal respect, to reply to his request frankly; therefore I offer the following advice:—

1. Prohibit absolutely the practice of "cementing," which is ruinous to such fragile glass, and insist on the process of "puttying" being used exclusively.

2. Investigate fully the possibility of abolishing the prolonged soaking of the glass, which tends to accelerate its decomposition.

3. There are so many considerations involved in the proper treatment of the glass that it is desirable to have the constant advice of a trained master glass-painter, who has devoted his life to the craft and studied it from the artistic, historical and technical points of view.

NOEL HEATON.

Registration.

SIR,—While allowing all that can be justly claimed in favour of Registration, and quite apart from the consideration whether the aim is practical politics, seeing the chances are so remote of its finding acceptance in legislation to-day, we are bound to give attention to the very deeply-felt objections urged by many artists, as the matter is one which much affects the national life quite outside professional considerations. Professor Beresford Pite's letter in *The Times*, in which he stated some objections to the proposal, since followed by another from Mr. F. R. Hiorns, argues these objections with considerable force. As stated by him, "all great art has been evolved through the personal freedom of the artist to practise his art and express himself in his own way, untrammelled by restrictions other than those imposed by the right pursuit of his craft." Anything which imperils the freedom of art, which tends to make it "tongue-tied" by authority, which sets the test of examination above intuition, forcing it down those channels only which are approved by such authority, is in danger of promoting the average at the cost of the more greatly-endowed individual. As the adage tells us, "the good is often the enemy of the best," is impatient of that which cannot conform with accepted standards, and is even in danger of hating what it cannot understand. Organisation—which so many of us are feeling to be on its trial to-day—is always a danger to the arts because it moves only in the known—seeks security; and there is no security for creative art save its own. Constructing from what it understands, it makes experience the only test, and would depress to its own level the new experience of the creative mind.

Mr. Hiorns, in his letter, refers to the number of great architects who were the result, not of examination tests, but of their own noble selves, and this is no less true of the plastic arts. Those English painters most included in our national collections are seldom those whom authority endorsed at the time, and should we by registration make the path of genius harder—always rather at a discount in this world, unless we believe architecture to be a profession and not an art—we should be sacrificing the greater for the less, because there is more importance to the national life in having one Christopher Wren than in a thousand architecturally-trained in the sense we recognise to-day. This is said with no thought of disrespect for the average, but, on the contrary, in the assurance that the best security for its own freedom is the freedom it retains for its own best self, represented in this case by the man of creative endowment.

"ISIS."

Mr. Wheatley and the Building Industry.

SIR,—If you will further grant me the hospitality of your columns I wish in what I say to dissociate myself from the advocacy of all political policies.

It is clear that additional wealth (goods) can be obtained only by work wisely directed to its creation. If the available energies of the whole people were so engaged our real wealth would increase at the rate of, perhaps, £300,000,000 a year, and part of that could be spent on housing. Money is not wealth, for it is created at but the cost of paper and printing. It is merely a measure of value and a medium of exchange. Too little of it makes for low prices up to the time that production (being unprofitable) is curtailed, when the scarcity of goods reacts to raise prices.

Thus scarcity of money produces poverty, and abundance produces real wealth through full employment. The problem hitherto unsolved (if isometry be not a solution) is the frequent adjustment of the quantity of money to the requirements of trade, thereby maintaining a steady general price level and tending towards the abolition of booms and slumps.

The Government can have their houses if they set up plants (to produce the materials), such as virgin brickworks, and pay with legal tender paper—no usury. Prices will certainly rise, but against that may be set not only the houses, but some of the cost, moral and material, of supporting the unemployed.

The repayment of part of the National Debt with legal tender paper is necessary to the success of the scheme.

The Proposed Reform of the London Building Law.

ON June 23 Mr. C. A. Daubney, F.R.I.B.A., lectured on "The Proposed Reform of the London Building Law," at 9, Conduit-street. Mr. J. A. Gotch, President, presided.

In July, 1922, the Council set up the London Building Acts Committee, with Mr. Daubney as Hon. Secretary. The Committee presented a Report to the Council in April last and the Council gave it careful attention at three meetings. As a result certain modifications inserted by the Council were unanimously approved by the Committee and were included in the final report, which is in the form approved by the Council.

The Council invited Mr. Daubney to read a paper on the subject from which we give the following extracts :—

It was no surprise that the committee found no general body of opinion in favour of any radical departure from the present system. That the law needed a measure of reform was another matter, seeing the main building act was passed as long ago as 1894, since which time important advances had been made on many subjects included in the building law. The committee also noted the various legal enactments, such as the Factory Acts, which were akin to building regulations, and they felt that there was a real necessity for codification. Procedure should also be uniform as far as possible.

Before considering the report two points must be made. They would apply substantially to all the items in the report. First : The conclusions of the committee were only in general terms. Before they appeared in an Act of Parliament they needed to be put in legal form. There must also be safeguards and many consequential amendments and alterations. Legal advice on the subject might have to be obtained. The second point of explanation was that the report had not been prepared in ignorance of the fact that the London County Council had very wide powers of varying the ordinary requirements of the Building Law, and that in many cases dissatisfied applicants had a right of appeal. The report, however, was framed in the belief that it was advantageous and helpful to the public for legislation to be more positive than negative. For instance, it was of real value if an architect in advising the development of an estate could assure a prospective power what he could do rather than what he might perhaps persuade the London County Council to permit him to do. In practice it was often highly inconvenient, in fact most undesirable, or even impossible, to make an application and by trial and error discover what might be done. The London County Council was not in the habit—rightly so—of giving an approval without all the facts of locality and other details of a like character being divulged. The consequence was that a preliminary plan might be so speculative as to be of little value, and otherwise hopeful schemes might come to nought. The report, therefore, indicated the desirability of amending the law in such and other similar directions.

The present Building Act did not give the power of developing a small site by laying down a road out of a street and to curve it back a short distance off. The law demanded that such a street should join up another street, and there must be no gates or arches at either end. In these days of frantic hustle on the public highways, with the accompanying noise, stench and clouds of dust, it would be a real advantage to live apart from the madding crowd, or where the traffic on the highway would not be tempted to overflow. It was possible once to lay out such quiet places. The report reminded them that Burlington House courtyard might not be duplicated in Piccadilly or elsewhere in London. It was a cul de sac, and because the Royal Academy building was more than 60 ft. from the entrance archway the Building Law now frowned severely upon it. The Crown Surveyor found a quiet refuge within a stone's throw of Trafalgar-square side of the cul de sac end of Suffolk-street. Culs de sac such as this could now be objected to. Attention was directed to the fact that there was no authority given by law for a frontage line to be fixed before buildings were commenced in a street. The first builder might form a yard between his buildings and the street. This curious result followed. All other subsequent buildings on either side of him must also have yards at least equal in depth quite apart from whether they desired them or not. The report ventured the suggestion that this needed amendment. The time had also come when the building line should be indicated for all existing street frontages, and if this work were undertaken systematically by existing machinery ten years ought to see it accomplished. It would perhaps be agreed that the width of a new street and the building line for houses on either side should be taken together. The report considered this of importance. Reference was made also to the necessity of a reform in the law governing building over sewers. Since the report was prepared, the London County Council had reported that they were recently before the House of Commons Committee on the subject, when that Committee proposed that the London County Council's power of full discretion to grant or withhold consent should be curtailed in several directions. It would be seen, therefore, that this Institute was not taking an unreasonable attitude in suggesting revision of the law on the same lines.

Part II of the Report dealt with height of buildings. This thorny question had not been burked. The argument had been used that the law with regard to the height of buildings should remain as at present, in effect that London should exhaust all its present powers to build to 80 ft., and then, and not till then, seek amendment in the law. Here the report confidently made a stand. It was strongly opposed to permitting in the West End and other parts of London every narrow street to become a tunnel and its multitude of rooms to become caverns where artificial light must be regularly used. It was not proposed to remove the general limiting height of 80 ft., but it did not go so far as to declare that under no circumstances whatever higher buildings might not be erected. At the present time, Government buildings, churches and chapels, buildings any where in London belonging to the Inns of Court, and things which perhaps by a stretch of imagination might be deemed ornamental features or towers, could scrape the sky with impunity, and new schools might do the same. When details had to be thrashed out it might be found desirable to require that all buildings should follow at least the ordinary rules as regarded height. The decision as to higher buildings was still left with the London County Council with an appeal. Of course, constructionally high buildings which were easily built on, say, the swampy lake foreshore of Chicago, could be built, say, in the middle of Holland Park, and in many other places in London, and no material injury would be done to anyone. The great difficulty, however, which it was believed confronted the London County Council in their deliberations on applications for higher buildings was that a refusal, possibly on the ground that the architecture did not please the Building Act Committee of the London County Council, or even that they had passed a resolution to allow no more higher buildings in London, might not be sufficient ground for refusal. Without necessarily accepting that view, it must be agreed that high buildings involved very many questions—good taste and wide views were involved. There might be no intrinsic objection to a single high building, say, in the middle of the facade of Carlton-terrace. But if that one building be erected, why not all the facade to an equal height ? The London County Council should not be tethered in its judgment, but should secure opinion of the highest standing and of the most independent character, and the Report suggested that the opinion of the Fine Arts Commission should be invited. The report also suggested a mo tion of the stringent requirements in Secti of the London Building Act, 1894, which vided that whenever a greater height tha prescribed by the Act was contemplated owner or lessee within 100 yds. might ha be consulted. This did not apply only i case of high buildings. Lay out a passage wide, and if you tried to build 21 ft. high body within 100 yds. had to be consu Crowded business areas as well as sca suburban areas bore the same burden. amendment of this part of the law was necessary.

A proposal was also made in the repo which London, through the London C Council, should have power from time to as experience indicated, to amend the structional clauses set out in Part IV of the Act. At the present time this could not be except by Parliamentary sanction. It surely one of those domestic matters that Lo should control, and not have to go cap-in-to Westminster, or even to appeals at Whit

Another suggestion was made by whic London County Council could be relieve much routine work. It seemed unnece for the staff of the London County Coun investigate every joint and member of, a small rain screen against the yard wall huge steel-framed warehouse. In such a i ing every detail of the construction had t passed by the district surveyor. He had c of the drawings, and surely he could be tr to see that a trifling thing as this was well truly built.

With regard to signs, regulations were d up by the London County Council years The machinery had proved faulty, other there would be no necessity now to sug amendment.

Dealing with the questions of fire protec and means of escape, Mr. Daubney said the London County Council had certified means of escape the document would per be filed away with the architects' papers o of knowledge in his client's safe. It was gested that the particulars should be on premises. The Report did not wish in any to raise alarm, but the question often aro when a place of assembly was fully occupie the public, was everything well ? Wit hesitation it was confidently asserted that there were such vast interests involved, ma personal, but also material, in theatres an other places of public assembly, no stone sh be unturned until the architect had hin indisputable evidence that his plans could well be challenged in the event of an acciden

A piece of very cumbrous machinery w nullified to a large extent the chief purpose which the 1905 Act was passed—viz., tha providing means of escape for old dange buildings was also dealt with. Another sec of the Report dealt with exempted build which were entirely outside the pale of the as regarded construction. The Report m the suggestion that the district surveyor the best person to determine on the spot whe a proposed form of construction was suitabl

Referring briefly to the administration by district surveyor, the following informa should be given : During all the war pe and when building operations were seve restricted the district surveyors, whose inco were limited entirely by the amount of w done in their respective districts, suffe heavily ; besides, they had to bear the wh of the expenses for their office and had retiring allowance in prospect. Some were able to pay even their office expenses out the fees received from their district. In 1 thirteen districts did not produce a net inco of £2 per week. In consequence of this hea burden of loss the fees were raised in 1921 five years. This had produced a net incre above pre-war figures of about 25 per ce The Report recommended that the fees sho be graduated more fairly, and the work whi carried a higher service should receive a high fee than the work which required less.

The discussion on this paper was adjourn until Monday next.

Mortuary Chapel. By IVAN MESTROVIC.

(*See page* 1018.)

A MORTUARY CHAPEL BY IVAN MESTROVIC

By KINETON PARKES

In the summer of 1915 a new power in plastic art was revealed at the Victoria and Albert Museum by the exhibition of the work of the Yugoslav sculptor Ivan Mestrovic. Further than that, there was a wooden model of the Temple of Kosovo which proved Mestrovic to be an imaginative and original architect. The Temple was a pious aspiration towards the creation of a grand Serbian national memorial, and has not at present been realised. The artist has not been idle, however, and has proved on a smaller scale what he foreshadowed in his Temple. He has made a beautiful and original mortuary chapel in Dalmatia, where he was born in 1883.

At Cavtat, near Ragusa, the exquisitely situated small city on a tongue of land pushing out into the Adriatic from the coast, dominated by Monte Sergio, the new chapel takes its place beside fine monuments of Byzantine art; Franciscan and Dominican convents of the fourteenth century; the fountain and aqueduct of Onofrio, the fifteenth-century architect; a palace which is a combination of late Romanesque and Venetian Gothic, and a cathedral of the eighteenth century. It stands at the end of the tiny peninsula and faces the mountains. It is erected to the memory of the Racic family and includes sculptured portraits of the father, mother, son and daughter. The latter originated the idea and the mother, who died last, commissioned, in her will, Mestrovic to carry it out, which he did during the years 1920-22.

Figure at the Side of the Porch.

The building is of local stone, Bracca, and Dalmatian marbles, and the sculpture is of the same stone and bronze. It is 16 metres by 14 metres, and 9½ high, octagonal, including four compartments, thus securing a cruciform plan which includes the porch, the altar and north and south chapels; a cupola roof embodies a lantern bearing an angel in bronze, and within the beautiful bell is sculptured with bas-reliefs of saints and a Pietà; the inner roof of the cupola is decorated by many small angel heads set in the alternating cubes of stone of which it is built. Beneath are the crypts, marked by symbolic statues on the walls and bearing the names of the commemorated. The marble floor is tessellated, and represents the symbols of the evangelists and the signs of the planets.

The exterior presents an almost plain mass of cubes of stone broken by the porch, which includes two elongated caryatids of angels with folded hands, supporting a plain architrave and a pediment with a carved moulding. Another decorated moulding with a sheep motive forms the base of the cupola, which itself consists of plain oblong slabs of stone overlapping like shingles, and this is surmounted by the arcaded lantern with the angel in cruciform.

Five steps in the porch lead to the large bronze double doors, with four figures of Slav saints in low relief, with the symbolical snake beneath the feet of the two lower. Around this double panel is a border with medallions, contained in a continuous spiral, of various other saints and the signs of the zodiac.

The interior is illuminated only from the cupola and six small windows at the sides; the natural light is but dim, and the altar, recessed in the western elongation of the chapel, is lighted by four large candles in spiral candlesticks on consoles. The front of the altar consists of a large low relief of the Descent from the Cross. On each side the walls above are occupied by reliefs of three male nude figures playing on musical instruments. The Mother and Child group is mounted on a cubic base decorated with a relief of the winged Lamb of God, and the head of the Mother reaches to the roof, which is carved in small panels of angels' heads in perspective and billing doves.

The two chapels are only slightly illuminated by small slit windows, and one of them is the Chapel of the Crucifixion, the back wall of which bears the gaunt Christ, flanked by large candelabra on brackets carved with angel-heads. On the side walls are two reliefs, and the design is repeated in the opposite chapel of St. Rochus, a tall figure with water-bottle and staff, and at his feet a seated hound licking his leg in devotion.

The whole work is a harmony of design. It is symbolic in its conception, for its materials are those of the land in which it is built; its construction is the outcome of its author's passionate nationality; the type-figures of its plastic aspect are those of the southern Slav, seen in other sculptors of the country as well as in Mestrovic. It is a chapel of death, but it is a chamber in which the continuity of life and the eternity of religion are welded into a single proposition. It has its spiritual significance, for although it is not a great monument such as a Gothic cathedral, seeing that it is the work of a single artist, it is an indication that the flame of art is still burning; the force of original creation still actively at work in man for the production of original form. It is, moreover, one of the finest of

The Bronze Double Doors.

the few testimonials to the desirability of the union of sculpture with architecture that has been furnished in modern times. The chapel is an example of unity of conception and execution such as is rarely met with.

EXHIBITION NOTES

GUILD OF POTTERS.

For a first display the exhibition of the Guild of Potters at the Grieves Gallery must be accounted a distinct success. The members seem to be all actuated by a high standard and some delightful specimens of pottery are the result. A certain impressive and monumental character is evident in many of the animal subjects, and all the vases and bowls have a definite good quality of form and colour. The quality of technique is remarkably good, and we believe if the subject matter of the figure pieces were more generally attractive there would be a large demand for such excellent productions. The figure of Dolores, by Mrs. C. Gregory, the tug-of-war, by C. Vyse (17), and the equestrian statuette by S. Thorogood may be named as indicative of the distinction which goes with many of the pieces. Though the prices do not seem high for such good work, we can only hope that somehow this admirable style of design and craftsmanship may push its way with cheaper and simpler production.

OLD MASTERS.

The loan exhibition of old masters at Agnew's in aid of Lord Haig's Appeal for ex-Servicemen shows us some characteristic work of the highest quality. The portraits include some of the finest things ever done, such as the wonderful head by Giorgione (17), and the 14, 11, and 23 by Van Dyck, Hals, and Rembrandt. The exquisite landscape, "Summit of Cader Idris" (20), by Rich-Wilson, shows what fine observatory powers of nature was behind Wilson's classical landscapes.

TWENTY-ONE GALLERY

Some freshness and truth of observation appeared to us to make notable the work of Miss E. Stewart Wood in her pictures of Spain at the Twenty-one Gallery. Some of them are excellent pictures of light and colour, as Nos. 14, 10, and 3.

West China University.

An article on the West China Union University at Chengtsu is given on p. 1024. Messrs. Fred Rowntree, F.R.I.B.A., & Sons, are the architects.

Miners' Welfare Centre Competition.

The first premiated design in the competition for a Miners' Welfare Centre at Brancepeth, by Messrs. Hays & Gray, AA.R.I.B.A., is illustrated this week. Some notes on the design are given on p. 1029.

West Park Mental Hospital, Epsom.

West Park Mental Hospital is designed on the villa principle, every building for patients being detached. It has four sections :—

(1) The admission hospital and villas for convalescent patients. (2) The main hospital, the buildings of which are connected by open-sided covered ways. (3) The special hospitals for the treatment of tuberculosis, dysentery and other infectious diseases. (4) The "open" villas for patients suitable for parole, and patients engaged in domestic duties and on the farm and gardens.

The estimate for the buildings, engineering works and equipment of the complete hospital approved by the Council in 1912 was £517,970. The estimated cost now, owing to the losses caused by the 4½ years' suspension, limitations, delays, increases in wages and in cost of materials that have since occurred, amounts of £1,030,670.

The total area of the West Park Estate is 230 acres, and of this the buildings, grounds, recreation field and kitchen garden occupy 83½ acres. The wards and buildings with their gardens cover 44 acres. The floor areas of the buildings amount to 9 acres.

Messrs. Leslie & Co., Ltd., were the general contractors. Heating and hot water, Messrs. The Brightside Foundry & Engineering Co.; electric cables, Messrs. Cox, Walker & Co.; electric wiring, Messrs. Higgs & Hill; kitchen plant, Messrs. Moorwood; bakery plant, Messrs. Mason.

The design of the buildings and of the engineering work were prepared by Mr. Clifford Smith, O.B.E., F.R.I.B.A., the Mental Hospital's engineer, with whom is associated Mr. Leolin C. Gregory, A.R.I.B.A.

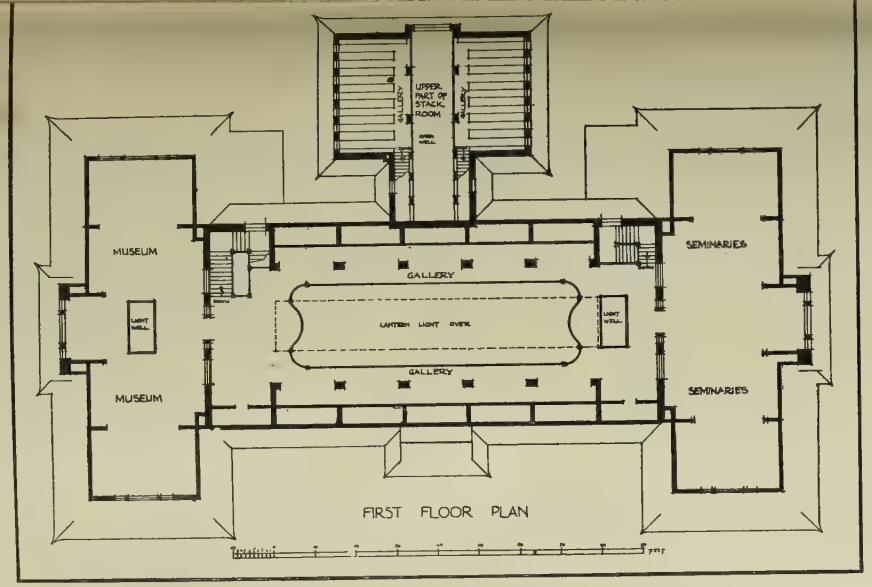
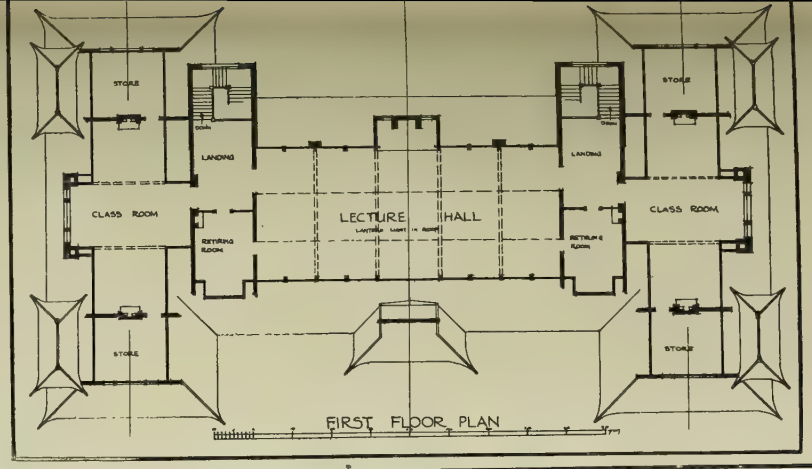
THE SOCIETY FOR THE PROTECTION OF ANCIENT BUILDINGS

AT the annual meeting of the Society for the Protection of Ancient Buildings, on June 24, held, by permission of the Royal Institute of British Architects, at 9, Conduit-street, Professor W. Rothenstein lectured on "The Human Element in Building." Lord Howard de Walden presided.

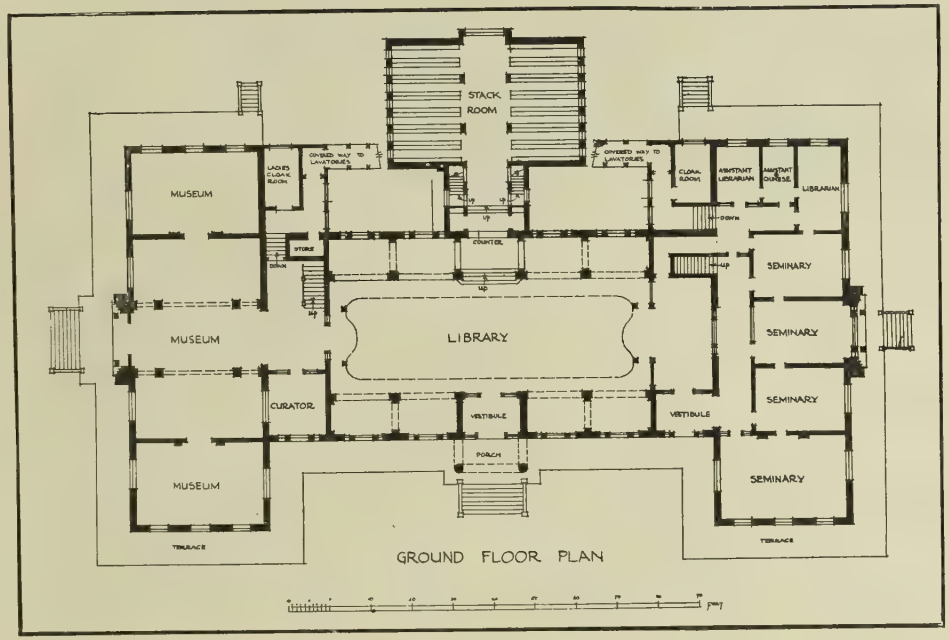
The report of the Society stated that during the past 47 years the society had achieved much, but much remained to be done. There was the destruction of the Old Court House at Barking and of the Star Inn at Bury St. Edmunds. There were also the efforts to do away with the Whitgift Hospital at Croydon, and the fate of the City churches still remained in the balance.



In moving the adoption of the report, Mr. A. R. Powys (secretary) said the society was particularly interested at the moment in the threatened destruction of some of the City churches and in the question of Waterloo Bridge. With regard to the City churches, it was not generally known that the National Assembly of the Church of England was about to consider the advisability of destroying a certain number of the churches at a meeting to be held next Monday. It was the duty of their society to do everything in its power to prevent the destruction of any of the City churches. As to Waterloo Bridge, the society had caused a report to be prepared on its condition by an eminent engineer, and this was being considered by the L.C.C. The report expressed the view that it was possible to maintain the existing bridge without demolition by repairing the damaged parts. The Minister of Transport had issued advice to various authorities that, if possible, new bridges should be of ferro-concrete or steel. They could imagine the effect of such advice.

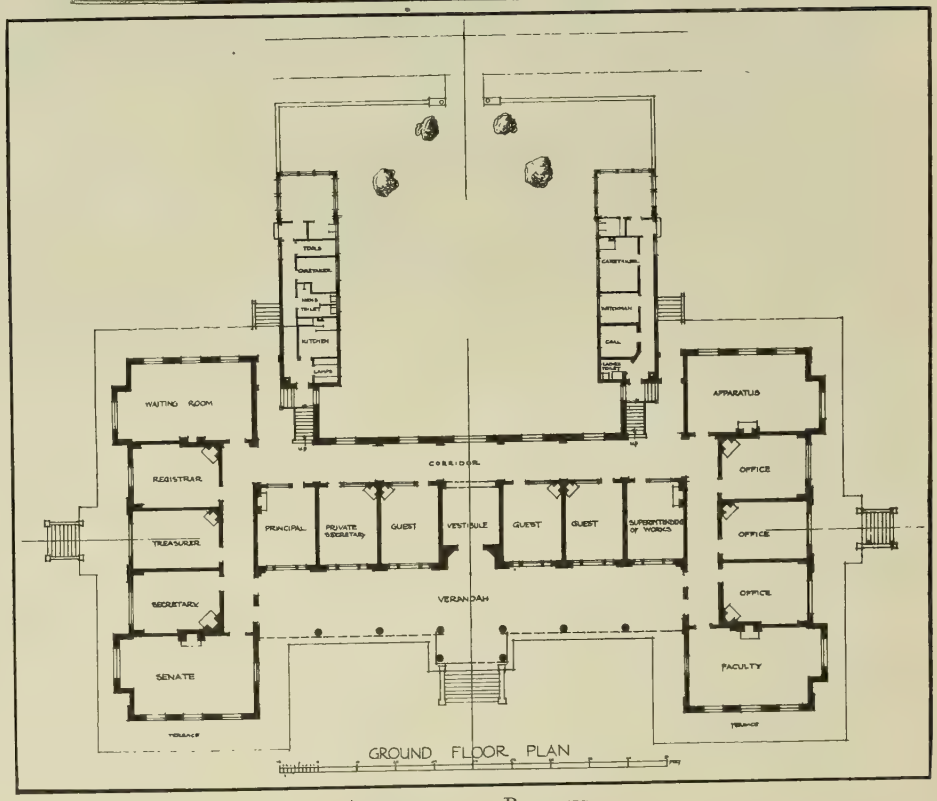


Mr. Thackeray Turner said that if the L.C.C. widened the bridge the beauty would be lost. There was no doubt that the question of bridges over the Thames would have to be considered, and that there must be a road bridge at Charing Cross sooner or later. Why not get on with it now and leave Waterloo Bridge alone except for the necessary repairs?



Professor Rothenstein in the course of his remarks said one of the ironies in their position was that people did not wish to destroy; they had the most acquisitive state of society ever known. Look at the looting which went on to supply the museums; and the numerous quantity of pictures acquired which would fail to be of interest to the next generation. Yet they seemed incapable of keeping their national history alive by the preservation of things which, in most cases, could be used as well old as new. Another irony of life was that they were unable to make use of the dynamic forces of the nation; they were in a state of muddle. Style was an intrinsic crystallisation; each age had its own idea of the truth. With regard to men like William Morris, who founded the Society, the mistake was made of believing that a noble style was always noble, and a trivial one always trivial. Each age expressed its own idea of style. If they did not sympathise with the seventeenth and eighteenth century as much as the fourteenth, let them think: Did the seventeenth and eighteenth centuries express the attitude to life of the builder. If so it was good architecture. In front of the builder and architect was always the question of national tradition. The word tradition was very much misused. The danger for all artists was that the public believed that a thing which looked like a good thing was a good thing. Although men might live at Oxford and Cambridge he had never seen that living among beautiful things enabled them to appreciate the beauty of their own days.

With regard to the politicians' attitude to art, Professor Rothenstein suggested they should get a promise from them in the same way as a Manchester manufacturer got a promise in regard to, say, protection. He considered they should try a militant system.



After a vote of thanks had been given to Professor Rothenstein, Lord Walden said one of the greatest pleasures in his life was to inhabit one of the oldest houses in the British Isles. With regard to tradition, he felt it was a little overlooked that everyone when speaking of tradition assumed one was speaking of those who followed tradition; he thought tradition was just as valuable for promoting re-action. With regard to legislators and art, he thought the present Government more amenable, and took more interest in these matters, than any previous one. Thanking the Royal Institute of British Architects for the loan of their room, Lord Walden said someone once remarked he wished a moderate knowledge of architecture could be made a part of the curriculum of education. It was not, on the whole, surprising there was not a sufficient outcry against modern atrocities; the public had not been taught.

WEST CHINA UNION UNIVERSITY

THE city of Chengtu has been laughingly described as the hub of the universe. On investigation the jest is found to contain a surprising amount of truth. This city of half-a-million people, seventeen hundred miles by river from the mouth of the great Yangtze-kiang, and within sight of the foothills of Tibet, is capital of the province of Szechwan (larger in area than France), and at the heart of one of the most densely populated regions of this earth. More than half the population of the world is estimated to live within a circle drawn with Chengtu as its centre and a radius of 2,000 miles. One half of these, the Chinese, are one of the oldest nations in the world, and among its most highly cultured peoples. The others include most of the chief racial stocks, stocks that down through history have been in continual strife. The problems of the Pacific hold far greater dangers for the world than the national and racial animosities of Europe. Napoleon was right in saying that when China awoke she would move the world. And there is no gainsaying the fact that China is awakening.

Chengtu is one of the chief centres of government in China and a place of influence in its educational life. It is clear, therefore, that by its position it is pre-eminently fitted to be a university city. Fifteen years ago the Protestant missions in West China united in their educational work and resolved to found a university. Land was bought just outside the south gate of Chengtu, and during one Christmas vacation three boys' middle schools, founded by separate missions and situated in different parts of the city, were hurriedly moved into emergency quarters on the university grounds. Thus began the University Middle School which now has its own permanent buildings on a site separate from but adjoining the university grounds. The next year the University opened, also in emergency quarters, with a class of ten students. The work thus begun in a small way grew rapidly, and now, while the university is not yet in its fifteenth year, the staff numbers sixty-one and the students 146. In addition to these are the students of the middle school, numbering some 300, and when summer-course students are counted the total exceeds 600.

ENTRANCE GATES TO ADMINISTRATION BUILDING.

West China Union University: Lay-out Plan.

The regular courses laid down by the Chinese Government were followed, and the faculties of arts and science were the first to be organised. But the need for fully trained teachers, preachers and doctors was so great that the faculties of education, religion and medicine were soon added. More recently a department of dentistry has been opened in addition to the more normal medical work.

The organisation of the university follows the general scheme of Oxford and Cambridge. The students live in various colleges, one having been contributed by each of the co-operating missions. These colleges and the residences for the faculty occupy the outlying parts of the grounds; in the centre are grouped the university buildings for teaching and administration. Control is vested primarily in the Senate, but ultimately in a Board of Governors, the members of which are at present resident in Great Britain and America. The chairman of the Board is Sir Joseph Flavelle, well known in connection with Toronto University; and the vice-chairmen are Sir M. E. Sadler, Master of University College, Oxford, and the Rev. F. M. North, secretary of the American Methodist Episcopal Mission. The Senate is at present largely made up of foreign missionaries from America and Great Britain,

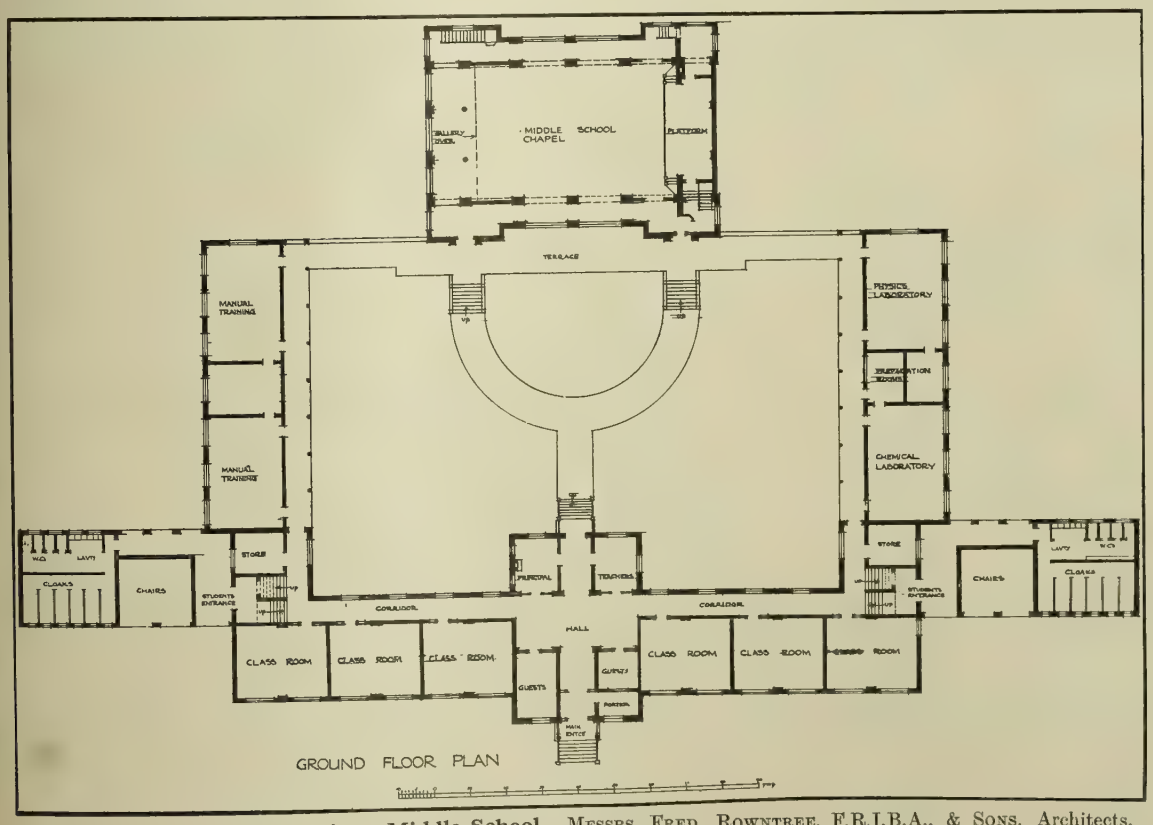
there are already a few Chinese
bers, and it is intended that
proportion of these shall steadily
ease.

ow far is the University a univer-
merely in name? Until the
ent year its degrees and diplomas
been issued solely on its own
ority and without government
ther charter. But from the first
question of standard has been
to the fore, and as a result, the
ents of the University have been
n gratifyingly high standing
n they have gone abroad for fur-
study. And now an educational
d in America which makes a
ial point of watching the
dards of universities and colleges
ne East and giving them recogni-
where it is deserved—the Board
egents of the State of New York
s granted a provisional charter
ne West China Union University
has thus set a hall-mark upon
cademic standards.

ne University is unique in the
in which it co-operates with the
ese. This is now admitted to
a sound principle for Christian
ational work, but even in earlier
the University followed the
ernment curriculum and was in
dly co-operation with the
ernment schools. The number
hinese on the faculty has grown
ily, and while, of course, it
s time to find or to train men of
cient knowledge and capacity and
ing power to serve on the staff
university, eleven such are
dy appointed.

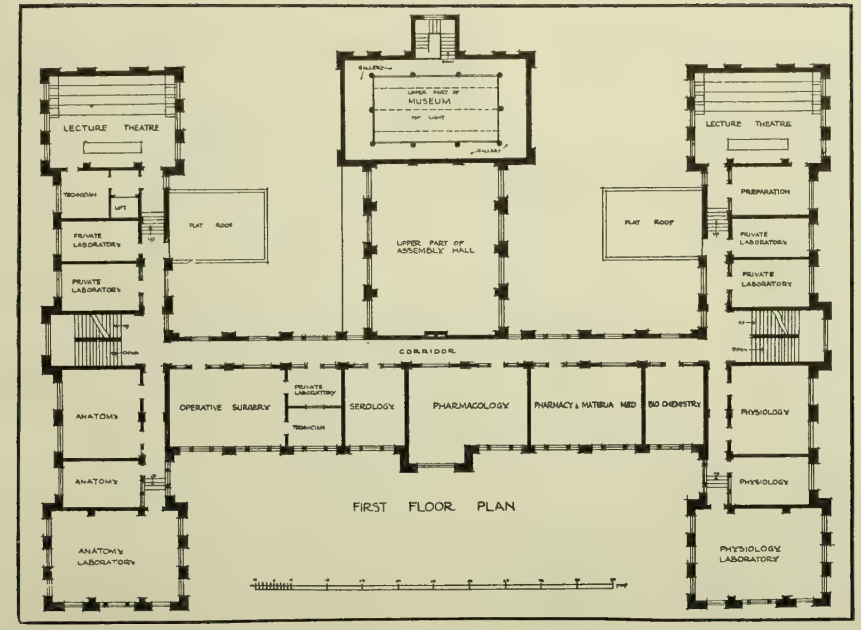
om the foundation of the
ersity it has always been hoped
its influence would result in converts
Christianity, and its success in this
tion has been great and gratifying.
the transformation which it has pro-
d in public sentiment may outweigh
ignificance the enrolment of members
he Christian Church. It would be
to overestimate the value of the Univer-
s influence in spreading ideals of inter-national good will and peace. Not long ago one of the Chinese daily papers invited its readers to select by vote the twenty-four men who might be considered as the leaders of China. It is extremely significant that about half of those selected were Christians, and even more had received their education in Christian universities similar to the West China Union University.

Main Corridor in Administration Building.

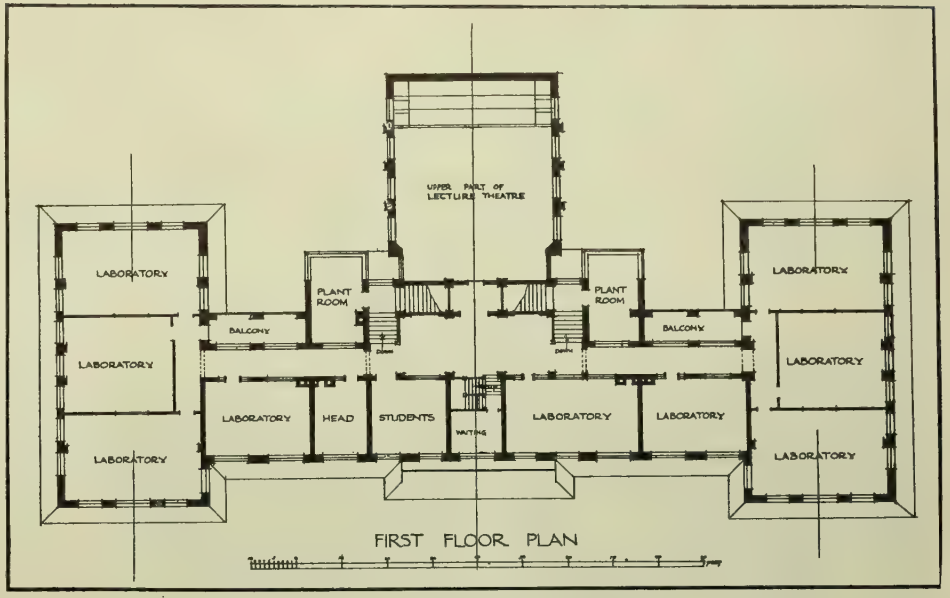


University Buildings.

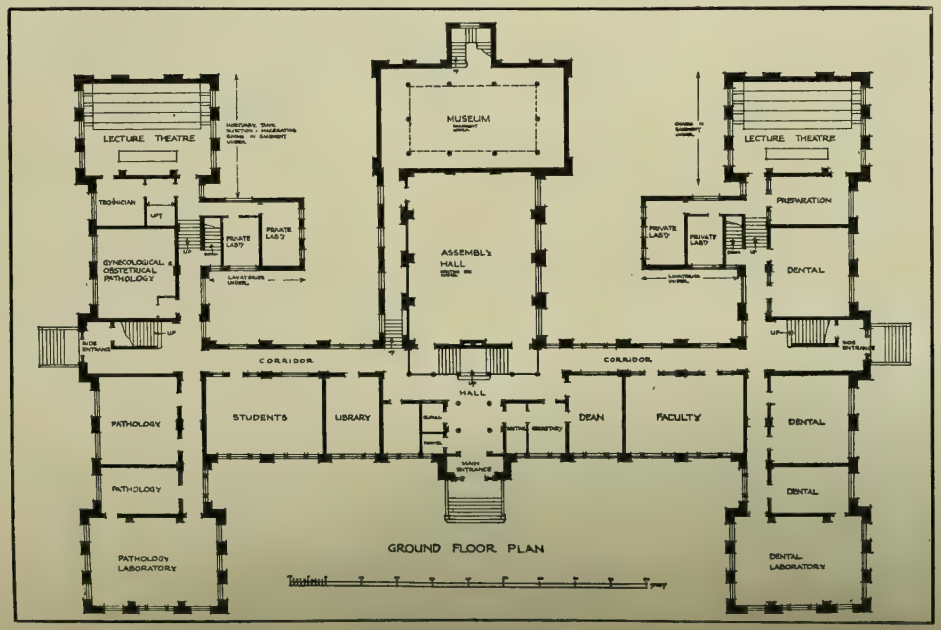
The Board of Governors, with a view to the appointment of an architect, invited one American, one Canadian, and two English firms to submit plans. On the advice of their assessor they selected those prepared by Messrs. Fred Rowntree & Sons, of London, who received the appointment of architects to the University.



Before commencing building operations, the senior partner visited the site and discussed the various problems, not only with the members of the Senate, but also with the three leading Chinese statesmen of the Province, who welcomed the suggestion that the design of the buildings should be Chinese in character, politely adding that if they were carried out in that spirit they could copy them! An endeavour has been made to maintain the forms, texture and colouring handed down from past history, and to adapt these to modern requirements, with the judicious and harmonious use of such materials and forms of construction as the country can best supply.



It is hoped that eventually a school of architecture may be founded in connection with the University.



The Campus occupies about 150 acres of land outside the ancient city walls, from which it is separated by the river, which skirts its southern boundary. The main entrance gateway is placed on the north and south axis of the central plot, at the point where the approach roads from the east and south city gates meet. The disposition of the five important buildings on this plot and their relation to each other have been considered with a view to obtaining not only a harmonious and well-balanced scheme of grouping on the plot itself, but also in relation to the surrounding plots and buildings of the associated missionary societies. The pride of place is given to the Assembly Hall, octagonal in form, with equally balanced façades. It is intended to be the dominating building, symbolic of the highest

purposes of the University. The Administration building is already completed, the Library building is in course of erection, and the plans for the Normal School are approved. The group of Science buildings are to flank the main avenue to the south of the Assembly Hall, terminating with the University Chapel. The Biology building is already in occupation. The site for the Medical College lies to the east, and the building will commence at an early date. The President's official residence and various professors' houses occupy surrounding sites in close proximity to the college buildings and the University Middle School and chapel, with accommodation for 300 students have been erected on a site adjoining buildings; and the University Middle School already completed and in immediate contemplation have been gifted by private donors, and it is hoped that funds for the remainder will be provided in a similar way.

Messrs. Fred Rowntree, F.R.I.B.A., & Sons are the architects.

ARCHITECTURE AT KENYA

We give below further notes on the architectural activities of Kenya Colony and the Uganda Protectorate.

Nairobi.

A competition for designs for the Native War Memorial has been held and the design of Mr. C. M. Giles, of Nairobi, has been adopted on the advice of the assessor, Mr. W. Dunn, F.R.I.B.A.

The Town-Planning Scheme for the civic centre of Nairobi, prepared by Councillor Harold E. Henderson, F.R.I.B.A. (Mayor of Nairobi) in 1917 and approved by the Kenya Government, will shortly become an established fact, as the Nairobi Municipal Council has settled that their offices will be erected in the New City-square; and they intend holding a competition shortly for designs for their proposed Municipal Buildings, limited to the qualified architects practising in Kenya Colony.

St. Andrew's Mission Church, Nairobi, is nearing completion from the designs of Messrs. Hurle-Bath, A.R.I.B.A., & Cobb. Considerable extensions have just been completed to the Standard Bank of South Africa, Ltd., Nairobi, the contractors being Messrs. G. Blowers & Co., from the designs, and under the supervision of, the bank's architects, namely, Messrs. Harold E. Henderson, F.R.I.B.A., & Partners.

Uganda.

The new banking premises at Kampala for the Standard Bank of South Africa, Ltd., have just been completed from the designs of Messrs. Harold E. Henderson & Partners. Erected in a style reminiscent of the seventeenth-century work in Spain, with white walls and large overhanging eaves, green painted shutters and ornamented iron grilles, it forms an architectural composition peculiarly appropriate to the climatic conditions of Central Africa.

Mombassa.

Designs have been prepared for large dock offices in connection with the Mbaraki dock scheme for Major E. S. Grogan, D.S.O., by Mr. Herbert Baker, F.R.I.B.A., of London and Delhi, in collaboration with Messrs. Harold E. Henderson, F.R.I.B.A., and Partners, of Nairobi.

The Resident of Zanzibar, Mr. J. H. Sinclair, C.M.G., C.B.E. has just retired. Mr. Sinclair was a pupil of the late Mr. J. L. Pearson (the architect of Truro Cathedral), and although he left Mr. Pearson's office to enter Somerset House, and then became British Resident, he never forsook his first love—architecture. He designed the Anglican Cathedral at Mombassa and the High Courts, the Post Office and Prison at Zanzibar and the Residency. His latest works are the Peace Memorial Building at Zanzibar, the reconstructing of the Governor's Palace at Dar-es-Salaam, which was shelled during the war by British warships.

THE BRITISH EMPIRE GAS EXHIBIT AT WEMBLEY

A LUNCHEON arranged by the British Empire as Exhibition Committee at the Lucullus estaurant, Wembley, to the Presidents and ouncils of the Royal Institute of British rchitects, the Society of Architects, the rchitectural Association, and the Architecture lub, took place on Monday, and was followed r an inspection of the exhibits and a reception id tea later on. At the luncheon, the chair as occupied by Mr. F. W. Goodenough, Chair- an of the Gas Exhibition Executive Com- ittee, who proposed the toast of "The King" id "Art and Industry," and the toast "The as Exhibition" was proposed by Sir Lawrence eaver, K.B.E., and responded to by Mr. . J. Sandeman, of the Croydon Gas Co.

Sir J. W. Simpson, K.B.E., in replying for Art and Industry," said when they considered e incalculable number of trades and manu- ctures concerned in producing the buildings of e Exhibition—apart altogether from exhibits -they would understand the truth of the pro- erb, "*Quand le batiment va tout va*"—"When the uilding trade prospers *all* prosper." Not only enerally recognised building materials (steel, ement, bricks, glass, timber) were required, ut they called to their aid infinite ramifications f these trades—coal, railways, motors, textile eavers, machines, and their makers—to say othing of the fine arts. He was persuaded at in the future architectural inspiration would ome from constructional forms quite other an those imposed in the past by brick and tone. For all that art tradition would be carried on; the work of their mighty predecessors would always be the touchstone of their achievement. Study of antique was never more necessary.

BRANCEPETH WELFARE SCHEME

THE Committee of the Brancepeth Collieries Welfare Scheme are proposing to erect at Willington, co. Durham, an institute for recreation of a very comprehensive character.

The site is one of two acres, and it is proposed to erect buildings in three blocks, the central block comprising billiard room, gymnasium, reading room, library, games room, meeting rooms, &c., with a single-story caretaker's house on one side and a group of slipper and spray baths on the other. The eastern block is to comprise an assembly hall with a total accommodation in main floor and balcony of 600, which will be available for concerts, lectures, meetings, or as a cinema. The west-end block is to provide a large plunge bath in a suitable building, and advantage is taken of the fall in the ground from north to south to provide for the sloping floor of the main hall and the necessary fall to the bath.

The buildings are simple in character, and it is proposed to erect them of sand-faced brick and roofed with tiles. The grounds are to be laid out with bowling green and tennis courts, and advantage is taken of the lower portion of the site to provide a children's playground and make a sailing pond by diverting the stream which runs along the boundary.

The total estimated cost of the buildings and lay-out of grounds is £18,000; and the architects who were awarded first place in a limited competition for the work are Messrs. Hays & Gray, AA.R.I.B.A., of Wingate, co. Durham, and North Shields. The perspective view is by Mr. Keesey.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

We are glad to give questions and answers cannot accept responsibility for contributed es, especially on legal matters.

ay we appeal to our correspondents to it their queries on paper of a size easily and written as legibly as possible, or better in typescript?—ED.

Insulating.

R,—I shall be obliged if you can advise s to a suitable method of insulating a osed store to keep it at one temperature 75 deg. Fahr.) all the year round. The ling would be one story, 40 ft. by 65 ft. ft. clear height, and with flat roof. A erate amount of light would be necessary lantern lights.

rk has been suggested as being suitable; how should it be fixed, &c.?

"INSULATION."

Columbian Pine.

R,—Like your correspondent, we were very h impressed with the beautiful figuring in mbian pine doors. We feared the ssive shrinkage, but on a test we made about years ago we found that our fears were unded. We have since used these doors on ral houses with complete success.

C. & F. B.

A Wall-Destroying Grub.

R,—Can you tell me the name of the grub h attacks stone and brick walls? I have one wall in Northamptonshire which has eaten away somewhat considerably, and ick wall in Buckinghamshire which has been ly eaten through. The grub is about one-third of an inch long, and the wall is honeycombed with its borings. "J. J. D."

Vertical Glazed Tiling.

[REPLY TO E. W. TURNER.]

SIR,—There are so many tile surrounds to fireplaces that are bedded in cement and stand quite perfect that it is probable the cases of failure noticed by your correspondent are rather due to bad workmanship than to the use of Portland cement.

The tiles selected need to have a well-keyed back and the backing to be a strong well-mixed composition and well and evenly spread. Any little cavities left will naturally trap air that will expand under heat and in time force the tiles away from the backing. An excess of sand in the backing, whether generally or in places due to imperfect mixing, will also lead to the loosening of tiles. M. M.

Cracks in Concrete.

[REPLY TO A. R. B.]

SIR,—The core and surfacing of concrete steps should, to be quite satisfactory, be laid in one process, and provided the aggregate is not so coarse as to show through to the surface the latter will naturally work up to a sufficiently smooth face. If concrete is applied to a core that has once set adhesion is not assured, and the distinct change of composition leads to a difference in expansion co-efficient that will almost inevitably reveal itself in external cracks.

In the case of the brick cills faced with cement the cracks are probably the result of too rich a mixture of cement. Two parts of sand to one of cement is quite fine enough for the purpose.

F. H.

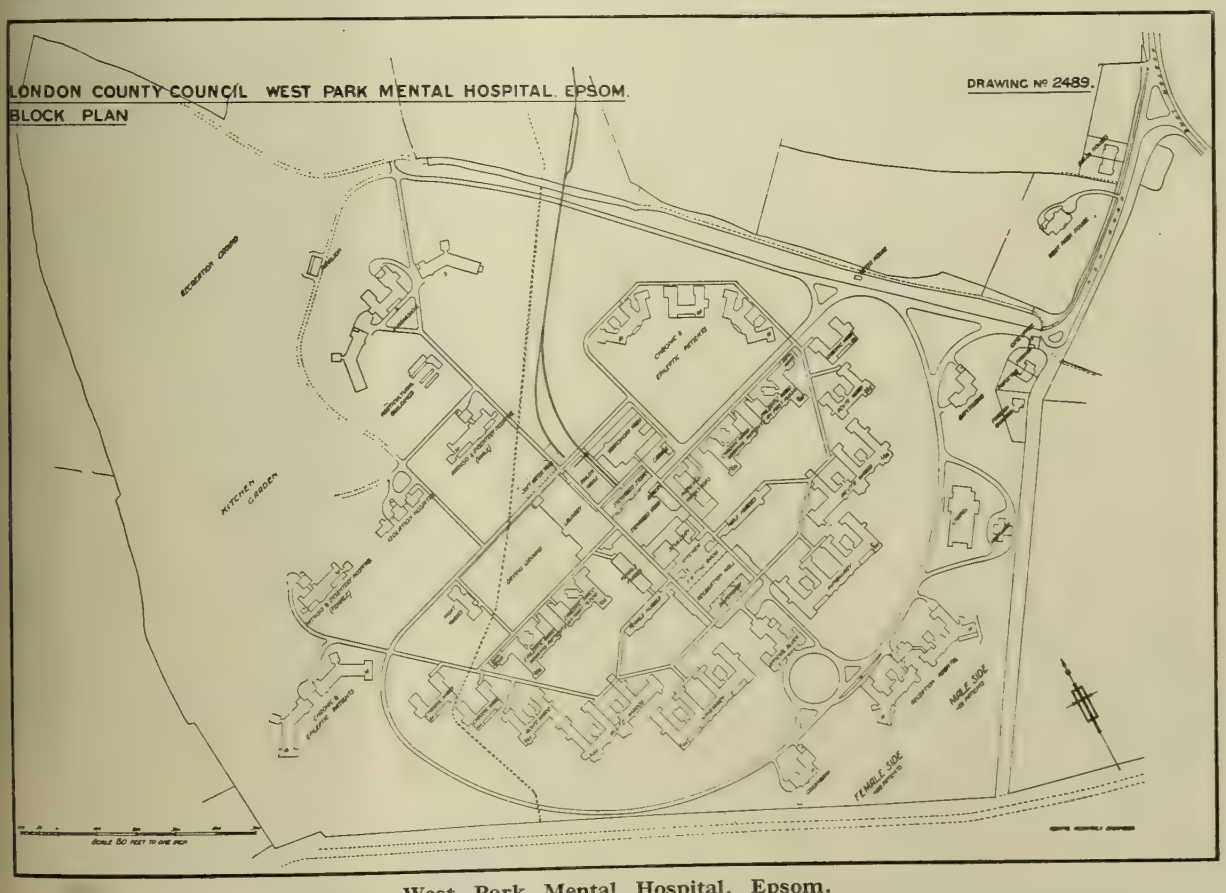
Cubicle Doors.

[REPLY TO "LINCOLN'S INN."]

SIR,—Probably the best form of construction for the purpose would be doors of sheet metal stiffened in light "L" iron frames with hinges, and locks and furniture rivetted or bolted to same. Unless ordered in considerable bulk, however, this is likely to work out rather costly.

Perhaps the most economical and efficient method would be to form the doors of two thicknesses of 1½ in. boarding, the outer being vertical and the inner horizontal, and secured together with stud-headed nails driven through both thicknesses and clamped over on the inside. The studs give quite a rich effect to the plain surface, and the form of construction is designed so that the warping tendencies of the boards tend to neutralise and resist each other. It is a method frequently adopted in the construction of church doors, and should admirably suit the purpose in question. P. R.

Stoves.



[REPLY TO "LIVERPOOL."]

SIR,—Your correspondent will find several stoves advertised which should answer the requirements he needs.

He will, however, do well to treat with reserve the claims that many makers make to serve domestic hot water and radiators off the same circulation. Two boilers heated by one fire, or a boiler with two separate jackets, or a calorifier for the domestic hot water, are much more satisfactory. The other arrangement so often gives disappointing results owing to the continual loss of heat when water is drawn off, not to mention the ultimate furring up of pipes and radiators owing to the continual change of water within them. L. W. N

The Society of Architects.

The first of the scholarships for the study of modern architecture abroad, recently instituted by the Society of Architects, has been awarded to Mr. W. Harding Thompson, Lecturer in Town Planning and Civic Design at the Architectural Association Schools. The jury responsible for the award was composed of Messrs. Arthur J. Davis, H. V. Lanchester, Howard M. Robertson, L. Sylvester Sullivan, and Lt.-Col. H. P. L. Cart de Lafontaine.

West Park Mental Hospital, Epsom.

MR. CLIFFORD SMITH, O.B.E., F.R.I.B.A., (L.C.C. Mental Hospitals Engineer), Architect; associated with MR. LEOLIN C. GREGORY, A.R.I.B.A.

LEGAL SECTION

NOTES ON CURRENT CASES

Options to Purchase.

It is a very common thing in leases to insert an option to purchase, and sometimes the parties insert in agreements such terms themselves, yet on hardly any point of law is it more important to take legal advice and proceed formally if litigation is to be avoided.

Rider *v.* Ford (1923, 1 Ch. 541), which we noted and commented upon in our issue for August 3, 1923, is one example of an informal option being contained merely in a letter which formed the agreement between the parties; and another example is furnished in the recent case of Sherwood *v.* Tucker (*Weekly Notes*, May 10), where the parties themselves without legal advice had extended the operation of a lease, and the question arose whether an option granted in the original lease could be exercised in this extended period.

By an agreement in writing, dated October 29, 1914, a certain house had been let by the defendant (the landlord) to the plaintiff as tenant for three years; the landlord to do external repairs and the tenant internal repairs, and the agreement provided that "the said tenant shall have the right to purchase the said house and premises during the three years hereby provided for, for the sum of £700 sterling." In June, 1917, the term still being current, the parties added and signed the following endorsement, "We, the undersigned, hereby agree that this lease be extended for three years expiring December 25, 1920." In September, 1920, the parties in the same terms extended the lease for a further period expiring December 25, 1923. These endorsements had been settled by the parties themselves without legal aid, but they were duly stamped.

On September 17, 1923, the tenant's solicitor gave the landlord notice that the tenant intended to exercise the option to purchase and asked for an abstract of title. The landlord's solicitor replied that the option had long since expired, and after correspondence the plaintiff issued a summons for a declaration that upon the construction of the agreement and the two endorsements the option was exercisable on September 17, 1923, and had been duly exercised by the notice of that date.

The point may seem a simple one, but it is not. There is a distinction between options which have to be exercised during a specified period within the term of a lease and those where there is no such specific time limit. This case fell within the first category, for there was a time limit within which the option must be exercised, and in such cases it has been held that the option is a collateral provision and not one of the terms regulating the relations of landlord which continue to apply where a tenant is holding over as yearly tenant after the expiration of the lease (see Bradbury *v.* Grimble, 1920, 2 Ch. 548; *The Builder*, September 24, 1920). The Court, therefore, had to consider whether the endorsements made by the parties had the effect of extending the whole lease with all its terms, collateral or otherwise, intact, or whether they merely extended the term of the lease, and with some hesitation the Court held that the whole lease was extended, and therefore the plaintiff could exercise, and had exercised, the option and was entitled to the declaration asked for.

Since the above decision was given, there has been another case upon this question, Batchelor *v.* Murphy (*Weekly Notes*, June 7). In 1913, premises had been demised to a lessee for a term of 10½ years from October 6, 1913, and the lease contained an option for the lessee (and his executors, administrators and assigns, when the context so admitted), to purchase the freehold for £3,000 upon giving three months' notice in writing of his desire to do so during the term.

The lessor had died on May 22, 1915, and her will had been proved by one of her two executors alone. The lessee being desirous of disposing of the residue of the term of the lease and of freeing himself from all liability under it, an agreement had been entered into in the form of a memorandum addressed to the executor, signed by the plaintiff who was a second executor, and the defendants, who were to become lessees. The memorandum was as follows: "In consideration of you agreeing to release me, the undersigned H. W. Clarkson (the lessee) and accept us, the undersigned, A. H. Murphy and C. L. Murphy (the defendants), as lessees for the unexpired residue of the term in the lease, dated October 17, 1913, we respectively agree as follows: The said H. W. Clarkson to surrender the said lease; the said A. H. Murphy and C. L. Murphy to execute a new lease for the unexpired term of eight years and six months from October 6 last on the same terms and conditions in all respects as the lease of October 17, 1913, with the exception of a small alteration in the rent."

The executor who had originally taken out probate having died, the plaintiff had taken out probate, and by this summons was raising the question whether the defendants were entitled to exercise the option of purchase.

The Court cited Bradbury's case (which is reported under the title In *re* Leeds and Batley Breweries, Ltd., and Bradbury's Lease) to the effect that a covenant conferring an option to purchase was a matter of collateral bargain, and no part of the terms of the tenancy in the strict sense, and said the question to be considered was whether there was any agreement for the renewal of the option to purchase, but held that was not the case here. The memorandum provided for the grant of a new lease but there was no express or implied provision in it which would import into it a collateral bargain in the original lease and the defendants were not entitled to the benefit of the option.

Rider *v.* Ford, which we noted August 3, 1923, is an example of a case where there was no time limit within which the option had to be exercised, and in such cases the Court laid it down that the option exists so long as the relationship of landlord and tenant continues, but it will be remembered that there was a double option in that case, an option either to purchase the freehold or to obtain a demise of the premises for 97 years at a particular ground rent and the payment of a premium. It was held that the option to purchase the freehold would offend against the law of perpetuities, but that the other option to call for a lease could be exercised.

In that case no formal lease had ever been executed, the defendants went into occupation under the terms of a letter on March 25, 1908, which gave them the option to take the house for three, five, or seven years, with the options we have mentioned above, and they had continued in possession and were occupying as tenants from year to year when the plaintiff in 1922 gave them notice to quit and then they claimed to exercise the options. It may be noticed that in Bradbury's case the Court delivered a dictum (it was only a dictum because it was not necessary to the decision delivered) that an option to purchase was inconsistent with the relation which exists when tenants are holding over as tenants from year to year, as the exercise of the option would put an end to the tenancy, and, therefore, could not be one of the terms of a tenancy incorporated into the tenancy from year to year. It is important to note that in Roper's case this dictum appears not to have been followed, as the Court only held against the option to purchase because it offended against the rule against perpetuities.

Covenants Against Underletting.

One of the most complicated branches of the law arises out of covenants in leases not to assign, or to part with the premises, or to underlet the same without the consent of the landlord, and the remedies for the breach of such a covenant. We have noted several such cases recently, but the latest case is Russ and Another *v.* Beecham and Another (19 1 K.B. 525).

The plaintiffs were the trustees of the will the Duke of Bedford who, by an indentu dated November 9, 1899, had leased certa premises to one R. Smith for a term of thir years from March 25, 1899, at a rent of £1 a year. The lease contained the followi covenant: "The lessee shall not, nor will during the last 10 years of the said term here granted, assign or part with this lease or t premises hereby demised, or any part there without the licence or consent" of the les or his agents. There was also a condition f re-entry for breach of covenant.

After divers assignments, in September, 192 the term had become vested in the defenda Sir T. Beecham.

In the same month he had mortgaged t said term except the last day thereof to t defendant Mathews, and there was a secon mortgage to the same defendant, subject to t first mortgage, of the said term all but the la two days thereof. Both these mortgages h been made with the consent of the plaintif and in both indentures it was provided that t powers of leasing conferred on mortgagors b section 18 subsection (1) of the Conveyancin Act, 1881, should not be exercisable by t borrower, the defendant Beecham, who becan tenant at will of the mortgagee.

By an agreement in writing Beecham, o November 23, 1921, let to one Grice two princip rooms in the premises for three years, the tena to have the option of continuing the tenan so long as Beecham should remain lessee of t premises, and this agreement was entered in without the consent of the Duke or his agent On August 15, 1922, the plaintiffs witho serving upon Beecham any notice in writi specifying the breach complained of, or requirin it to be remedied as provided by section subsection (1) of the Conveyancing Act, 188 issued the writ in this action claiming that t lease was forfeited by reason of this letting of t two rooms without consent and possession.

The Court below had decided the case in favo of the defendant on grounds which were n accepted by the Court of Appeal.

The majority in the Court of Appeal decid the case in the defendant's favour on a ve technical ground that the words which we used in this covenant in connection wi the lease or premises "assign or part with have received a definite interpretation in t decided cases, Doe *v.* Hogg (4 D. & R. 22 and Crusoe *v.* Bugby (W.B. 1 766) which t Court must follow that these words in th context mean "part with absolutely" "completely," excluding a mere change occupancy, and the underletting in this ca was not such a parting with either the lease the premises. The usual expression used such covenants is "part with the possession the premises," and in the absence of th expression as the words "part with," even ordinary language, are ambiguous the Cou felt constrained to interpret them according the interpretation placed upon them over very long period of years by legal decisions.

The point to note, therefore, is that in su covenants it is essential to insert "possession or some term which will prohibit a change occupancy.

Lord Justice Scrutton decided the ca upon different grounds. Under section subsection (1) of the Conveyancing Act, 188 a right of forfeiture for the breach of a stipulation in a lease is not enforceable by acti unless notice of the breach complained of h been given, and, if the breach is capable remedy, the lessee fails to remedy the breac By subsection (6) this section does not exte to a covenant or condition against the assignin parting with the possession, or disposing of t premises.

Lord Justice Scrutton expressed no opini on the point decided by the other members of t

rt, but confined his judgment to holding the case did not come within subsection (6) use on the authority of Church *v.* Brown Ves 258) a covenant not to part with possession of premises does not restrain a tenant from ing with part of the premises, and, therefore, ce of the breach and an opportunity of edy must be given under section 14 subion (1) before forfeiture could be enforced.

'e have dealt with this latter point in connec- with several cases. In Cottell *v.* Baker *The Builder*, March 26, 1920) it arose in nection with the Rent Restriction Acts, re sub-tenants, to whom a part of the pres had been sub-let in breach of a covenant to underlet or assign the premises without sent, were held to be "tenants" and not passers, because in Wilson *v.* Rosenthal 6, 22, T.L.R. 233) it had been held that a enant not to underlet without consent did apply to an underletting of only part of the mises. In Terrell *v.* Chatterton (see *The lder*, July 28, 1922) the Court of Appeal ner expressed a doubt if this was the law, but such doubt was set at rest when Terrell hatterton was decided in the House of Lords 23, A.C. 578; *The Builder*, December, 28, 3), when Lord Wrenbury said, "It is said with truth that if there be a covenant not assign or underlet the premises it is not a ach to assign or sublet part of the premises," ough in that case it will be remembered that vas held that if there are two transactions, t a subletting with consent of part of the mises, followed by a subletting of the whole the rest, that does constitute a breach of the enant.

Then in Elliott *v.* Jackson and Simons (1923, Ch. 373, *The Builder*, July 27, 1923), it was d that a covenant "not to share the possession any part of the premises without consent" s not within subsection (6) of section 14 subtion (1) of the Conveyancing Act, 1881, and erefore notice of breach must be given before feiture.

Note.

We desire to give a word of explanation as gards our note in the Legal Section, May 30, the case Hewitt *v.* Rowlands.

That case was the subject of appeal after our te was written and a report of the appeal only peared after it was published (see *Weekly otes*, May 31). As regards that case, the Court Appeal having first obtained further infortation from the District Registrar as to how the mages had been assessed, remitted the case to m with a fuller direction than had been given the Divisional Court as to the principles to be plied in the assessment, and referred to ircott *v.* Wakely, a case which in our note we id pointed out bore upon the subject.

In our note on this case we also referred incintally to the case Calthorpe *v.* McOscar, and the courtesy of correspondents we were formed that the decision of Mr. Justice cCardie in this case had also been reversed by ie Court of Appeal on December 14. A full port of this appeal only appeared in the Law eports for June, which were published five days ter our note was published, but no brief report as given in the *Weekly Notes* of the appeal iortly after it was heard, as is customary in ises of importance, and therefore at the time writing we were unaware of the appeal. The ly mention of the appeal in the *Weekly Notes* hich we can find is an entry in the "Record of usiness" in the Court of Appeal where the case ppears *sub nomine* Anstruther–Gough–Calorpe *v.* McOscar "appeal from McCardie, J., llowed." We shall treat of both cases as ppealed in an early Legal Section.

Architect's Estate.

Mr. William Willink, F.R.I.B.A., J.P., of Bern Hey, Livingston-drive, Liverpool, and unard-buildings, Liverpool, who designed any buildings in Liverpool and Lancashire, ormerly chairman of the Leeds and Liverpool anal Company and an Alderman of the City Council (net personalty, £5,661), £12,821.

RENT ACT

SEPARATE FLATS: APPORTIONMENT

The decisions under the Rent Restriction Acts are now so numerous and often so difficult to reconcile one with the other that even the lawyers find it a hard task to expound the law as laid down in them, as happened for a long while under the Workmen's Compensation Acts. In our issue June 6 we noted a case on apportionment, decided by the Court of Appeal, Sutton *v.* Begley, which seemed to clear up some questions but a further point has been raised in a Divisional Court in the recent case Lelyveld *v.* Peppercorn (*Weekly Notes*, June 14).

A lease of a house in Islington consisting of a basement and three other floors had been acquired by the appellant in this case, in 1897, and at first he had occupied the whole house himself, but at some time before August, 1914, he had sublet to separate tenants the second and third floors. The first floor consisted of two rooms, and on a half-landing two other rooms, and subsequently, but before August, 1914, two of these rooms had been sublet to another tenant at a weekly rent of 10s. In August, 1922, these four rooms were let to the respondent at a rent of £1 2s. 6d. a week, or £58 10s. a year. The respondent stated in the case that he understood the standard rent of the whole house to be £70, and he made an application for an apportionment of rent as regards these four rooms to the County Court, and the application had been granted. The Divisional Court reversed this decision. Section 12 subsection (1) (*a*) of the Rent Act, 1920, defines the standard rent as the rent at which the dwelling-house was let on August 3, 1914, or where the dwelling-house was not let on that date the rent at which it was last let before that date, or in the case of a dwelling-house which was first let after August 3, 1914, the rent at which it was first let. The Court held that the first alternative did not apply because the house was not let as a whole on August 3, 1914, the second alternative did not apply because it could not be said that the house was entirely unlet at that date as parts of it were let, and the last alternative did not apply as the house was not let as a whole after that date, therefore the standard rent as a whole, which it was sought to apportion, did not exist, and the standard rent of the flat was that at which it was first let to the respondent. The court distinguished Woodhead *v.* Putnam (1923, 1 K.B. 252; *The Builder*, December 8, 1922), because in that case the house had been let as a whole in 1914. That justice was done cannot be denied, as from the report in the *Times* it appears that the respondent was the tenant of the two rooms on the first-floor first let, and that if the apportionment had stood he would have got the four rooms at the same rent as he had originally paid for those two rooms, but hard cases do not make good law, and in Sutton's case the Court of Appeal was constrained to hold that the rent must be apportioned, although the Court expressed itself strongly on the absence of merits from the tenants' case.

That case is distinguishable from the decision in this case, for there the house which had been used for military purposes during the war was first let in March, 1921, and subsequently a part was sublet. The standard rent was taken as the rent at which the whole house was let in March, 1921, and was apportioned as to that portion subsequently let off.

The point raised in the case we are now considering appears not to have been decided before, but the only comment that can be made upon the decision is that in finding that there was no standard rent of the whole house in existence to be apportioned under section 12 subsection (1) (*a*) the court did not define how far back the words of this section contemplate reference being made. The words are "where the dwelling house was not let at that date," that is, August 3, 1914, "the rent at which it was last let before that date." The terms on which the appellant held the house under the lease from 1897 were not stated. The settlement of this point may arise in other cases.

ANCIENT LIGHTS

DAMAGES FOR THREATENED OBSTRUCTION

In our issue May 25, 1923, we noted the case Slack *v.* Leeds Industrial Co-operative Society, Ltd., in which the Court of Appeal felt constrained, by dicta of long standing, expressed by that Court in the case Dreyfus *v.* Peruvian Guano Co. (1889) 43 Ch. D. 316), to hold that in a case of threatened injury to ancient lights the Court had no jurisdiction under Lord Cairns's Act to award damages in lieu of an injunction.

It is, therefore, important to note that this case has been carried to the House of Lords (see *Weekly Notes*, June 7), and that the majority in that final tribunal have held that Lord Cairns's Act empowered the Court in such cases to award damages in lieu of an injunction.

In this case in the Court of first instance it had been held that had the building been completed the extent of obstruction would only have been such as would have justified the Court in awarding damages in lieu of an injunction, but that the Court could not adopt this course because of the decision in the Dreyfus case. The Court of Appeal did not go into the merits of the case, but held that the Judge had rightly held he had no jurisdiction to award damages because of the decision in that case. The House of Lords having power to over-rule the decision of the Court of Appeal in Dreyfus's case have now given this very important decision, and have held that to say that the power to give damages in Lord Cairns's Act applied only to what had already been done, was inconsistent with the terms of that Act, and would nullify the provisions that damages might be given in substitution for an injunction.

The terms of Lord Cairns's Act in section 2 are: "In all cases in which the Court of Chancery has jurisdiction to entertain an application for an injunction against . . . the commission . . . of any wrongful act, it shall be lawful for the same Court if it shall think fit, to award damages to the party injured, either in addition to or in substitution for such injunction."

Lord Cairns's Act was passed in 1858, since which date great changes have been effected in the constitution and practice of the Courts by the Judicature Acts, and in 1883 Lord Cairns's Act was repealed by the Statute Law Revision Act of that year, but the House of Lords in this case have unanimously held that by the combined operation of several Statutes the jurisdiction conferred by Lord Cairns's Act is preserved and remains unaffected.

We may revert to this case when it is reported at length in the *Law Reports*, but the point decided is of such importance in ancient light cases that we draw attention to it at once.

West Country Architects' Excursion.

The Wessex Society of Architects, which consists of the Bristol and Gloucestershire Societies, recently had an excursion through the county of Gloucester. At Northbeach, the fifteenth century church and other old buildings in the town were examined. At Chipping Campden the almshouses and other buildings, dating from the fourteenth to the eighteenth centuries, were visited. Amongst the members of the party were Mr. G. C. Lawrence, F.R.I.B.A. (President of the Wessex Society); Mr. W. S. Skinner, F.R.I.B.A. (President of the Bristol Society), and Mr. G. P. Milnes (President of the Gloucestershire Association). The sub-committee responsible for the arrangements consisted of Messrs. T. Overbury, C. W. Yates, and H. Stratton Davis (Hon. Secretary of the Wessex Society of Architects).

THE WEEK IN PARLIAMENT

Wages in New York.

Mr. Shaw, Minister of Labour, informed Mr. Comyns Carr that the hourly rates of wages current in New York City in November last were 1 dollar 30 cents for bricklayers and plasterers, and 1 dollar 12½ cents for carpenters and joiners and slaters. A subsequent report of March 24 stated that the average base pay in New York City was then 10½ dollars per day, and that bricklayers were receiving bonuses of 1 dollar and 2 dollars above the agreed rate of 12 dollars per day on most work, and that a similar bonus was being paid to plasterers on many buildings. The latest reports indicated a high level of activity in the building trades in New York City, practically all operatives being in employment. The large majority of building operatives in the United States had a 44-hour working week.

Office of Works' Houses.

Mr. Jowett, First Commissioner of Works, informed Mr. D. G. Somerville that the policy laid down twelve months ago in regard to all the estate under his Department is to sell houses whenever a suitable offer was received.

The Building Committee.

Mr. Wheatley informed Sir P. Pilditch that he proposed to set up an organisation representative of the persons in the building industry and in the provision of materials to advise him on questions connected with the carrying out of the housing scheme, and to take all possible steps within the industry itself to facilitate the success of the scheme. He did not think it would be necessary to take statutory powers for this purpose.

Progress of Private Enterprise.

Mr. Wheatley informed Captain Elliott that 26,750 houses were under construction on the 1st inst. by private enterprise in connection with schemes approved under the Housing, &c., Act, 1923, and a further 56,660 had been approved but not commenced at that date.

Bricklayers and Plasterers.

Mr. Wheatley informed Captain Elliott that the number of bricklayers employed on June 1 on houses in course of construction by local authorities under the Housing, Town Planning, &c., Act, 1919, was 381. The number of plasterers employed on June 1 on houses in course of construction by local authorities under the Housing, Town Planning, &c., Act, 1919, was 320.

Price of Houses.

Mr. Wheatley informed Sir C. Morrison-Bell that the average prices of houses included in contracts let by local authorities under the Housing, &c., Act, 1923, during the last six months, excluding the cost of land and development, were £404 for non-parlour, and £454 for parlour houses.

Demolition of Houses.

Asked by Mr. T. Thomson if he would take powers in his Housing Bill to restore to local authorities their right of preventing the demolition of existing dwelling houses or their conversion into premises for other uses so long as the shortage of houses continued, Mr. Wheatley said he did not propose to deal with this matter in the present Housing Bill.

Local Authorities' Schemes.

Mr. Wheatley informed Captain Elliott that the position of local authorities' housing schemes under the Housing Acts of 1919 and 1923 on June 1, was as follows :—

	Housing Acts of		
	1919.	1923.	Total.
Number of houses under construction	2,931	12,752	15,683
Number of houses in approved schemes not yet commenced	365	30,900	31,205

As regarded slum clearances, schemes had been approved which would involve the provision of approximately 5,894 houses; tenders had been approved covering 1,090 houses.

Builders' Guarantee.

Lord E. Percy asked the Minister whether he had received any written guarantee or offer from the building trade, other than the Report of the National House Building Committee, or any written intimation from the trade that they regarded his arrangement with the local authorities as satisfying the conditions laid down in that Report ?

Mr. Wheatley said the offer from the building trade was contained in the Report to which the noble Lord referred.

Replying to further questions from Lord E. Percy and Mr. D. G. Somerville, Mr. Wheatley said he had no evidence that there was any dissatisfaction with the arrangement in the building industry. Everything was proceeding very smoothly and satisfactorily.

Augmentation of Labour.

Mr. Wheatley informed Sir K. Wood that the building industry proposed that building trade labourers should be accepted as apprentices under their scheme for augmenting the industry, and while apprentices were ordinarily to be accepted up to the age of 20, special arrangements might be made in the case of building trade labourers.

Skilled Workers.

Mr. Wheatley informed Mr. D. G. Somerville that complete information was not available as to the number of skilled workers in the building trade in 1913 and 1924, but the following table gave particulars in regard to the principal occupations for 1901, 1911, and 1923 :—

Occupation.	Number of skilled men employed in the building trade in England and Wales.		
	Census, 1901.	Census, 1911.	October, 1923.*
Bricklayers	109,160	92,312	53,630
Carpenters & Joiners	243,075	176,978	106,880
Plasterers	27,544	21,230	13,910
Slaters	8,461	6,946	2,880
Masons	63,129	42,896	16,580
Painters, Decorators, &c.	143,150†	154,929	97,480
Plumbers, Gasfitters, Glaziers, &c.	68,562†	70,303	28,430

*The figures for 1923 represent the numbers of insured workpeople working for employers and, consequently, they are not strictly comparable with the Census figures.

†In the Census for 1901 the figures for Glaziers are included with Painters.

White Lead Convention.

Mr. Henderson, Home Secretary, informed Mr. E. Brown that the ratification of the White Lead Convention was supported by the master painters, the operative painters, and the building trades operatives; and was opposed by the white lead manufacturers, the workers in the white lead factories, the Federation of Building Trade Employers, and the paint and colour manufacturers.

Scottish Smallholders.

In reply to Mr. Livingstone, who asked, in the House of Commons, whether the benefits of the proposed housing scheme would be available for Scottish smallholders, who either built their own houses, or had them built for them, at their expense, by the Board of Agriculture under a land settlement scheme, Mr. Stewart (Parliamentary Secretary to the Scottish Board of Health) said that the subsidy proposed under the Housing (Financial Provisions) Bill was intended to be provided only in the case of houses built for letting, and accordingly would not be available for the class of builders referred to. Such persons would, however, continue to be eligible for the assistance from local authorities provided for in Section 2 of the Housing, &c., Act, 1923, and would be able to apply for loans from the Board of Agriculture under the provisions of the Small Landholders' Acts.

The Housing Bill.

Mr. Wheatley, the Minister of Health, moved the second reading of the Housing (Financial Provisions) Bill in the House of Commons on Monday. The measure, he explained, proposed to amend the financial provisions of the Act of 1923. That Act provided for a subsidy being paid on houses conforming to the conditions laid down in that Act and completed before October next year. Clause 1 of the new Bill extended that period for fifteen years. Clause 2 increased the subsidy from £6 for twenty years to £9 for forty years. The primary object of the Bill was to secure continuity in the building of working-class houses, and the measure, he felt, in its essentials had a reasonable prospect of passing the House as an agreed measure. The essentials of the Bill were a treaty with the building industry, a treaty with the local authorities, and a charter for the tenant. The basis of the agreement with the building industry was the production and delivery of working-class houses. The reasoned amendment to be moved by the Unionist Party stated that the proposals in the Bill were insufficient to provide the men. It suggested that the building industry, which said it could guarantee a certain number of houses per annum, did not know how to provide the men who were essential. But in the report submitted by the building industry, it was stated that a scheme for augmenting labour in the industry had been reached between the employers and the operatives for the first time in the history of the industry. The Government were entitled to take some credit for having secured that agreement. He had accepted a Liberal amendment laying it down that the subsidy might be withheld in the event of adequate preparations for the supply of materials and men not having been made. The acceptance of the amendment made the Committees which he had had in view from the outset more and more important, because their principal duties would be to see that the industry was augmented and that materials were available for the houses which it had been agreed to erect. If the industry did not fulfil its obligations, Parliament was relieved from its obligations, and the money which the scheme would cost would remain in the national pocket.

Sir W. Joynson-Hicks : But the necessity for houses will remain.

Mr. Wheatley said that put the nation under an obligation to test this scheme, which the building industry said was bound to succeed, and which the local authorities had agreed to promote for all they were worth. If, unfortunately, the building industry was not able to redeem its pledges there would be nothing left for the country but to turn in its despair to the servile system of house production undertaken by Mr. Chamberlain. The Government were leaving the supply of materials to private enterprise, subject to an agreement with the manufacturers and to the powers which they hoped Parliament would give them in another Bill now before the House. Further, they proposed to use the machinery of the Trade Facilities Committee to develop production. Short of a system of nationalisation, he contended that the Government had taken every necessary step to secure that production in abundance of the necessary materials would be realised. As to the argument that the Bill would increase the cost of production, he said that every possible provision had been made in the Bill to keep down the cost of house-building. The builders and operatives were given a very serious interest in keeping down the cost because if prices got unreasonably high, building would be stopped. The local authorities were also given a direct interest in keeping costs down. Nor was it true that his proposals would discourage private enterprise ; they would actually do more to promote private enterprise than any other measure which had come before the House recently. They were anything but Socialistic proposals. Although he thought private enterprise was out of date and ought to be scrapped, the country accepted it and he accepted it, and was trying to act honestly towards it. He was promoting a large market for houses and thus was creating a field for private enterprise. It was also absurd to say that the Bill put a larger burden on the State and the local authorities. He was actually putting on the local authorities a smaller burden than they were prepared to shoulder.

Lord E. Percy, on behalf of the Unionist Party, oved the following amendment :—" That this ouse cannot assent to the second reading of a ill which meets none of the difficulties, either regards labour or materials, that at present nit the building of houses, discourages private nterprise and private ownership, tends to crease costs, and throws an excessive burden on the State and the local authorities without y likelihood that an adequate supply of houses ill thereby be made available." He severely iticised the measure, describing the financial ovisions as unsound and impracticable. The ill was a milestone on the Minister's proposals in entirely wrong direction. The Government ould have concentrated on the replacement old houses by modern ones, and should have ven attention to those areas where private nterprise was not building houses in sufficient uantities. He denied that there was any greement with the building industry that would nd the industry. The Bill was an absolute and eartless sham.

From the character of the debate which llowed it was clear that the measure will be nsiderably amended in committee. Mr. asterman announced that Liberal members ould vote for the measure being taken in ommittee of the whole House, and not sent to Standing Committee. Mr. J. Sunlight, the iberal member for Shrewsbury, speaking as an rchitect with twenty years' experience, said he uld not support housing proposals which he as convinced would never succeed. Mr. H. ragg, a Unionist, and the member of a firm of rickmakers, advocated payment by results in ne building trade, which, he said, would increase utput by 50 per cent. Sir W. Joynson-Hicks ound up the debate for the Opposition, and Mr. . Greenwood made the final speech for the overnment.

The Unionists challenged a division on the mendment, which was rejected by 269 votes to 06, and the Bill was read a second time. The iberals on this occasion voted with the Govern- ent, but Mr. Masterman, a Liberal member, ext moved that the Bill be committed to a ommittee of the whole House. This was esisted by the Government, who were, however, efeated, Mr. Masterman's motion being carried y 315 votes to 175, in spite of Mr. Clynes' threat o keep the House sitting until September if ecessary. The decision not to send the Bill o a Standing Committee means that it will be uch more searchingly examined and amended n points of detail.

Rent Restrictions.

Asked by Sir K. Wood whether he proposed o introduce any further legislation in relation to victions or rent restrictions, the Prime Minister aid that after a careful review of the present osition of legislative proposals regarding ousing and of the fate of measures already ntroduced, the Government saw no opportunity o produce fresh proposals in addition to its Housing Bill.

Shortage of Bricks.

Mr. Greenwood informed Mr. Alden that the Minister of Health was aware that there was t present a shortage of bricks in many parts of he country, and he was informed that bricks were not always available in the quantities required at the prices which were recorded as the normal market prices. If the Housing Bill at present before the House was passed there was every prospect that in view of the assured demand for a long period a consider- able number of manufacturers would carry out extensions of plant and would reopen and refit works which had been closed down. It was proposed in the Building Materials (Charges and Supply) Bill to take powers to deal with unreasonable prices.

Shortage of Men.

Mr. Adamson informed Sir G. McCrae that the average monthly shortage of men in the building trades on housing schemes under the Housing (Town-Planning, &c. (Scotland), Act, 1919, in the year 1921, was 168.

BOOK REVIEWS

London on the Thames. By H. ORMSBY, B.Sc. (Econ.) (Sifton, Praed & Co., Ltd.)

That London owes its existence to the Thames is a self-evident fact, but to what extent the formation of the City was due to the river and its tributaries is not often realised. When one of the problems of to-day is the bridge traffic, while the waterway is deserted, it is natural that the original import- ance of the river should be somewhat discounted by those who seldom pass east of Tower Bridge.

It is surprising to learn that the Ordnance Survey has never produced a contoured map of London. The diagrams of "London on the Thames" offer many suggestions relating to the making of the City and its suburbs. We do not follow the authoress with reference to the influence of the streams on the line of the City wall which, she says, follows the trench carved out by the streams. As we under- stand it, the Walbrook failed to find access for all its waters through the City, and filled the moat that was made from Newgate to Tower Hill, leaving the Moorfields waterlogged. This stream was not allowed to interfere with the line of the wall, but it is true that the Holbourne, or Fleet River, determined the western bounds of the City. The book offers no solution to the problem: What caused the rectangular bend at Aldersgate? The Island of Thorney is also fully described with diagrams, which account for many interesting names surviving in modern Westminster, due to the numerous watercourses of the Westbourne and Tyburn. The history and topography of London as a port is dealt with. The old port, based on stream mouths and riverside quays, has gone, and a new port with its millions of tons of traffic, based on docks, has grown up below the City. The square mile of earth that carries the City would be lost in the midst of greater London to-day if it were not for the mile of river front that has prevented St. Paul's and the beautiful line of old churches from being hidden altogether from view by modern build- ings. But we ask, how long will it be before the post-"modern" erections do succeed in hiding our churches and monuments?

House and Home: A Manual and Text-book of Practical House-Planning. By GRETA GRAY, A.M. With 189 illustrations. (Phila- delphia, Chicago and London: J. B. Lippincott Company.) Price 10s. 6d. net.

The author of this work takes a wide outlook over a very extensive subject. The house and home of civilised man presents a complex problem, and this problem is discussed in minute detail from the standpoints of artistry, con- venience, construction and cost. The book embodies a considered attempt to indicate the several factors relative to the housing question in America, and to make them comprehensible to the general as well as to the technical reader.

The question why we are badly housed in ugly buildings is just as pertinent on this side of the Atlantic as upon the other, and in the Introduction the reader is informed that the reason is largely bound up in the fact that the efficient design of individual small houses is not a paying proposition to the architect even when he is paid at the rate of 10 per cent. for his services.

The remedy proposed is more study of their problem by all the people interested in home building; that is to say, everybody. "The less one can spend on a house the more essential it is to plan carefully to get all that can be had for the money available. If people who are about to build could work out on paper their own ideas and know that they were feasible, and if they had a basis for correctly evaluating the matters which must be considered in build- ing, and would then go to an architect with their sketches and ideas, the architect would have an easier task, and the house would be in better taste. Selection of plans from a book or giving over sketches to a contractor would not be so unsatisfactory if the owners knew how to choose wisely and if they knew what stipula- tions to make in a contract."

However it may be in America, where folks have a reputation for picking up ideas smartly, the suggestion that these very sensible proposi- tions should be applied in England would elevate the conditional "if" into the greatest promin- ence. For some extraordinary reason the aver- age home-builder in England seems to know or care very little about the things that ought to interest him in connection with his project, and it is an open question whether even this excellent book will shake him from his indifference. Will the prospective home-maker take to heart the advice given on several pages to think over his business slowly and seriously, or will he screw up his courage in a hurry, consult a builder and plunge into a contract without any more con- sideration than his neighbour, whose experiences might well have taught him wisdom?

The "Suggestions to Teachers and Study Group Leaders," contained in chapter xxii, open up a vision of an instructed public opinion, and in this lies, indeed, the only real hope of lasting improvement, for an architect, howsoever con- scientious, will not find himself in a position economically to search out on his own initiative and supply his client's lack of ability to give him rational instructions.

The successful design of a house which is also to be a home is intimately bound up with the knowledge of the processes that will be carried on within it, and this knowledge can best be obtained by experience. The problems enun- ciated at the end of each chapter are expressly directed towards encouraging the reader to connect the theory set forth in the book with the facts of his own case and their possible future improvement. This is in accordance with all architectural practice that has led to great achievements, and it is about as far from the "spray-background" methods of our art schools as could well be imagined. Several of the problems set are connected into a con- tinuous scheme beginning with the practical suggestion that the reader should "Find a lot as near your ideal as possible to cost not more than a determined sum, this sum to be that which your family can afford."

Not all the recommendations are so valuable, and the advice to "collect pictures of radiator screens which you might use to conceal radiators in your house" might be objected to on the grounds of economy and efficiency since the loss of heating power in a screened radiator is very considerable. This point is mentioned in the text, so the reader is fairly warned, but he might as an alternative have been instructed to invest in a form of heating apparatus that was not so unsightly as to need concealment.

The book contains a wealth of useful infor- mation, and can be recommended confidently to all classes of readers.

Modern Plumbing Illustrated. By R. M. STARBUCK. (New York: N. W. Henley Publishing Company.)

A book on modern plumbing as practised in the United States of America cannot but be of general interest to all concerned in building. The work before us is rather more comprehen- sive than its title would imply, and traverses much of the ground concerned with architectural hygiene, from water supply to septic tanks and the disposal of sewage. The author, although he has been closely associated with the various branches of plumbing for over half-a-century and has observed the vast strides made during that period, has wisely restricted the volume to the description and illustration of modern work in his country. Scullery and laundry fittings, bathroom fittings, and domestic and public sanitation generally for town and country are treated in short chapters, each preceded by a plate of illustrations. The chapters on cesspools and septic tanks are well illustrated and described, and provide useful information. Another useful chapter is that on the disposal of sewage from levels below the sewer into which it is to be discharged, as is necessary in the case of the basements of tall city buildings and in underground stations. A digest of the report issued by the British Local Government Board on the use of inter- cepting traps in house drains is appended.

THE BUILDING TRADE

THE CARE AND REPAIR OF FACTORY CHIMNEYS

By W. LARKINS.

[THE writer of this article is a well-known steeplejack, whose exploits in connection with the Nelson Column and other public buildings have been publicly recorded. He has had a wide experience in the construction and repair of factory chimneys, and the suggestions he makes in the following article are of interest.]

As a steeplejack few things have surprised me more than the indifference displayed by factory owners and managers towards the well-being of their chimney shafts. Whereas the man who starts out to build even a quite small house, costing perhaps no more than £500, will carefully see to it that it is erected exactly according to the proper plans and specifications, and with good sound material, the building of a chimney shaft, costing perhaps five, or even ten times £500, is left largely to chance. Of course, in large towns and cities the local building regulations are usually pretty strict, and a man can feel fairly safe; but in many country districts, where these regulations either do not exist or are largely ignored, a chimney can be built without proper foundations—"on the grass," as we say—and nobody is the wiser.

Chimney should not be Built too Quickly.

A man about to have a chimney shaft built should insist on the depth of 10 ft. of solid cement foundation for each 100 ft. of shaft, and proportionately, of course, for every fraction of 100 ft., so that a shaft 150 ft. high would require 15 ft. of foundation; one of 250 ft., 25 ft., and so on.

Another very important point to see to is that the chimney is not run up too quickly. When it is 40 ft. high work should be knocked off for a week to give it time to settle; then at 80 ft. there should be another week's rest, and so on, with every additional 40 ft. If this rule were regularly carried out and proper foundations put in there would be far less cracking and settling of new shafts than is now the case.

Even, however, if a chimney is known to be properly built, and is to all appearance perfectly sound and stable, it ought to be inspected regularly once in two years by a properly qualified steeplejack. Such an inspection only costs 30s., and it may mean the saving of hundreds of pounds later on. This seems so obvious that I should hesitate to labour the point did I not know from practical experience how difficult it is to get factory owners and managers to agree to it. A man with a fifty-guinea piano has it seen to regularly by a professional tuner. The man with a five-hundred guinea chimney is content to leave it alone until warned by its settling or cracking that something serious is the matter. Then, not infrequently, it is too late.

Inspection might have saved £3,000.

I had experience of a typical instance of this only a few months back, in connection with a shaft belonging to a brickworks company in Gloucestershire. The chimney was a new one, having only been built about six years. It was nearly 200 ft. high, and weighed approximately 1,500 tons.

About four years after it was put up I was informed a list became apparent. But no notice was taken of it, or, at all events, no proper steps were taken to have it remedied. It was assumed that, being a new chimney, there could not be anything radically wrong with it. (A common mistake, this! Regular inspection is even more necessary in the case of a new chimney than in that of an old one which has been seasoned by time and usage.)

Well, "things" were "let slide," and twelve months later it started cracking at the base. Still no notice was taken. Another year passed by. And now anyone could see that "something must be done."

Indeed, the owners had no choice in the matter, for as it happened the shaft stood close alongside the track of a great railway company's main line, and their officials had been keeping an eye upon it. One day the manager of the brickworks was served by the railway people with an intimation requiring him to either straighten the shaft at once or pull it down, as it was a menace to their property and a source of danger to passengers travelling over their line.

It was then that I was sent for—for the first time mind—to make an examination. I found the upper portion, above 10 ft., to be in fair condition. But the base was split in all directions; was in fact, little more than a pile of rubbish.

"The Chimney was Falling before my Eyes."

I plumbed 10 ft. of the base, and found that it moved 1-16th of an inch out of the perpendicular in five hours. This meant that the top had moved 2¾ inches in the same period. In short, the chimney was falling before my eyes. And—it was falling in the direction of the railway line.

Nothing can be done, under such circumstances, to straighten a shaft. Once a chimney begins to move any operation of this kind is out of the question. The only thing to be done in this case was to divert its fall from the railway company's property on to that belonging to the brickworks, and this I successfully accomplished, the trains, however, being held up as a matter of precaution while the work was being done.

Owing to the necessity of throwing the chimney without delay, and across the brickworks, considerable damage was done, and altogether the cost to the brickworks company, including the loss of the chimney, could hardly have been less than £4,000. Had I been called in two years earlier I could probably have rectified matters for a twenty-pound note. Four years earlier half that sum would almost certainly have sufficed.

Even without calling in the aid of a steeplejack, it is an easy matter for a manager to ascertain whether a chimney needs attention. All that is necessary is to plumb it at the base with an ordinary bricklayer's plumb-rule and bob. If it is found to be ever so slightly out of perpendicular it is a sign that something is amiss, and the services of a properly qualified steeplejack should at once be sought.

Where Prevention is Better than Cure.

Cracks not infrequently develop in quite new chimneys. These should be stopped at once, and this operation will save banding later on; also, the upper parts of all chimneys, new or old, should be kept well pointed, thereby preventing decay, which in time means rebuilding the upper part of the chimney, with its costly addition, expensive scaffolding. Special attention should be given to stone copings, as the iron cramps used by some builders often rust, causing the sections to work loose. Personally I am of opinion that iron cramps should not be used either in stone or brickwork in connection with chimneys, owing to their tendency to expand and contract with the variations of temperature, and whenever I find them I invariably advise the substitution of copper ones.

When Chimneys are Beyond Repair.

Once the copings go, of course, the damp gets in, the heat of the interior of the chimney draws it deeper and deeper, mortar perishes, the interstices widen, and the canker, often all unsuspected, eats its way into the very vitals of the shaft. When this process has gone too far, no amount of pointing will do any good, and the upper part of the chimney must be rebuilt. I have seen chimneys so bad that I have been able with my fingers to pick the bricks out from under the copings, and rebuilding operations running into hundreds of pounds have had to be undertaken; whereas, if the shaft had been periodically inspected and the mischief detected and grappled with in time, the expense would have been hardly as many shillings.

Still, with every care and precaution, stopped cracks will sometimes spread, chimneys newly pointed will occasionally open up again. When this happens, and not before, is the time for banding. Bands for circular shafts are made in three sections, and for octagon and square shafts in four sections. They range in size from 4 in. by ⅝ in. to about half those dimensions, and are of wrought iron, with lugs and bolts. A properly banded shaft is given an altogether new lease of life. In fact, it is often rendered stronger and more secure than when first put up.

Old and New Ways of Felling.

When a shaft has been permitted through neglect to get into so bad a state of dilapidation that neither pointing nor banding is any good, the only thing is to demolish it, by "felling," if space permits. The old way of doing this, which costs anything from £35 upwards, was to cut into the base, and prop up the gap with timber as the work proceeded. These wooden supports were then saturated with tar, paraffin, etc., and set on fire, when, of course, as they burned through, the chimney toppled over.

This cumbersome and costly plan is now almost entirely done away with, and an ordinary shaft can be "thrown" for about one-third of the cost. The method is based upon that used for felling trees, where the direction of the throw is regulated by the cut made in the wood. Starting at a point in the masonry immediately opposite to that which abuts upon the required line of fall, the shaft is attacked with chisels, care being taken to work evenly towards the centre line. By this means a shaft may be felled with a nicety and precision unattainable by the burning process—a point of the utmost importance where buildings or other shafts are in the immediate neighbourhood. Burning, it must be remembered, may take a week to carry out, with a heavy expense for timber, whilst the felling process may be done in an hour, and rarely takes beyond the one day.

In conclusion, I would like once more to urge upon all owners of chimney shafts the absolute necessity of having them periodically examined. Also, when repairs are found necessary, have them done at once. It is the cheapest in the long run.

Hull's New Pier.

A new pier and pontoon to replace the existing structure, known as Victoria Pier, Hull, overhead promenade and approaches, floating landing stage, hinged bridge and vehicle lift, piling and dredging, are to be provided at a cost of £200,000. Parliamentary sanction is being asked by the Corporation.

NATIONAL HOUSING AND TOWN-PLANNING COUNCIL

CONFERENCE ON HOUSING

A CONFERENCE of local authorities, convened by the National Housing and Town-Planning Council, was held on the 20th inst. at the Old County Hall, Spring-gardens, to consider how local authorities can most suitably take advantage of opportunities provided by the housing proposals of the Government.

Major C. P. Lovelock, in the absence of Mr. M. Elgood, presided. Mr. Aldridge, secretary, said the conference was one of a series that had been arranged for the week, others having been held at Manchester, Newcastle and Sheffield.

Mr. Aldridge, dealing with the memorandum of the Council explaining the financial provisions of the Housing Bill, 1924, said it was simply the bill shorn of its legal terminology. The Council considered Mr. Wheatley had acted wisely in extending to 15 years the period of the application of the Act of 1923 as far as Exchequer contributions were concerned. Recent figures showed that there were built, or building, upwards of 40,000 houses under Mr. Neville Chamberlain's Act of 1923, and over 80,000 were being built as a result of the aid to private enterprise. They were bound to take the line of seeking what was good in an Act or Bill instead of finding fault. Mr. Chamberlain deserved to be congratulated on the relative measure of success of his Act. But the Act last year had the grave fault—it concentrated action mainly on building houses for sale. Mr. Wheatley proposed to build houses to be let to the ordinary working man. In rural areas there was a reason why colliery owners should build houses and let them to their employees. Many local authorities had said they would not give a penny of subsidy money unless the price paid for houses was uninflated. At Birmingham and Carlisle, where men paid from 9s. a week rent, they had been enabled to become owners of houses in 20 years. Under the Rent Restriction Amendment Act of last year, as houses became detenanted they became decontrolled. It was a mistake, however, to suppose that detenanted houses provided the accommodation that was needed for the working man. Under the Addison scheme houses had been let at a rent which was within the range of working men at a time of a trade boom, but not at other times. It led to subletting. Mr. Wheatley proposed the amount of the increased contribution to be paid was £9 a year for 40 years, or if the house was situated in an agricultural parish in England and Wales, or in a rural area in Scotland, £12 10s. for 40 years. The Bill would lay down conditions defining "agricultural parish" and "rural area" for this purpose. Also that the houses were let for occupation to tenants who intended to reside in them, and not sold; that they should not be assigned or sublet by the tenants except with the consent of the local authority; that they should not be sold or otherwise disposed of except with the consent of the Minister or the Scottish Board of Health; that contracts for the construction of the houses should contain a fair wages clause; that the rents to be charged for the houses should not in the aggregate exceed the amount which would be payable if each house were let at the rent at present commonly charged in the area for pre-war working class-houses, except where the average deficit on the houses after receipt of the Exchequer subsidy would exceed the equivalent of £4 10s. a year for 40 years. It meant that houses would be let at a rent obtained for ordinary houses. Mr. Wheatley's scheme was not hypothetical but was on a basis at which ordinary working-class areas were let.

The increased contribution, as stated in the memorandum, would also be payable towards the expenses of local authorities assisting private building enterprise to provide houses for the working classes subject to special conditions similar to those applicable to houses provided by local authorities. As regards houses for which the increased contribution would be payable, the assistance given by local authorities should be by way of an annual payment for a period not exceeding forty years. They would not be empowered to give assistance by way of capital grant in respect of these houses. Assistance by way of capital grant would be restricted to houses provided under the provisions of the Housing, &c., Act, 1923, in respect of which the Exchequer contribution not exceeding £6 a year for twenty years would continue to be payable. If, in any case, the total assistance given by a local authority to private building enterprise was less than the equivalent of the increased Exchequer contribution, the local authority would receive from the Exchequer the equivalent of the total assistance given by them.

A similar provision would be made to that in the Housing, &c., Act, 1923, enabling the increased Exchequer contribution to be paid in certain circumstances direct to Societies or Companies who did not trade for profit, or whose constitution limited the rate of interest or dividend payable by the Society or Company provided they were prepared to accept the special conditions as to letting and rents.

The increased Exchequer contribution would only be payable in respect of houses provided by private building enterprise, or by Societies or Companies subject to the requirement that the rents should not exceed those which could be charged by local authorities if the houses had been provided by them. It was further proposed that houses provided under proposals approved after February 1, 1924, might be eligible for the increased contributions if they were subject to the special conditions as to lettings and rents. In the event of non-compliance with any of the special conditions attached to houses in respect of which the increased Exchequer contribution was payable, the annual contribution might be discontinued or suitably reduced.

The object of the proposals for which Exchequer provision was sought was the completion of approximately 2,500,000 houses of the type required in fifteen years. Negotiations had taken place with representatives of the building industry with the object of devising means for ensuring that there should be available the labour and materials necessary for the carrying out of such a programme at reasonable cost. The representatives of the industry had indicated that they were prepared to adopt means of augmenting the resources of the industry which would render practicable a programme for providing the following numbers of houses in each of the next fifteen years:

1925, 90,000; 1926, 100,000; 1927, 110,000; 1928, 120,000; 1929, 135,000; 1930, 150,000; 1931, 170,000; 1932, 190,000; 1933, 210,000; 1934, 225,000; 1935, 225,000; 1936, 225,000; 1937, 225,000; 1938, 225,000; 1939, 225,000.

Mr. Wheatley was preparing the way for the abolition of the Rent and Mortgage Act. When it was repealed we should enter into the freedom of housing in this country. Speaking generally of the greater part of industrial England, he suggested as a rent for the average house, 7s. a week, plus rates; £500 might be taken as the all-in cost. The amount payable as interest, £27 10s.; repairs, maintenance charges, £5 10s.; representing a total of £33. If from that total £18 4s., representing 7s. a week rent, were deducted, it meant a deficit of £14 16s. The Government contribution was £9, and that of the local authorities £4 10s., making a total of £13 10s. This left a balance of 26s. to be found by the tenant in increased rent, which meant you had to charge not 7s., but 7s. 6d.

The Bill provided an easily ascertainable basis for the rents to be charged. He was glad to see that landowners had shown much liberality in regard to the price of sites for houses, and if farmers, who had been relieved of one-half of the burden of their rates, were not now willing to contribute their quota of the contribution set out in the Bill, there arose the question whether there should not be some means of compelling them to prevent their villages from going out of existence.

In the course of discussion it was mentioned that, taking the wages of the agricultural labourer at 28s. a week, he could not fairly be asked to pay 4s. a week plus rates.

Mr. A. Edwards, of Barking, said houses now built and tenders accepted showed an annual loss of £18. Apart from the subsidy of £9, Barking would have to find another £9 for forty years. Was it fair that local authorities should be penalised to the extent of £9, while neighbouring authorities who did not build got off free? There would also be an influx into Barking. In response to a request for figures from Mr. H. H. Brown, Town Clerk of Gravesend, Mr. Edwards said that tenders of £436 had been withdrawn. They anticipated a £450 tender; in fact, an all-in cost of £470. Plus road-making it would bring the cost up to £570.

Mr. Aldridge remarked that if under the Wheatley scheme it were possible in the suburbs of London to let a house of the type suggested at 8s. 6d., plus rates, thousands of families would regard it as a great benefit. If 2,500,000 houses were built and 12,500,000 people provided with better houses, posterity would gain so much that the citizens of forty years hence might be left to bear the burden.

In the course of further discussion it appeared the general opinion that the rural rent could not be more than 3s.

Mr. Edwards then suggested that local authorities who did not do their duty, thus compelling other places to do more than their share, should be compelled to stand in. The case of Barking in this respect was one of great hardship, and they had a heavy loss on what they had done. He moved that the Conference declare the subsidy to be altogether inadequate, and that it should be substantially increased.

Mr. Marlow Reid, of the Middlesex County Council, urged that the levy of local contribution should be taken over a much wider area, perhaps even a County Council area, so that no locality should have the temptation and opportunity to neglect its duty. Greater London would have been the area in the Addison Bill but for the opposition of those who did not understand the subject.

A delegate from Tilbury, in seconding the motion, said the proposition of a £9 subsidy did not meet the situation satisfactorily. Such a burden should not be placed on shoulders already overladen.

Mr. H. H. Brown, Town Clerk, of Gravesend, said the proposal would be futile, because the Council of the Association of Municipal Corporations had accepted the subsidy terms laid down. But in any case he would vote for the resolution, because he was convinced, after carefully studying the scheme, that it was doomed to failure from the start, and if they could succeed in getting the contribution from the Government put up, which would inevitably be accompanied by an additional contribution from the rates, it was the quickest way of killing the whole wretched business.

Mr. Aldridge then asked that they should not condemn the scheme because it was not satisfactory in every respect. In rural areas many labourers paid 2s. 6d. a week rent for houses which were not worth 6d. They proposed to give a three bedroom cottage at a rent of four or five shillings a week plus rates. It was right that the labourer should pay the rent. Given proper conditions to refuse to pay 5s. was not economy but lack of economy. The scheme represented a real step towards the solution of the problem.

It was decided to postpone voting on the resolution until later in the meeting.

Another delegate, Mr. Dobson, said people who could afford to build houses should be compelled to do so.

The Conference then considered the following Report, prepared by a representative Committee appointed by the National Housing and Town Planning Council:—

REPORT ON THE SUPPLY OF SKILLED LABOUR.

It is beyond question that one of the most important factors determining the rate of progress which can be attained in the execution

of a national housing policy of the magnitude required, relates to the extent of skilled labour available in the building industry. That there is a serious shortage is generally acknowledged, and the definite relation of this shortage of supply to the rate of progress which can be attained, stands registered in the fact that the officers of the Ministry of Health before granting subsidies to local authorities adopt the practice of calling upon the local authority concerned to submit an estimate of the number of skilled men whose energies are locally available for the building of houses. In considering the case the officers of the Ministry of Health also bring into consideration the figures recorded in the returns of the local labour bureau relative to unemployment in the ranks of skilled craftsmen. Unless this problem of the shortage of the supply of skilled craftsmen can be made good it will be futile to hope that the number of houses built in the next few years will bear any relation to the real housing needs of the nation.

The numbers of skilled craftsmen engaged in Great Britain in the building industry in 1901 and January, 1924, are, respectively :—

	1901.	1924.
Bricklayers	.. 120,288 ..	57,170
Masons	.. 97,398 ..	22,270
Carpenters and Joiners	.. 306,355 ..	125,010
Slaters	.. 16,111 ..	5,210
Plasterers	.. 36,238 ..	16,070
Plumbers	.. 76,065 ..	34,440
Painters	.. 176,007 ..	106,860
	828,462 ..	367,030

Dealing with the causes of the shortage of labour the report says for many years past the number of apprentices flowing into the industry has been insufficient in volume to replace the depletions in the industry. The gravity of the situation in this regard can be gathered from the fact that the census figures for 1921 showed that there were then in training only about 21,000 apprentices for the crafts of bricklayers, masons, carpenters and joiners, slaters and plasterers. The number of skilled craftsmen in these groups (which leave out of the reckoning plumbers and painters) was, roughly, about a quarter of a million.

They find that there is a difference in various parts of the country concerning the proportion of apprentices to craftsmen which might be in training under existing agreements between employers and operatives. The custom seems to vary from one in three to one in five. It seems that there is also a tendency to limit, in some areas, the total number of apprentices which any one industrial concern may have in training. But if the proportion of one in four be adopted as a fair average then it would seem that there could have been under existing agreements in 1921, about 60,000 apprentices in training for these groups of industries with the approval of both employers and operatives—*i.e.*, about 40,000 more than there actually were then in training.

There is, unfortunately, no reason to believe that the situation has substantially improved during the past two years. Passing on to consider the reasons for this shortage of apprentices the evidence obtained tends to show that they are as follows : (*a*) The unwillingness of parents to place their children in an industry which does not offer steadiness of employment at a good standard wage and differs in general attractiveness from careers opening out in other industries. (*b*) The absence of any kind of responsibility—falling on the employer—for securing and training apprentices. (*c*) The entire cessation of apprenticeship during the war.

It is to be regretted that no workable solution has yet been found for "wet time." How serious a problem is presented in this regard can be seen from the fact that it has been estimated that in the period covered by October, November and December, 1923, the average number of hours worked by bricklayers in Scotland was only 25 per week. The Committee are of the opinion that many parents have prepared to send their children into industries which offered greater steadiness of employment at wages which, taken the whole year round, were substantially higher than those likely to be secured in the building industry. For example, it is clear that in many cases parents have preferred to apprentice their children to engineering firms because the prospect of constant work at regular hours in a modern well-equipped machine shop was far more attractive than that of continually shifting from one job to another, even under the same employer. The Committee find, moreover, that parents have been tempted to send their boys into "blind alley" unskilled occupations in which they have been enabled to earn higher wages than as apprentices, and contribute at an early age to the expenses of their maintenance.

There has been a substantial depletion in the number of skilled craftsmen arising from (*a*) migration to other industries in times of depression in the pre-war period ; (*b*) losses to the industry during the war period as a result of death or migration to other industries ; and (*c*) emigration to other countries, both before the war and since the war.

In considering the number of operatives needed to build 200,000 houses a year, two points emerge, viz. :—(*a*) the number of skilled men necessary to build a stated number of houses ; and (*b*) the proportion of the men in the industry needed for the performance of building operations other than those relating to the construction of small houses. With regard to (*a*) two sets of estimates have been considered by the Committee. The first of the sets of estimates has been supplied by Mr. Platt, the Housing Director to the Manchester City Council. It is understood that his figures represent actual experience relative to the number of men occupied in building houses on one of the Manchester Corporation Building Schemes. Number of craftsmen needed for 200,000 houses per year :—

Bricklayers and Masons ..	43,600
Carpenters and Joiners ..	41,200
Slaters	4,120
Plasterers	15,680
Plumbers and Glaziers ..	7,940
Painters	15,200
	127,740

The second set of estimates relates to the number of hours normally worked by all classes of labour in the construction of a small house. It is understood that an analysis of a large number of housing schemes carried into effect during the past three years reveals the fact that from 1,600 to 2,500 hours of labour per house represents the general range of time taken. (These figures include the hours worked by labourers as well as by skilled men.)

The committee recommend that the Government should be asked to make a clear declaration of determination to carry into effect a long-run housing policy. It will be of value in this relation to point out that the securing of an adequate number of apprentices will largely depend on : (*a*) the eagerness of parents to apprentice their children to the industry ; and (*b*) the good will of employers and operatives alike. Neither of these factors can be made the subject of compulsion. Unless both employers and operatives are assured that a steady period of prosperity will ensue, all endeavours to secure a rapid increase in the number of skilled craftsmen will be doomed to failure. It is further recommended the number of apprentices in training should be brought up to the level of a number mutually agreed upon between employers and operatives. All builders engaged on public work, either national or local, or engaged in building houses in respect of which subsidies are given should be required, as a condition of their contract or the receipt of the subsidy, to train a specified proportion of apprentices. A central committee of employers and operatives should be set up and be charged with the definite duties of arranging for the recruitment of apprentices and the provision of adequate facilities for their training.

New apprenticeship schemes, the operation of which shall be limited for a certain agreed period of time, should be formed with, as their definite object :—(1) The placing aside of the present ratio of apprentices to craftsmen in favour of a new ratio to be mutually agreed upon ; (2) the training of a certain number of apprentices (whose age is greater than the present agreed age of 16) for a shortened period of not less than three or four years, the amounts to be paid by the employers to these older apprentices to be supplemented by grants made by the State ; (3) the modification of certain restrictions at present in operation governing the number of apprentices allowed to be in training under any one employer. It may be explained that recommendation (2) is put forward on the definite plea that a substantial injustice will be suffered by many of those who were of the apprentice stage during the Great War and who either volunteered or were drafted into the Army, or served in munition work during this period. It is argued that there has been quite enough suffering arising out of the war without condemning men who would otherwise be skilled craftsmen to remain in the position of unskilled labourers for the whole of their lives. Sympathetic and constructive consideration should be given to the valuable suggestions that the crafts of the building industry should be regarded as falling into four great groups or divisions, and that provision should be made for the concentration of the energy of the craftsmen coming within the limits of these four groups on the performance of work in regard to which delays in execution must seriously prejudice the activities of craftsmen in other groups. It will be generally recognised that the craftsmen of the industry fall within the following groups :—(1) carpenters and joiners, (2) plumbers and heating engineers, (3) bricklayers and plasterers, masons and slaters, (4) painters and glaziers. With regard to group (3) it may be pointed out that already the bricklayers and masons belong to one union. There is also a strong feeling throughout the industry as to the desirability of setting up a Trowel Trades Union. In support of this proposal it may be urged with much force that in the Eastern Counties bricklayers, in accordance with the custom of the area, do plastering work.

A system of insurance on a contributory basis or otherwise, should be set up and should provide that time lost in inclement weather should be paid for, if not in full, at least in part. Various improvements should be made in the status of the craftsman and in the conditions of employment with the definite object of making the industry more attractive.

Dealing with the Report, Mr. Aldridge said the main decline in the building industry between 1900 and 1914 was unemployment. In the Middle Ages, the Craft Guilds of the building industry were the most representative, but during the last twenty-five years men had been leaving the industry and parents taking the view it was the last industry in which to place their children. It had been said that the absence of apprentices was due to opposition from workmen ; but it was not so. With regard to recruitment by means of apprentices, the whole thing resembled trying to run a Great Northern train by means of a Stephenson "Rocket" engine. The whole system was in desuetude. With regard to dilution, they came to the conclusion, apart from the fact that neither operatives nor employers wished it, that it would bring strife into the industry. They came to the conclusion the need to-day was the proper recruitment of the industry by means of apprentices. They required a constant stream of apprentices, not merely boys, but young men. Such a reorganisation as would enable them to secure thousands a year. But to secure these apprentices they must have a long-run housing policy so as to remove for ever the fear of unemployment. He was delighted to tell the conference that there had been a unanimity of opinion that the key to the whole situation rested in the creation of new labour by the means of apprentices. They did not wish to lower the standard of craftsmanship. Boys must have better training. It would pay to spend millions on technical schools. In village and town alike they had got to have new methods of training—training such as they had never had before.

e Chairman then proposed the following lution: "That this Conference expresses ral approval of the proposals contained in orandum No. 32 of the National Housing Town-Planning Council relative to the ease of the supply of skilled labour in the ding industry. Further, this Conference es a special stress on the need for action g taken by housing committees and educa- al committees of local authorities in each to secure that a workable scheme for the ease in the number of apprentices is drafted administered." He urged special stress he need for action being taken by housing mittees and educational committees or l authorities in each area to secure that rkable scheme for the increase in the number pprentices was drafted and administered. aid he knew where there had been requests placing boys as apprentices to trades, but l a few days ago there was no application behalf of a boy to enter the building trade ing a period of ten years. Lads had been to earn higher wages in other directions, and ents had not apprenticed them to a trade. delegate thought that, if the local authorities erfered with such a technical matter the trade ons would have something to say.

Ir. Aldridge said the suggestion was not one interference. The local authority had not the right, but also the duty to see that there uld be the necessary labour for the houses. al authorities must take their share of re- nsibility. They were in the position of wards who had the right to see that there s a constant stream of labour to carry on the rk.

Mr. White (Battersea) said the question that icerned boys most of all was that of money. u could not give all the blame to the building de of London. In many ways there were trictions. They could not take a boy of teen years of age unless he had been to a trade hool. The operatives said they did not ject to boys, but as a matter of fact they did. A delegate from East Ham said, as an opera- e engaged for 26 years, it was not correct say they were to blame for the shortage; ey tried to encourage boys in the industry. ie master plasterers had said the builders uld not take apprentices. They could have id 40,000 more in the trade if the builders ould have taken them. However, if they had terference from local authorities it would upset th employers and operatives. If they left it the Committee, in conjunction with the inistry of Health, they would be able to train ie boys, and the local authorities would have safeguard; it would settle the issue.

The Town Clerk of Wimbledon said he con- dered the recommendations most unwise. The cal authorities had to take the view of the iembers of their council, and in practice it ould amount to interference with the building rade. Unless the builder entered with enthu- iasm into the scheme it was doomed. He id not consider in these days that it could be onsidered the legitimate function of the local uthority to travel outside their sphere and nforce their will on the building industry. As epresentatives of local authorities it would be nwise to commit themselves to interfere in a rade union organisation.

Mr. Chisholm (Hackney) asked if it were not ossible to find a way out of the difficulty etween builders and operatives. If they would give what was required, surely there was some way out. People were cooped up worse than rabbits in hutches, and yet they were discussing the question of securing apprentices. What they should do was to ascertain whether it was possible to erect temporary houses which would not require the skilled bricklayer. Why not use the labour of unskilled men who served in the war? While supporting the scheme, he did not see how it was going to work with the great shortage of labour. Efforts should be made to meet the present situation by tem- porary dwellings.

A delegate from Gravesend said they wanted houses at the present time; and to produce apprentices competent to carry out the work would mean the elapse of an appreciable period. Operatives worked from 8 to 5, and his opinion, as chairman of the Housing Committee, Gravesend, was that the "output was not what it should be." Prices at Gravesend had gone up by leaps and bounds, and they could not get men to turn the work out. Let operatives work two hours a day more at, of course, the same scale of pay.

Mr. Stewart, Barking, said the general opinion was in favour of the first paragraph of the resolution, but difficulties had arisen in connection with the second. The difficulty was that men in the educational world looked with perturbation at the added duties which would be thrust upon them if the recommendation were carried into practice. He could not imagine any education committee viewing the proposal with favour.

The Mayor of Aylesbury said, as a member of a local authority, he did not consider it wise to shoulder them with the responsibility as to whether the builders had enough apprentices. He did not think for a moment they would meet the difficulty of housing by temporary dwellings; they wanted something that would stand. The object of the conference was to send representatives back to local authorities inspired with enthusiasm commensurate with the seriousness of the problem. If they were sent back saddled with another burden he did not think the authorities would go on with building.

A delegate from Wallington said the state of the country was such that the public must arbitrate between the builder and the operative. The local authorities were overburdened, but how could they accomplish their work without the local authorities? It was no good facing the housing problem with pessimism.

At this stage a delegate endeavoured to deal with the shortage of materials, but was ruled out of order.

The Chairman, in reply to his resolution, said they wanted houses, and could not continue indefinitely in their present position. Let them have the same effort in peace as in war.

An amendment submitting that the second part of the resolution be deleted was lost. The resolution was altered, however, in favour of action being taken by "a national committee acting through the Housing Committees and Educational Committees of local authorities," and was carried in this form.

Mr. Edwards then pressed for a vote on his motion that the State subsidy proposed in the Government Housing Bill was inadequate. He reiterated that Barking had to ask for an increased subsidy. They were not planning to upset any scheme, but why should the local authorities be penalised? He would ask them about the shortage of materials, and why a tender of £436 had recently been withdrawn. The motion was lost by 26 votes to 30.

The following resolution of Mr. H. H. Brown (Gravesend) was lost on an amendment by the Town Clerk of Wimbledon:—"That where a local authority is meeting the need for houses and can prove to the satisfaction of the Minister of Health that adjoining authorities are not taking adequate steps in a like direction, it shall be competent for the Minister to levy on such adjoining authority by way of a special rate such contribution as they may deem just and equitable in all the circumstances."

Mr. Aldridge then put the following resolution to the meeting:—

"That this Conference desires to protest against the limitations of the maximum measurement prescribed under the Financial Resolution on the Housing Bill to 950 super ft. for the building of 2,500,000 houses providing homes for 12,500,000 people. It urges all Members of Parliament, irrespective of party, to secure amendment of this provision, leaving to the wise common sense of the local authorities what standards can best be adopted for their areas."

The resolution was then put to the meeting and carried.

Mr. Aldridge then briefly dealt with the remainder of the Agenda.

The National Housing and Town Planning Council some time back issued the following memorandum relative to the standards of design and lay-out of housing schemes:—

The houses should be broad, rather than deep, in order to secure that all the rooms shall have ample light. This will involve the giving of increased frontages, but the additional cost can be met by economy in road construction under modern town-planning conditions. Back extensions are better avoided, and all the rooms should be brought under the main roof. Three bedrooms should be provided in all the new houses. There are hundreds of thousands of two-bedroom cottages in existence, and the members of the committee, therefore, took the view that the cottages now to be built should be of the three-bedroom type.

The houses should, as a rule, be provided with parlours; the working people of this country know what they want in this respect, and the great majority desire the parlour cottage. Each house should have a bath, with provision for hot water supply, either in a separate bathroom or in the scullery. Ample window space should be given, and the windows should be carried as near to the ceiling as possible. Where the by-laws do not already demand it, an impervious layer of concrete, or other approved impervious material should be laid under all floors to prevent damp rising, and the proper damp-proof course should be provided for all walls.

DARTFORD LAND ACQUISITION

The Official Arbitrator's Awards.

Mr. J. D. Wallis, Official Arbitrator under the Acquisition of Land (Assessment of Compensation) Act, 1919, has issued his awards in claims against the Dartford Urban District Council, concerning the Council's acquisition of land and houses for the southern by-pass road and other improvements.

Mr. James Thomson and Mr. Walter Thomson (Executors of Mrs. Betsy Thomson, deceased) claimed in respect of the freehold premises, Nos. 85 to 101 (odd), Hythe-street, and Nos. 56 and 57, Home Gardens, Dartford. On behalf of the claimants, Mr. H. Dann submitted a valuation of £7,662, while Mr. A. B. Thornton, district valuer, on behalf of the Council, detailed a valuation of £3,700. The Arbitrator has awarded that the acquiring authority is to pay to the owners the sum of £5,045 as purchase money and compensation, and to pay the fees on the award, and £60 towards the costs of the owners.

Mr. J. W. Ellingham claimed for land situate in Shepherd-lane and Lowfield-street. The Arbitrator has awarded that the acquiring authority is to pay to the owner the sum of £888 as purchase money and compensation, and to pay the fees on the award, and £30 towards the costs of the owner.

Mr. W. E. Miles and Miss Ethel Isabel Miles claimed in respect of the Council's acquisition of an area of farm land. The Arbitrator has awarded that the acquiring authority is to pay to the owners the sum of £708 as purchase money and compensation, and to pay the fees on the award, and £20 towards the owner's costs.

In regard to a claim by Mr. W. E. Miles, the acquiring authority is to pay the claimant £448 as purchase money and compensation, and to pay the fees on the award, and £25 towards the claimant's costs.

Town-Planning Institute.

At the meeting of the Council held recently the following offices were filled by unanimous election: President, Mr. W. T. Lancashire; Senior vice-president, Prof. P. Abercrombie; Vice-president, Mr. W. R. Davidge; Honorary vice-presidents, Messrs. J. A. Brodie, Rt. Hon. Neville Chamberlain, M.P., A. Norman Garrard, Sir Aston Webb; Honorary librarian, Mr. E. G. Allen; Honorary auditor, Mr. E. J. Elford; Honorary secretary and treasurer, Mr. G. L. Pepler; Representative of honorary members on the Council, Capt. G. S. C. Swinton; representative of Associates on the Council, Sir Richard Paget, Bart.

THE BUILDING DISPUTE

THE National Federation of Building Trades Employers decided recently upon a national lock-out on July 5 if the operatives do not undertake in the meanwhile to adhere everywhere to the agreements or awards governing wages, hours of work, and overtime.

The chief difficulty is at Liverpool. There for some time past the employers have negotiated local agreements with the operatives, which secured them higher rates of wages than those paid in London.

The recent conference of the employers was called to ratify the recent agreement, but the alleged violation of the conditions laid down in agreements, and particularly the failure of the operatives' federation to secure the adhesion of its Liverpool members to the new agreement, led to the opposite course being taken.

The operatives' leaders state that the employers' decision is a repudiation of the decision of a negotiating body, which they understood had authority to conclude an agreement. They mention that the operatives may not wait to be locked out, but may go on strike.

The resolution adopted by the employers was as follows:

This meeting of the National Allied Building Trade Employers resolves that, as the conditions laid down in Articles 5 and 6 of the letters sent to the Operatives' Federation on May 14 by our Negotiating Committee—namely, that the recommendations, which are to be taken as a whole, are entirely conditional upon the termination of deliberate breaches by the operatives of the National Wages and Conditions Council Constitution, including the summer working hours, overtime regulations, the refusal of Scottish operatives to put into effect constitutional awards; and that the provision stated by the Negotiating Committee in their letter of May 5 with reference to Liverpool be adhered to, including a formal acceptance of the National Working Rule Agreement, constitution and award, of the National Wages and Conditions Council by the Liverpool operatives—have not been carried out, all offers are withdrawn, and that there shall be no further negotiations carried on unless and until all branches of operatives have complied with the conditions contained in the aforesaid letter; and that a national cessation of work shall take place as and from July 5 next for the object of insisting upon the observance of national agreements.

The executive committees of the unions forming the National Federation of Building Trades Operatives met on Tuesday to consider the notice of a lock-out. The following official statement was given:—

The executive councils gave full consideration to the ultimatum declaring a lock-out of building trades operatives on July 5. The conference expressed amazement at the decision of the national employers not to honour the agreement negotiated between the two national committees on June 16. This decision has struck a smashing blow at national negotiations. A committee has been appointed to draft conditions for conducting whatever dispute may take place.

As we go to press it is stated that the operatives' federation has decided to accept the employers' lock-out notices, and not to precipitate matters by declaring a strike. The employers were to hold a meeting late on Wednesday evening to fix the date for the lock-out notices to take effect.

The Stanlee Shipbreaking and Salvage Co., Ltd., H.M. Dockyard, Dover, are supplying teak from old battleships, including blocks for parquet flooring, planed, bevelled, and dovetailed, ready for fixing. The firm has also a large stock of second-hand materials suitable for the building trade. Full particulars will be sent on application.

RATES OF WAGES IN THE BUILDING TRAI

The following are the rates of wages in the building trade in England and Wales. endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occu

	Completed.	Under construction.
1919 Act	22,081 ..	2,841
Private subsidy schemes	2,324 ..	—
Slum clearance schemes	452 ..	1,351
1923 Act	200 ..	3,419
	25,057 ..	7,611

Of the total number of houses completed and under construction under the 1923 Act, 1,396 are by the local authorities and 2,223 by private enterprise.

Aberdeen's Stone Houses.

At a meeting of the Aberdeen District Committee recently, the sub-committee reported that in their view the great bulk of the houses being constructed in the district were not for the relief of the inhabitants in the district, but were being constructed by persons mainly resident at present in the city of Aberdeen. They considered that there was no real scarcity of houses of the class contemplated by the Act for the inhabitants af the district, and were of the opinion that houses built of brick were unsuitable for construction in that area, owing to the weather and other conditions. They recommended that the Committee should decline to alter its terms. The Chairman commented on an interview he and the Clerk had with the representatives of the Scottish Board of Health, when they were told that they were the only local authority in Scotland which insisted that houses under its subsidy scheme must be built of stone and lime, and had not given authority to build either in stone or brick. They thought that the Committee were very selfish in keeping back building by ordering the builders not to use brick.

Fires.

Damage estimated at several thousands of pounds was caused by a fire which broke out recently in the works of the Falkirk Iron Company.

NEW BUILDINGS IN SCOTLAND.

Glasgow.—BUILDING.—A sum of over £50,900 has been raised for the erection of a new building in connection with the Glasgow Hospital for Diseases of the Ear, Nose and Throat.

Buckie.—SCHOOL.—The Banffshire E.C. has accepted tenders for the erection of a new High School at Buckie. The total cost is £26,059.

Kirriemuir.—BUILDING.—The Dean of Guild Court has approved of plans of a building to be erected in the Glengate, and which is to be used as a convalescent hospital. Mr. C. D. Souuar, of Dundee, is the architect.

Perth.—HOUSES.—The Finance Committee of the T.C. has requested the clerk to apply to the Board of Health for sanction to borrow £25,000 for the erection of houses at Dunkeld-road.

Nitshill.—HOUSES.—The Housing Committee for the Upper District of Renfrewshire has decided to apply to the Board of Health for permission to erect 205 houses under the provisions of the 1923 Housing, &c., Act. They propose to allocate the houses as follows :—Nitshill, 50 houses ; Neilston, 50 ; Thornliebank, 25 ; Busby, 30 ; and Elderslie, 50.

Coatbridge.—VARIOUS.—The following plans have been passed : Councillor T. Rankin, alterations at 11–15, St. John-street, at an estimated cost of £1,700 ; Mr. G. Jamieson, wine and spirit merchant, 4 and 6, Whiffletstreet, alterations at the cellar and lavatory accommodation at his premises, at an estimated cost of £200 ; Mr. R. Detroia, a shop at the Red Bridge, Sunnyside-road, at an estimated cost of £300 ; Mrs. Pettigrew, 58, Drumpellierstreet, a bungalow in Drumpellier-street, estimated to cost £900 ; Mr. Coia, confectioner, Main-street, a saloon and house three stories high, at an estimated cost of £2,500; and the Rev. Father Geerty, alterations and improvements to St. Patrick's Hall, St. John-street, at an estimated cost of £1,000.

* The information given in this table is copyright. The rates of wages in the various towns in England and Wales are given on page 1042.

CONTRACTS, COMPETITIONS, &c.

Forsome contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders: and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

PROPOSED NEW BUILDINGS & OTHER WORKS *

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; P.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

ABERDEEN.—Plans passed by T.C.: House, Anderson Drive, for Mr. William E. Gauld, architect; house, Queen's-road, for Mr. A. B. Hutchison (per Messrs. Brown & Watt, architects): reconstruction of 805, Great Northern-road, for Mr. Alexander Webster.

ABERYSTWYTH.—The T.C. is to erect six dwellings at Gogerddau-place. Mr. T. W. Powell, shop and house at Portland-road site. Plans passed by T.C.: New shop and premises in Portland-road, for Mr. D. Williams; new mains in several streets, for the Electric Light Co.; new station buildings, for the G.W.R.

ALDEBURGH.—The R.C. congregation are proposing to erect a new church, estimated to cost £5,000.

ALTRINCHAM.—A sub-committee of the E.C. recommends the establishment of an open-air school for invalid children, and that the C.C. should provide the school.

ARMFIELD.—The U.D.C. have approved of plans for the erection of 26 houses at Carmyers, for the South Derwent Colliery Co. The U.D.C. themselves also propose to erect further houses at Catchgate, subject to sanction of the M.H.

ASHBURTON.—The Devon C.C. has appointed a sub-committee to consider proposals from the Grammar School Governors with regard to the provision of a new house for the head-master, with accommodation for boarders.

ASHTON-ON-RIBBLE.—The Parochial Church Council of the Parish Church are proposing to erect a mission church and institute, for the district of Ingol, on a site in Tag-lane.

BAKEWELL.—The committee of the Bakewell and District War Memorial Cottage Hospital have decided to carry out a scheme of extensions by providing an additional wing with the additional accommodation for the staff, at an estimated cost of £1,000.

BARNSLEY.—Plans passed by T.C.: W. Storrs, bungalow, Westbourne-grove; W. Storrs, two bungalows, Wombwell-lane, Stairfoot; James Hartley, house, Burton-road; F. W. Oxley, eight houses, Dodworth-road and Keresforth-avenue; R. Goodworth, two houses, Dodworth-road.

BARNSTAPLE.—Devon C.C. has prepared plans for a pavilion at the grounds of the Hawley Sanatorium, so that 24 additional patients may be accommodated, at an estimated cost of £1,936.

BARROWFORD.—Messrs. J. & J. H. Boothman are proposing to erect three pairs of semi-detached houses in Gisburn-road.

PEMBROKESHIRE.—The County Small Holdings Committee is to erect a house and set of outbuildings at Keyston. The St. Dogmael's R.D.C. is to proceed with the reconstruction of the Temple Bar-Jericho-road, at an estimated cost of £22,300.

PENRITH.—Plans passed by U.D.C.:—Bungalow, Fell-lane, for Mr. Wm. Priestman. The Surveyor is to prepare a report, with plans and estimates, for the provision of a maternity home. A water scheme, to cost £3,000, is being considered by the R.D.C.

PITSEA.—A site has been acquired by the Roman Catholic congregation for the proposed erection of a new church.

PREESALL.—Plans have been approved by the D.C. for proposed houses in Pilling-lane, for Mr. J. Aspden, Mr. H. Atkinson, Mr. T. E. Ford and Mr. W. Butler.

PRESTON.—The Preston Women's Citizen's Association are to be informed by the Maternity and Children's Welfare Committee that steps are being taken with regard to the establishment of a maternity home. The Streets and Buildings Committee propose to sett pave the unpaved portion and repair a portion of the footpath of Stanleyfield-road, subject to the Infirmary Board giving a piece of land in order to widen the footpath.

PUDSEY.—**Plans** passed: House at Heath-grove, for Mr. F. Pick.

RADCLIFFE.—The D.C. and the Clifton & Kersley Coal Co., Ltd., have agreed to acquire a site off Albion-street as a housing site, on which it is proposed to erect between them 100 houses. The district surveyor has prepared a lay-out plan of the site. The provision of shops on the site is to be considered at a later stage.

RHYL.—Sanction has been received by the T.C. for the proposed improvements at the Waterworks.

SALTBURN.—The Roman Catholics have acquired a site of 1½ acres, overlooking Hazelgrove Park, upon which it is proposed to erect a new church.

SANDBACH.—The T.C. have approved a plan for a sewer to be laid in School-lane, Elworth.

SELBY.—The U.D.C. are to approach the M.H. asking their approval of a larger site for the purpose of erecting a new junior school in New-lane, as the site previously approved by them was insufficient for the size of school required.

SIDMOUTH.—The U.D.C. has passed plans:—House at Woolbrook, for Mr. D. Fitte; house at Lennox-avenue, for Mr. R. W. Sampson; house at Woolbrook, for Mr. B. North.

SKEGNESS.—The Lindsey C.C. have sanctioned the erection of a new secondary school. A site has been purchased.

WHITLEY AND MONKSEATON.—Plans approved by U.D.C.: Three pairs semi-detached villas, Abbotsford-park and Kenilworth-road, for A. L. Hastings; three pairs semi-detached houses, Queen's-road, for Calderwood, Chapman & Co.; house, junction of Ashbrook and Pykerley-road, for Mr. M. Cheeseman; two houses, Helena-avenue, for H. J. W. Robinson; shop and house, corner of Ilfracombe-gardens and Kew-gardens, for H. D. Burton; house, Marine-gardens, for Mr. W. Milne; house, Beverley-park, for R. & A. P. Tait; three pairs of semi-detached villas, Cliftonville-gardens, for H. & S. Alderson; three pairs of semi-detached villas, south side of Davison-road, Whitley Lodge Estate, for R. Woodman; three pairs of semi-detached villas, east side of Swinbourne-gardens, for A. Lisle; six pairs of semi-detached villas, east side of Brundon-avenue, Whitley Lodge Estate, for G. Bell; pair of semi-detached villas, 12 & 14, The Gardens, for A. L. Hastings pair of detached villas, Deneholm, for Gofton Bros.; pair of semi-detached villas, south side of Grosvenor-drive, for J. R. Dagg & Son; house, south side of Hillcrest, for D. J. Murray; bungalow, Meadow-road, for Miss Wilson; pair of bungalows, Oaklands-road, on West Monkseaton Estate, for the Creighton Construction Co.; two pairs semi-detached villas, Davison-road, for J. M. Dawson; pair of semi-detached bungalows, Claremont-road, for Potts & Canning; pair of semi-detached villas, junction of Davison-road and Brundon-avenue, for R. Woodman; pair of semi-detached villas, Hillcrest, for F. Holmes; four pairs of semi-detached villas, Davison-road, for C. Mather; pair of terrace houses, Richmond-terrace, for W. S. Bonner; pair of semi-detached villas, Brundon-avenue, for R. Woodman.—The Surveyor has prepared plans of private street works, to cost £4,500.

WOODFORD.—Plans passed by U.D.C.:—Four houses in King's-avenue. A town-planning scheme is suggested for part of the district.

OVERCROWDING IN THE ARCHITECTURAL PROFESSION

MR. H. G. SWANN, London, writes:—

SIR,—I was very interested in reading the report, issued by the Executive Council of the Architects' and Surveyors' Professional Union, concerning the overcrowding of those professions. It is writing from the point of view of an unarticled pupil concerned purely with the architectural profession that I have made the following notes:—

It is suggested in the report that the professional bodies should obtain greater control over the schools, and in return afford more generous recognition. It is difficult to see how this greater recognition can be given considering that students of many of the recognised schools are, after their course, exempted from all the R.I.B.A. examinations except the short paper on professional practice.

Also, it does not follow that unarticled pupils often enter the ranks of the semi-skilled. Frequently the parents are not in a position to provide a course of training in a school or to article their sons, so they, desirous of entering the profession, have to do so by the only course open. Is the lack of means for the above purposes to prevent those, probably of equal ability compared with others in more fortunate circumstances, from entering the profession? If the unarticled pupil has any ambition, there is no "perhaps" as to whether he attends evening classes. He is out to learn quite as eagerly as the articled pupil or school student.

With regard to the recommendations in the report, No. 2 appears to disregard the fact that ability can be found amongst those not in a position to be articled or attend a recognised school. In which case, why should employment be denied?

No. 5 recommends that all those desirous of entering the above-mentioned professions and who are resident within one hours' railway journey of a recognised school, be not allowed to enter an office direct, but first attend this school. This is impossible for many parents to provide, so are their sons to enter other professions, for which they, probably, have no inclination, because of these suggested restrictions?

No. 6 also advocates that no pupil or student enter an office or school without first matriculating. To provide the necessary education is again beyond the means of many parents, and is one likely to be a better architect for passing this examination?

The whole question appears to hinge on one point, *i.e.*, is the lack of means to provide training at a recognised school or for articles to prevent capable persons entering the profession in other ways? If it is desired to control entry, I suggest that scholarships be instituted by the professional body concerned, namely, the R.I.B.A., for the architectural profession. This scholarship to take the form of an examination in subjects likely to be of use in professional matters. One scholarship to be attached to each recognised school, and to be competed for by intending entrants to the profession from each surrounding district. An agreed number at the head of each list to be adjudged winners, each of whom would receive a grant sufficient to cover necessary expenses during the tenure of the scholarship at the school.

Although I am in favour of registration and a closed profession, all classes of intending entrants should be allowed and on pure ability to be judged if eligible for admission.

Builders' Estates.

Mr. Elphinstone Forrest, builder and contractor, "Laurel Bank," Myrtle Park, Crosshill—£13,352.

Mr. Charles Bragg, Solihull, Warwickshire, chairman of Bragg Bros., Ltd., building contractors, £18 982.
